HARPER'S
NEW MONTHLY MAGAZINE.

No. CCLXXVII.—JUNE, 1873.—Vol. XLVII.

CHEAP YACHTING.

CHEAP YACHTING IN BUZZARD'S BAY—TEMPE'S KNOBS IN THE DISTANCE.

THE day of wooden and sailing vessels, for purposes of war and commerce, has probably passed. Only twenty years ago, the boys of America, more especially those of the North Atlantic coast, used to read with pride, and repeat with enthusiasm, the exploits of Paul Jones, Decatur, Hull, and Perry, the heroes of our infant navy. We knew by heart the stories of the old *Bonhomme Richard*, the *Constellation*, the firing of the *Philadelphia* at Tripoli, the saucy *Enterprise*, the ill-fated *Chesapeake*, and the immortal *Constitution*. Of the merchant marine we fondly cherished the names of those noble clippers, the *Sovereign of the Seas*, the *Dreadnaught*, the *Red Jacket*, and a host of others, the fastest in the world, and eagerly flocked to the wharves to gaze at them when they came to port. Cooper and Marryat were our favorite authors in fiction. *Midshipman Easy*, *The Pilot*, and Dana's *Two Years before the Mast* were our delight, and presented to the youngsters who longed to be afloat a fair picture of the sailor's lot.

But the romance is now all gone from poor Jack's life. He is only an ill-paid,

Entered according to Act of Congress, in the year 1873, by Harper and Brothers, in the Office of the Librarian of Congress, at Washington.

overworked laborer. His old enemies—land and water sharks—still survive; but the rollicking, generous, brave Yankee tar is disappearing. The next generation will only see of him the absurd caricature that appears on the stage, and will infer that the Ancient Mariner was, for the most part, a lunatic.

The new era of machinery and iron will, no doubt, benefit commerce, and produce more highly educated and scientific officers; but the fireman and the steward's boy can no longer hope to carry out the venerable old rule, "Go in through the hawse-hole to get to the cabin." To the seaman of the old school these steamers and iron-clads, without top-hamper or sails, are an abomination and a curse. His occupation is gone, and he must vanish from off the face of the earth. None felt this more keenly than noble Farragut, who, from the time he first smelled powder on the *Essex* till his last cruise was done, ever loved a tapering mast and a swelling sail.

The outlook for the future is not encouraging. It has always been the policy of the United States, until now, to have in time of peace a small fleet, but a good one. We had few vessels, but they were the best of their kind. The frigates and sloops we sent to sea in the war of 1812 were larger, better manned, and more powerfully armed than any of their class in the British navy. Hence the glorious results. This policy was begun during the Revolution, and has only recently fallen into disuse. The *Princeton*, the *Susquehanna*, the *Niagara*, and the *Merrimac*, with her sisters, were intended to be the most formidable men-of-war of their rates afloat. At the present time we have not a ship in the navy worth boasting of.

Our mercantile marine, as we all know, is choking to death.

Are the United States, then, to leave the ocean, and confess themselves an unmaritime nation?

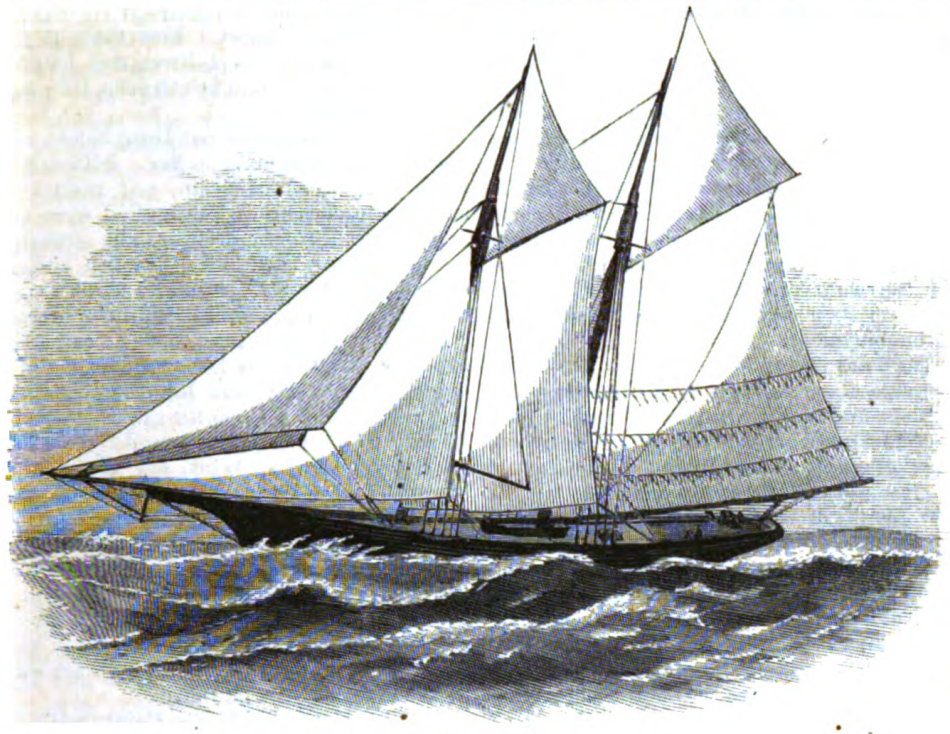
This question has been happily answered by the spirit of individual enterprise. The honor of the American flag has been maintained by the New York Yacht Squadron. We still stand at the head of the world for speed, model, rig, and elegance of schooner yachts.

The first decked vessel built within the old United States of which we have any account was constructed on the banks of the Hudson, during the summer of 1614, by Schipper Adrian Van Blok. This vessel De Laet terms a yacht. In this "yacht" Blok passed through Hell Gate into the Sound, and steering eastward, discovered a small island, which he named after himself,* going as far as Cape Cod by the Vineyard passage.

The two-masted, fore-and-aft rig was first adopted by the hardy Cape Cod mariners, and the schooner is essentially a Yankee craft. Neptune forbid that the long-worn garland of fir be plucked from the brows that so long have carried it!

Whatsoever shall encourage the youth of the present day to love the sea, teach them to brave its fancied dangers, or arouse in them a desire to excel in the art of navigation, must be of benefit to the whole country.

To the New York squadron is due the credit of having, during the past twenty years, so largely increased the interest of Americans in yachting, that the victories of our pleasure craft have become matters of national concern. Our fleet schooners have raced across the Atlantic, gained cups in the British Channel, roamed among the West India Islands, and laid their bones on the reefs of the Mediterranean. Not content with this, their adventurous owners now plan voyages around the world, and long wanderings among the genial isles of the Pacific.



The sport, however, is deemed so costly that of the many thousands who admire and long for it, only a few hundreds have found a way to compass their desires. Those who have neither a fortune nor the friendship of a yacht owner generally content themselves with reading exciting accounts of regattas and cruises in the newspapers, or listening to the stirring stories of luckier men. Many treat themselves to a steamboat excursion to a fishing-bank with a large and strange crowd. Some form clubs, charter a coaster, and crawl from port to port in the Sound and on the Eastern coast. All these plans have their charms, but want the essential elements of a true yachtsman's enjoyment. He commands his vessel, and is responsible for her. He goes when he pleases, returns when he chooses, and changes his course whensoever he deems fit. To start with the wind, not knowing how far you will go—to make a harbor only when the weather or your own caprice dictates, with no other will to conflict with yours, no surly or lazy skipper to obey, and no fellow-passenger's equal rights to consult—this is true pleasure-sailing. Add to the above the study of winds and currents, buoys and beacons, ballast and trim, sail and helm, and anxiety about rocks, ledges, squalls, and fogs, and you have genuine yachting.

Supreme command, ample time, an observing mind, and a spice of danger, are requisites of an entirely happy cruise.

The *Sappho*, *Dauntless*, *Magic*, and others of the class that have made our national reputation, doubtless cost their owners from twenty to fifty thousand dollars a year. This enormous expense is within the means of so few that the mass of the community think pleasure-sailing a pastime only accessible to

THE "SAPPHO."

the very richest. Yet any man of moderate fortune may keep his yacht in summer for a trifling sum, provided he has an ardent love of salt-water, a cool head, and a steady hand.

It was my fortune to land in England in 1851, just after the *America* had beaten her fleet of British rivals, and to behold the astonishment of the English at so unexpected an event. John Bull was fair-minded, however, and gave unstinted praise and hearty congratulations to the Yankees. Probably many an American dates from that victory the beginning of an intense eagerness to excel in all water sports.

The summer of 1870 found the writer, blessed with plenty of leisure, in the fair city of New Bedford, at the mouth of Buzzard's Bay, on the southern coast of Massachusetts. This old whaling port is too well known to need description. The inhabitants and visitors who carefully explore the harbor and neighborhood declare its attractions superior to those of Newport.

I there made an attempt to solve the problem of cheap yachting, urged by reasons that usually impel men to do things cheaply. I could not afford any great expense, and I was determined to have a cruise. Previous experience on fishing and sailing parties had shown that no mere passenger can ever learn to manage a sail-boat except in very light breezes. If there is a skipper, he always takes the tiller as soon as any skill is required. If amateur sailors are all the crew, they are constantly meddling, advising, and disconcerting, unless some one is "facile princeps." I therefore determined to be captain of my boat. As it must necessarily be small, only one companion could well be taken along. But as a green hand might become timorous, and I should be held responsible for his safety, and as an old hand would laugh at blunders, or mutiny in case of danger, I decided to go alone.

A voyage of this kind, however, must not be undertaken without careful study and preparation. A rash start may result in speedy disaster, and cool one's courage for the future. I first made many trips about the harbor in a row-boat, fixing bearings and buoys in my memory, exploring all shallows and rocks, and shaping out in my mind's eye the whole basin where two feet of water remained at all tides. Careful attention was given to the prevailing winds, to places where flaws from the land might be dangerous, to signs of fog, and the run of the tides. Nor were the best fishing-grounds for tautog and scup neglected. The impetuous blue-fish, too, was courted, but without success.

The next step was to go out sailing with a skipper, watch his movements, analyze the manœuvres of jibing, luffing, running off and on the wind, and learn the proper way of reefing, anchoring, and shooting into the wharf. After a week or two of mental training like this, of pulling a heavy row-boat fifteen or twenty miles a day, and

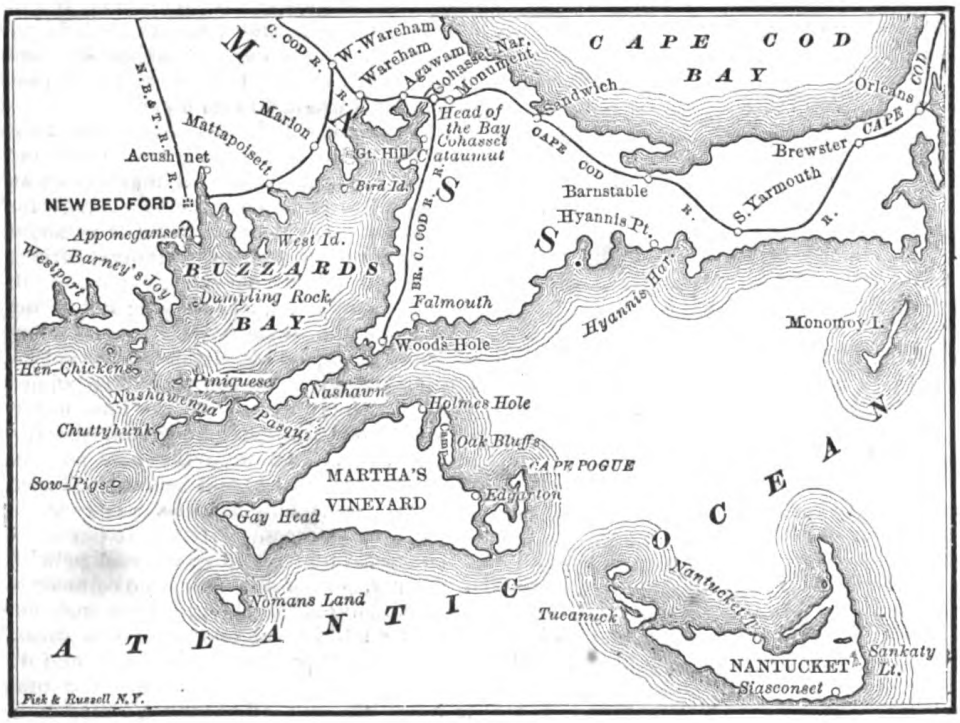
swimming in rough water, a man is ready for any adventure.



The outfit for the voyage was then fixed upon with studious care. Old army experience was here a great help. The same rule was adopted as when starting upon a march. First gather together all you think you want. It will be an unwieldy mass. Throw out every thing you can possibly dispense with, then something more. Now add one luxury that you are sure will console you for the want of useful articles discarded. You are then equipped for hard work and calm enjoyment.

Here are the articles of prime necessity: the oldest and thickest suit of clothes you possess, and a few changes of under-clothing, ancient army woolen and India rubber blankets, a great-coat, and a Coast Survey chart—all in a tight valise or canvas bag; a few pounds of hard-tack and boiled meat in a box, and a gallon of water. Let the last be carried in a large wooden keg, with a small nozzle and stout handle, and only half full. Haply this keg shall prove a life-preserver in case of capsize. It is on record that a Sandwich Island woman once swam twenty-eight miles to the shore from a foundered vessel with only the help of a ship's bucket.

The luxury I chose was a set of fishing implements, selected with care at a first-rate dealer's. A well-balanced bamboo rod, a multiplying reel, two hundred yards of linen bass-line, with a small box of swivels, hooks, spoons, and such gear, are enough to insure delightful sport. You may, if you choose, add a few hand-lines and bait for still fishing. He loves not the sea who neglects the angler's art.

The boat was picked out long before, and several trial trips made in her. Fifteen feet in length, broad of beam, cat-rigged, of eighteen inches draught, decked over forward, with a roomy cockpit, she promised to be buoyant, stiff, and quite fast enough to suit a beginner. With a stout kedge and line, a pair of oars to make ash breezes with, baggage and stores stowed carefully, the tiny yacht hoists her sail at noon of a bright August day, and hugging closely a light southwest air, gently glides from the wharf. "Where are you bound?" is asked. "I don't know." "When are you coming back?" "I don't know," is again the answer. Slowly crawling under the lee of the New Bedford shore, past Palmer's Island, where, by-the-way, a gem of a hotel might be built, we make for mid-channel, my yacht and I. The ripple under the bow becomes a streak of foam, soft rocking changes to quick nodding to the choppy waves, and we are soon at the mouth of the harbor.

On the right is Clark's Point, with its famous shell road, and the stout little granite fort at the southern end. It was here the British landed during the Revolution, and marching toward the town, surprised an ancestress of mine, fleeing from her house with the most valuable piece of property she

could think of in the emergency—a pair of bellows!

Beyond are Apponegansett, Dumpling Rock, with light-keeper, famous for chowder, and the line of coast stretching westerly toward Westport, Rhode Island. Southward lie the Elizabeth Islands, light blue in the distance. On the left is dingy Black Rock, sterile West Island, and a low shore, gradually rising hazily in the direction of the upper bay. The southwest breeze is coming straight from the open sea, and shapes our course; so, slacking the sheet, we bound gayly before it up the bay.

Before proceeding farther I will devote some space to the most important preliminary of successful water voyaging.

In order to fully enjoy the land and sea about us, and even for safety's sake, we must first learn how to handle a boat skillfully.

Once out in the middle of the bay, I began to realize how different theory is from practice. With all my previous observation and attention to detail, I soon found myself at fault. A heavy sea was rolling in, the wind was rising rapidly, and the boat rushed over the tops of the waves with startling speed, pitching into the trough beyond as if she intended diving to the bottom. In all my experience hitherto there had been an extra man to take in sail, but now I had to stay by the tiller, and the halliards were made fast forward. If the rudder were left for a moment, we should broach to and capsize, and there would be nothing but the water-butt to continue the cruise with. I did, indeed, try coming up to the wind for a second or two, and was so near going over that I once for all learned the folly of that manœuvre. There was nothing for it, apparently, but to keep straight on or get the sail down. Waiting for a lull, I sprang to the halliards, let them go, and got back just in time to save a catastrophe. But, alas! I had forgotten a very important precaution. I had not overhauled my running rigging. The rope was old and spliced, and would not run through the blocks. The sail still kept up, and pulled like a runaway horse. Here was a dilemma—a choice between rolling over and turning a somersault. Vainly I yawed the boat and jerked the sheet; the obstinate canvas would not take an inch. The situation was getting serious, and desperate measures became necessary. Lashing the tiller hard a-starboard, I made a frantic rush forward, and threw my whole weight upon the bolt-rope. I thought it would never give, but just as the boat jibed and the boom got inboard, down came the sail, and we lay like a log upon the water. Thankful for safety, and glad not to have any witnesses of my blunder, I took the lesson to heart. Thereafter all my running rigging was made fast to after-cleats, and kept free. I afterward asked a well-known and experienced boat owner and fisherman of those waters, with a view to getting instructions for future use, what he would have done if he had got caught in such a scrape. "I wouldn't 'a got caught in it," said he, with vast disdain; and not a word more did I get out of the trusty but somewhat crusty skipper.

If the art of sailing, like that of war, is best learned from our own mistakes, I must have pretty effectually mastered it during the summer. Going before the wind is easy enough, if you mind the helm well; but the knack of getting full speed while running close to the wind, without making too much leeway, is only acquired by long practice and close attention. There is no more pleasing sight than to watch a thorough seaman beating against a head-wind, and there is nothing more absurd than a novice's effort to do the like. At first I spent hours in doing what afterward took only half hours. I jibed ship when I hadn't the slightest intention so to do, much to my astonishment and dismay. There is something thrilling in the first jibe. It is no joke. You find the boom coming inboard as gently as a feather, and before you have had time to wonder why it does so it springs over the other side like a catapult, hitting your head, perhaps taking a turn of the sheet about your legs, and leaving you thankful you are not pitched overboard.

On starting from a wharf it is not advisable to turn round and wave adieux to your friends, or you may do as I did once, and run into another boat moored close by. The skipper said nothing, probably because there were ladies present, but his face was sad and his look was unkind, and until I had rounded the point I felt uncomfortable and sheepish, for until then I could see him standing upon the wharf, leaning against a post, with an expression on his countenance of mingled contempt for my awkwardness and pity for the inevitable drowning that must soon overtake me. It is well not to anchor on the flats, at high tide, for a nap. You may find yourself high and dry for hours after you awake.

To tack gracefully is most essential to proficiency in navigation, and one goes through a series of most provoking failures before acquiring this accomplishment. To miss stays and have to scull round into the wind with canvas flapping and boom swinging furiously is highly mortifying, especially before company. The beginner, however, will have to endure it many times before he finally learns to get the sails properly full, to put the helm down gradually, and to keep off judiciously when fairly around. To avoid collision, with the least possible deviation from one's course, is still harder. At first I used to be disturbed by vessels that were miles away, and would run away in the most undignified manner from any thing near by, whether I had the right of way or no. Once I threw the an-

THE SKIPPER OF MARION.

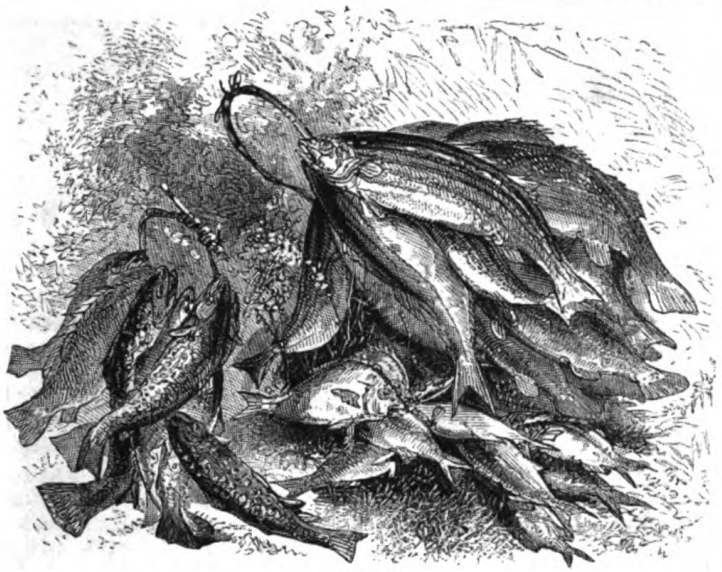
chor overboard without making the cable fast to the boat.

Such are some of the trials I went through before I felt entirely at ease in my boat. Many days and more than one cruise were needed to accomplish this result. Boat sailing is an art that no amount of reading, theoretical instruction, or observation can teach. Every man must learn it for himself, by practice, in good weather and bad, by day and by night. Once acquired, it is the source of healthful recreation and most exquisite pleasure.

Now, gentle reader, if you are not weary of the preliminary disquisition, pray give me your company to the pleasantest cruising-grounds in all America. Let the squadrons of big yachts show their speed and prove their strength in waters of deeper blue: we will creep along the shores that entranced the Norsemen centuries ago. No inlet shall be too shallow for us, no harbor too narrow, no island too small to land upon. We will be joyous explorers by sea and shore.

Turning the head of our yacht to the northeast from New Bedford Harbor, we bowl merrily up the bay. That big black buoy you see so far out from shore marks the end of a reef stretching out from West Island. Larger craft have to go outside. We will run over without a care. Look down and you will see the big rocks all about us. Yonder, on our port bow, is a spindle, the sign of a lone rock, and beyond is Mattapoisett light-house, with the town. Do you not like these Indian names? The coast throngs with them, such as Cataumut, Potomska, Cohasset, Wamsutta, Acushnet, Agawam. Round about us you see many skiffs at anchor, fishing for tautog, sea bass, and scup. We shall try for nobler game by-and-by.

You notice that the breeze is strengthening. It is the prevalent air hereabouts in summer, and almost always freshens in the afternoon. It comes cool from the ocean, and makes the climate of this region delightful in summer.



That light-house ahead is on Bird Island, and stands guard at the entrance to the upper bay. We are now near Marion Harbor, and will anchor off the point to fish a while. If you wish to catch tautog, let your sinker lie on the bottom, and don't pull the line until the fish runs away with the hook. For scup keep your bait off bottom, and jerk lively at the bite. They do not afford much sport, but are delicious eating. Now that we have a mess, we will make a port at Marion, which lies at the head of the picturesque cove ahead. The inhabitants foolishly changed the name of their town from Sippican a few years ago. They are, nevertheless, a kind and hospitable people. We can get our fish cooked and find good beds at a farmer's house for a trifle, or go to the Bay View House, a cottage-like hotel, which is fast becoming a summer resort for oppidans.

You are badly sunburned and cramped by sitting so long in the boat, but you will soon get used to it.

Dawn of the next day finds us creeping

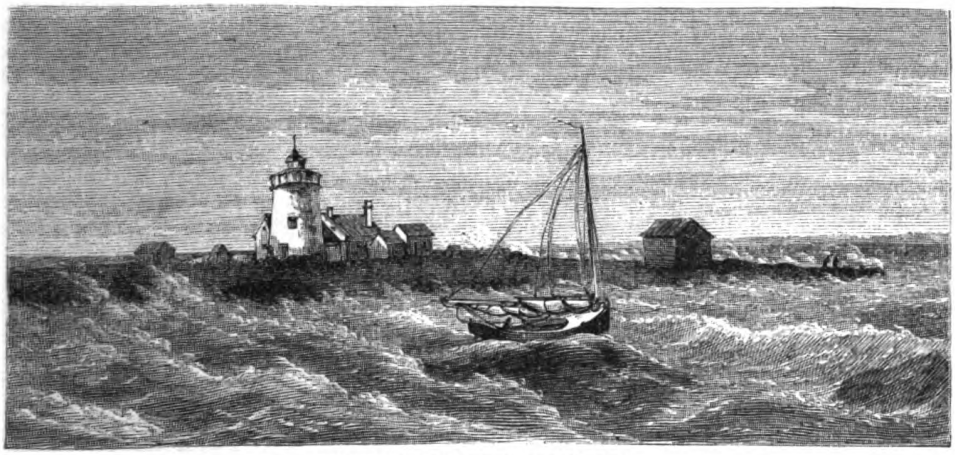
slowly toward the mouth of the land-locked harbor, and past the exquisitely picturesque little island which guards its mouth, with a light air from the north-east, which dies away and leaves us becalmed for a few hours. We improve this opportunity for a swim. The water is delightfully warm, and you may stay in as long as you like without chill or languor.



SOME FISH.

The usual south-west breeze now lightly blows. It will last all day, so we will run out into the bay and try our luck with the blue-fish. The fishermen about here use hand-lines and eel-skin "drails," as they call their trolls. They get more fish, but have none of the fun of playing them. I shall try my new spoon-hook. To joint the rod, attach the reel, and have fifty yards of line out is the work of a moment. Steering close to the wind, I easily regulate our speed, and await the sport with tiller in one hand and rod in the other. Suddenly down goes the point of the rod, and out flies the line. Ha! he's hooked; he breaks water; a six-pounder at least! He tugs viciously; he runs deep; he leaps frantically into the air. It is worth a week's journey just to play that fish. Slowly the winding reel draws him to the side. Beware of his last flurry near the boat. He gets a little line while I haul in the slack of the sheet, but at last is safely brought to gaff. Look out for his teeth: he can bite like a mad dog. Hurrah! we are in the middle of the school, and the new spoon works bravely. Will you try your luck, my friend? Let the rod lie easily across your left arm, and keep your thumb on the band to check the line. Now you have him hooked. Don't give him any slack, nor be too eager to reel in. Take time, but make him feel the spring of the rod. See! there's another one trying to get the spoon away from the first. They say about here that if the blue-fish jumps up and shakes his head at you, it means that he is not coming aboard. He certainly has a queer knack of getting rid of the hook. When you hear your spoon jingle you may bid good-by to the fish.

The epicure tells us to bleed and draw the blue-fish at once, and to cook and eat him as soon thereafter as we can. We accordingly land on Bird Island, where the cheery light-keeper, always glad to see strangers, gives us a broil such as no city table can boast.

The island is separated from the main-

LONG PIER, MARTHA'S VINEYARD.

land by a shallow strait, with a reef of rocks stretching almost across. I ran through there once in a gale of wind, with a line of breakers from shore to shore. I got into Marion Harbor, drenched and exhausted, with my boat half full of water, and have wondered ever since why I wasn't dashed to pieces. It was fiercely exciting, and my life was insured, but I wouldn't try it again.

As the sun begins to sink we hoist sail for Great Hill, which looms up almost grandly five miles ahead. On a point at its foot stands the Marion House, a prominent building, standing in bold relief against the hill. With broad piazzas on three sides, and long windows, all overlooking the water, the building serves as a landmark for all the adjacent waters. No better base of operations can be chosen by those who wish to explore the upper bay.

Before sunset we will climb Great Hill. Though not much to brag of as a hill, it looks down quite proudly on the flat country hereabout. The view from the top is charming. Far to the eastward stretches the cape—Cape Cod—so dear to the heart of the Yankee, low and sandy, dotted with villages. You can trace the windings of a score of inlets, each with its little clump of masts. Southeastward lies Falmouth, a favorite trouting resort of Webster, who loved the cape best of all the earth, and was as happy as a boy when he could go on a trip like ours. That smoke at the northeast is from the foundry at Agawam. It is one of the oldest in the country, and cast guns for our forefathers in the Revolutionary war. But the sun has gone down, and so must we. You may, if you choose, pass the night at the hotel. I long to sleep in the open air again. It will bring to memory the happy army days of 1861–1865. I scud up the neighboring creek to a land-locked basin, anchor under the lee of a beautiful grove, and roll up in the faithful blankets that first did service in Virginia. The sighing of the wind through the trees, the gentle ripple of the tide, lull me. I take a last look at the stars, and sleep like a tired soldier once more—

> "Canopied by the blue sky,
> So cloudless, clear, and purely beautiful
> That God alone was to be seen in heaven."

In the morning we run up to Wareham, famous for its oysters, a quiet town, but full of industry, and a heavy importer of coal. Here we will go ashore for a day, and I will take you to some fresh-water ponds in the neighborhood, where black bass and pickerel abound. First we will visit the State fish-hatching establishment in Agawam. A drive of four miles brings us to a small, low, wooden building, in a wild nook, spanning a narrow brook. Therein we may watch the life of a trout from the time he leaves the egg till he is a foot long, and able to take care of himself. The young fry are kept in shallow porcelain boxes, arranged in descending rows, each box overflowing into another, a little below. As they grow the fish are transferred to protected pools and branches of the stream, the different sizes being kept apart, as nothing is so fond of trout diet as the trout itself. Under the floor of the house is the basin for large fish. Take up a plank and give them some min-

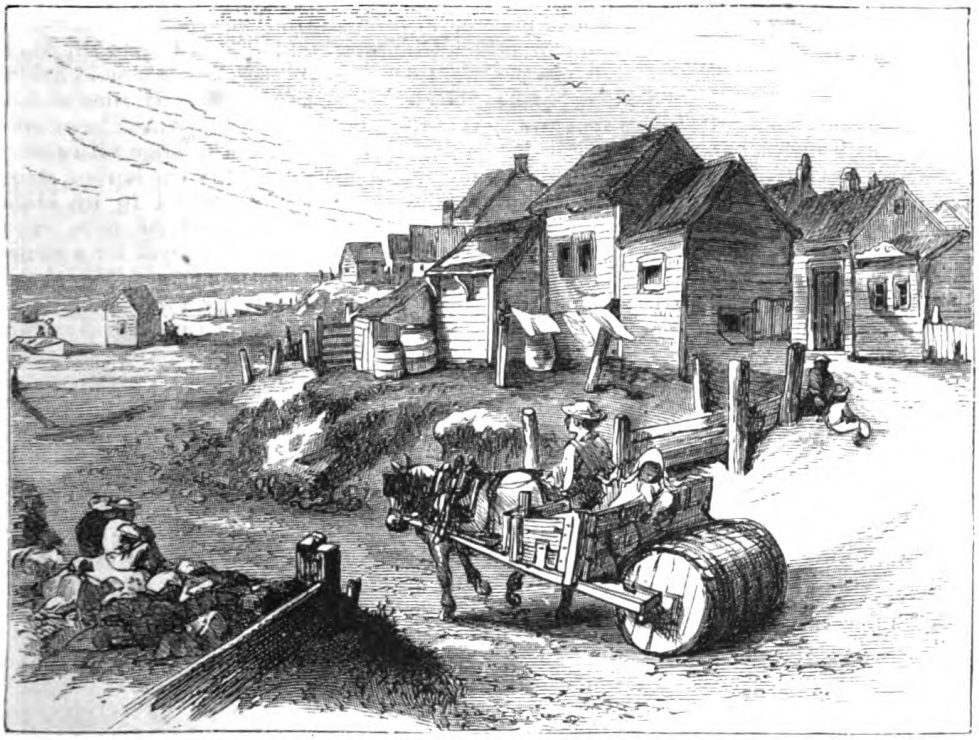
nows. They are tame as kittens, and leap at any thing you offer, be it your hand or your nose. Many have little numbered silver tags fastened in their backs. These are taken out every season and weighed, to measure their growth. Some of them have been to sea to exhibit their ornaments, and come back to the old home.

From here we turn off into a by-road, not wide enough for two teams abreast, and make our way through the Plymouth woods, low stunted growths of oak and pine, very like the Virginia Wilderness, to a pond whose name we will not reveal. Is it not a gem? It is as nature made it. Not a sign of man's presence offends the eye. How clear and pure the water is! how fresh and bright the foliage! Long before the Pilgrims landed it was as it is now. From yonder wooded bluff Massasoit has doubtless watched for game, and on this sandy beach the deer still slake their thirst at eve.

Five years ago these waters were secretly stocked with black bass, which have thrived and increased prodigiously. The guide draws from a hiding-place in the bushes a light row-boat, and pulls slowly along the shore, while we get the tackle ready. Bend on two single gut leaders, one hook baited with a gaudy fly, the other with a live mummy-chog. There! what a rush that fellow made! He's fast to the minnow. Did you ever see a fish leap so high?—four feet, at least, into the air. Gently; give him the butt. Look out! You have another on the fly. He pulls his comrade quite out of water when he jumps. They often break water four times before they tire. What game beauties they are! Reel in steadily. Now I have them both in the landing-net. Both together do not weigh more than seven pounds.



This powerful fish comes from the Northern lakes, and is so greedy of fight as well as of food that the ferocious muskallonge and pike are unable to conquer him. Common pickerel keep out of his way, and no trout can live in his neighborhood.

We might spend a week in this region, whipping the streams for trout and paddling about the numerous ponds. To-night we will stay at a farm-house, and in the morning drop down the channel to the bay again.

On the left, as we glide out from Wareham River, is a high bluff, called Tempe's Knob. Along the base is a favorite ground for blue-fishing and sailing parties. In the calm moonlight nights of summer here you will see dozens of row-boats, loaded with merry parties, awaking the echoes with music and laughter.

Our next port is Cohasset Narrows. The bay here dwindles into a narrow and tortuous river up to the railroad crossing, and then spreads out into a broad sheet, called Buttermilk Bay. Then come Gibbs's Narrows, and another shallow flat, which is the head of the bay.

It is best to get in early. I once tried to run in here after dark. The weather was

LIGHT-HOUSE, SANKATY HEAD, NANTUCKET.

cloudy, with squalls from the southeast. At times the moon would shine out brightly, but for the most part the night was as dark as a pocket. I explored inlet after inlet in vain till after two o'clock, and then anchored under the lee of a bank and turned in, but was awakened by a visitor from the shore, who fancied I might be an oyster-thief. He was quite amused at the idea of my being out on a pleasure excursion, and evidently thought me a lunatic after his theory about the oysters had been upset.

From the wharf at Gibbs's Narrows, and from the bridge at Cohasset, large numbers of striped bass are caught. At the latter place enthusiastic anglers may be found from May to October. The tide runs between the piers like a mill-race. In the September gale of 1869 the solid stone piers were swept away, and the old bridge destroyed. The elevation of the roadway gives a fine chance to strike and play the fish. They are generally small, but an occasional twenty or thirty pounder gives zest to a whole season. A club from Boston has a house near by.

A mile away to the southward are the village and river called Monument. As there is no structure in the vicinity bearing any resemblance to a monument, the name is probably a corruption of the Indian Monumet. A ship-canal from this point to Cape Cod Bay has been talked of these fifty years. The United States government has agreed, it is said, to build a breakwater and pier at the northern outlet. State aid has been invoked, and surveys been made, but there are no signs that the project will ever be realized. The canal would save coasters a voyage around Cape Cod, and much danger in winter, but capital does not seem to have enough faith in the profits of the scheme to subscribe for the stock.

During the war of 1812 a large part of the commerce between New York and Boston was carried on by small craft creeping down the coast to Sandwich, transhipping their loads to Monument, and continuing the passage in the same tedious way along Long Island Sound. Passengers were often weeks on the way.

We will now take advantage of the northeast breeze and make a long stretch to Wood's Hole, a strait between the main-land and Nashawn, taking care to reach it while the tide is flowing out, or we should not be able to stem the current. It runs so fast that the large channel buoys are almost submerged. We whisk by the ledge with alarming speed, and passing by the harbor, shoot into a lovely basin, hedged in by bluffs crowned with tasteful summer-houses. Here we take leave of the continent for a while. As the wind is fair, let us run across to the camp ground on Martha's Vineyard. What a wonderful collection of tiny houses strewn about helter-skelter, like toys forgotten by children! Poor and rich flock here from all parts of the country to get a day, a week, or a month of sea-air and bathing, according to the length of their purses. You may peer into tents that have done duty in the Army of the Potomac, and find the familiar contrivances of the old soldier brightly bedecked by the tasteful handiwork of his wife. You may gaze boldly into the open doors of the most aristocratic homes without giving offense. It is said that in the crowded season as many as forty thousand people dwell in these cottages by the sea.

I fear the best days of this watering-place are gone. Simplicity is fast disappearing. Tall, pretentious, and gaudy structures are

going up as dwellings and hotels that will ere long take away from the camp-meeting the great charms of lowliness and humility. If it should once become fashionable, its doom is sealed.

We must not leave the Vineyard without a look at Edgarton, a quaint old fishing and whaling town. On a long pier that stretches out into the sea the fishermen bold and lasses bright make their evening promenade, in the proportion of about ten of the latter to one of the former.

Let us now put our boat in charge of a wharfinger, and make a trip by steamer to Nantucket. It will take only a day. The town and harbor have a decrepit and decaying aspect. In former times large ships came in over the bar, and here were the head-quarters of the whalers till New Bedford grew up. No visitor should neglect the drive to Siasconset, a miniature village of low one-story cottages in the southeastern corner of the island. Perched on a bluff that the broad Atlantic is constantly washing away, street after street has been swallowed up by the sea. You may see a house with its back-yard half gone, another overhanging the cliff, and still another moving inland to a safer resting-place.

At Sankaty Head, farther north, is a tall light-house, and the huts of two hermits—ancient mariners, tired of the world, but still fond of old ocean—waiting their summons to "go aloft." Though living near together, they do not affiliate. Indeed, I am told that each one looks at the other as a disreputable fellow and no genuine hermit, thus showing that seclusion and self-contemplation do not always beget humility. The one is, or rather was—for he is since dead—an Englishman, whose history was unknown to the natives—a converted and repentant pirate, some called him. The other is a Nantucketer born, driven from the busy marts of commerce and the vortex of society on the other side of the island by a difference of opinion with his spouse. An inspection of their huts shows a marked contrast. One is neat and light, with a small vegetable garden. I found on the

GAY HEAD, MARTHA'S VINEYARD.

wall an old cut from *Harper's Weekly*, picturing a skirmish in which your humble servant was wounded. The mention of this fact, and pointing out the most prominent figure as my own, excited some interest in the old recluse; but his talk was mainly of "fifty year agone." The other is an old curiosity-shop, crammed with odds and ends of all sorts—a fit den for Quilp, within; without, it is dingy and weather-beaten, and surrounded by trophies of whales' vertebræ hung up on poles. The southern coast of Nantucket makes many wrecks in the course of the year, and a melancholy sight, at the rear of the town, is the stranger's grave-yard, only too full of unknown sailors, found drowned.

We must not fail to read the *History of Nantucket*, written by a Quaker named Macy. The Quakers, being in great majority, declared the island independent and neutral during the Revolution, and were heartily cursed by the Continentals for cowardice and trading with the enemy. A British boat's crew, however, having helped themselves too freely to provisions without paying, were served with a copy of resolutions of a town meeting, to the effect that the Friends would, in all love, lay hands upon them and thrust them forth, if these depredations were not stopped.

I also read somewhere that in the war of 1812 the famous Yankee privateer *Prince of Neuchatel* fought several British men-of-war off the south coast, and that the inhabitants all fled from that part of the island, in horror at the shedding of blood, and the ruthless deeds of men of wrath, putting their fingers to their ears to keep out the angry sound of the cannon. An old lady, however, who was present at the action, assures me that the latter statement is utterly incorrect, and that the shore was crowded with people, who watched the combat to the

end complacently, and rejoiced at the final escape of the bold privateer.

During the rebellion Nantucket furnished hundreds of men to the army and navy, who did their duty nobly, and the island is now truly loyal.

The Isles of Shoals, off the coast of New Hampshire, are now the only portion of our territory in open secession.

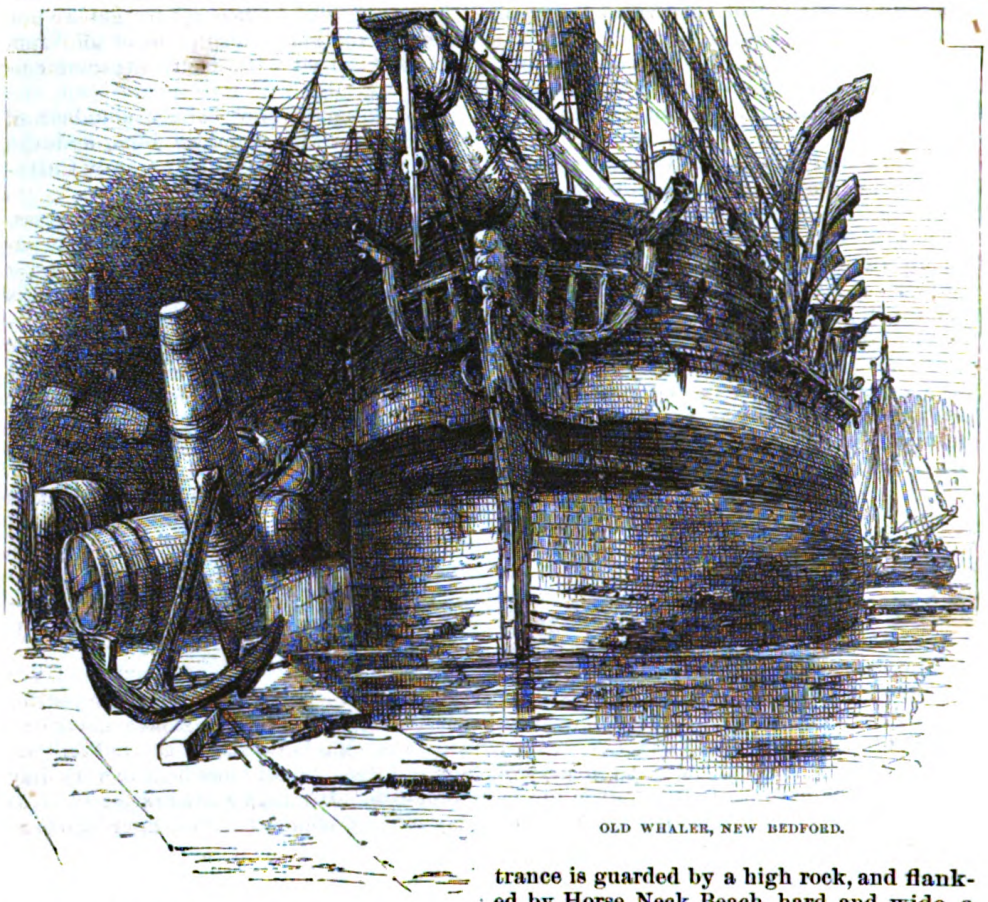
From Edgarton we start in time to catch the tide on its westward flow through the Sound. A host of coasting schooners, and mayhap a large yacht or two, bear us company. The breeze is just light enough for our little boat, and we make good time past Nashawn, whose well-wooded hills bid fair to show us, before many years, a picture of the Elizabeth Islands as they first appeared to the Scandinavian explorer, green with lofty trees to the water's edge.

On barren Pasqui, yonder, is a club-house, where, weary of the city's din, many a New Yorker revels in idleness, salt air, and bass-fishing.

The tide is turning, so we will pass through Quick's Hole, and make a harbor for the night on the north side of Nashawenna. This island, of soft Indian name, is a great sheep pasture, and is fast regaining the forests so improvidently cut down by the first settlers. In an old farm-house of the last century we find the hospitable owner's son deep in agricultural lore, but ready to give us a shot at the birds, a pull at the fish, or accompany us on a tramp over the hills.

From the highest summit we get a view of Gay Head, the western point of the Vineyard, gay indeed with many brilliant colors in the light of the setting sun, the mighty Atlantic, now calmly slumbering, all Buzzard's Bay sapphire blue, and the extreme islands of this chain, sandy Cuttyhunk and Piniquese.

On a lower ridge, amidst the tall grass, we discover a group of mounds, with headstones so weather-worn that "sacred to the memory of" men who died a hundred years before we were born can scarcely be deciphered. All these islands were thickly peopled in the seventeenth century, and the township of Goswold was of no small importance; but now Cuttyhunk is perhaps the only one that can boast of any natives.



How delightful is the night's rest in this ancient homestead! The wind whistles cool and shrill about the eaves; a wood fire gives a welcome glow; drowsiness creeps on apace. By the going down of the sun and the rising up of the same our sonorous slumbers are measured.

This morning we will try our luck for striped bass. This is the best ground for them in the country, but it was never my luck to catch a big one, so I can not tell you how it feels. Small ones behave very like a blue-fish. It must be the best of sport to play a sixty-pounder for an hour or so, as the gentlemen of the neighboring clubs frequently do, with line and hook and rod that

BLUE-FISHING.

OLD WHALER, NEW BEDFORD.

you know he can break at any moment but for your skill and patience.

But the heaviest fish ever taken with rod and reel, I fancy, is the shark. A noted fisherman of the other side of the bay accomplishes this feat by using a wire leader and strong hook, with plenty of menhaden bait. The shark having gobbled the savory morsel in shoal water, is stealthily approached and pierced with a lance. As he does not run far, and is easily allured by more food, the process is repeated till he dies. He is a sluggish fish, and never meddles with mankind in these waters; but his death always gives pleasure to the sailor, especially if the latter has seen his voracious brother of the tropical seas. It is no small exploit to capture him with such slender tackle. Who knows but we shall kill whales by trolling a squid from the mast-head, with a dummy engine to turn the reel and a small howitzer to drive the lance? The steam-whalers of the Arctic Ocean do almost as much already.

Our course is now for the main-land again. We might go westward to Seconnet River, and spend a week in Narraganset Bay, but Newport, Fall River, or Providence is a better base of operations for that cruise. We will run into Westport, a perfect gem of a harbor for small craft. The narrow entrance is guarded by a high rock, and flanked by Horse Neck Beach, hard and wide, a favorite resort for driving and picnics for all the dwellers hereabout. A neat hotel and cottages show the popularity of the spot in summer. Last year the members of a Sunday-school from a town near by camped out here on a Monday, intending to bait the stand at the foot of the rock for a week before casting a line. Alas! on Sunday morning an irreverent fisherman from New Bedford, counting on their scruples on the sacred day, took possession of the ground in a boat, and drew out an enormous load of mighty bass. In vain the party expostulated and implored. The arm of the law did not reach so far, and they dared offer no violence.

But while we are listening to this story, what is that portentous sound, growing more and more distinct and piercing as the shadows fall? The birds of prey, fiercest of their kind, the great American mosquitoes, are upon us, avenging the fish, their brothers of watery cradle. O for a few lines of Homer to describe the rush of wings, the shrill cries, the heavy swoop of tireless squadrons to the charge!

"S'ode a destro uno squillo di tromba,
A sinistro risponde uno squillo....
Ecco appare un drappello schierato;
Ecco un altro...."

The plain English—"Confound it, we must get out from here!"—is, however, best. "In killick!" "Up with the mainsail!" "Pull with a will!" and we eagerly shoot out into the dark, the deep, the much-resounding—ah! best of all, the mosquitoless, sea.

Good reader, why have I till now omitted to mention this direful part of the story? Why did I put you to bed comfortably in farm-houses and sleep out alone by myself? Why have I artfully provided you with pleasant weather, fair winds, and good meals on shore hitherto? It was for fear you might be discouraged by foul weather or coarse fare, and give up a cruise that was delighting you. But now—there's no help for it—you must rough it a little. Besides, as you seemed to enjoy each step forward so much, I wish you to be equally glad to get home again. So we will spend the night awake, under short sail, groping about in the dark. The fog shall dim the friendly lights and hide the line of coast. A drizzly rain from the east shall wet us to the skin and chill us to the marrow. We shall peer into the gloom in vain, seeking for our bearings, anxiously looking out for breakers. We shall sound with the oar, and find no bottom. The next instant we shall bump on a rock, and dismally congratulate ourselves we are not wrecked. With every nerve tense and our hearts in our mouths, we shall pass the weary hours till dawn.

And now that morning has come, the fog has lifted, and the sun come out, as a balmy breeze wafts us up New Bedford Harbor again, even while we hungrily munch our hard-tack and tear our stringy beef, washing them down with stale water, confess that all is fun, the hard as well as the easy part of our adventure. Own up that last night's fatigue and danger and sleeplessness have given a zest to our trip that you would not have missed if you could.

Finally, as you step, sun-browned and hardy, from the little boat that has carried us so far and so safely, into the hot wilting air of the city, pray tell me, will you try it again next year?

> "*I* never was on the dull, tame shore
> But I loved the great sea more and more."

A cruise such as I have tried to picture is not always to be expected; nor should it be attempted without a fair knowledge of boat-sailing and a very accurate knowledge of the coast. It is, in fact, a résumé of a number of trips I have made in the months of July and August. But it is as feasible as delightful to all who will take proper precautions, and in midsummer need take no longer than a week or ten days.

The cost need be no greater than that of board at ordinary, unfashionable watering-places. Stout boats, of sufficient size for two men, may be hired for five or ten dollars a week. Good food and comfortable shelter are easily found for as much more, and there is little need of greater expense, except for luxuries.

From the above scale of prices to that of the highest class of yachts are many steps, yet it is probable that the greatest enjoyment is to be found in the two extremes. In the one there are magnificent appointments, luxurious tables, gay company, and elegant display. In the other are healthful exercise, wholesome fare, silent contemplation, and hardy adventure. In the first are ease for the body and excitement for the mind. In the second, labor for the muscles and food for thought are ever present. In both, the highest degrees of pleasure and instruction may be attained.

All forms of yachting, from the proudest to the humblest, soften the hardest hearts, and give rise in the soul of the true lover of nature to feelings of gratitude and devout worship toward the Giver of all mercies.

THE MARQUIS OF HASTINGS IN AMERICA.

FRANCIS RAWDON HASTINGS, better known in our Revolutionary history as Lord Rawdon, was a son of the Earl of Moira. Born in England and educated at Oxford, he became, in his later years, a distinguished subject of the British realm, whom the government was pleased to honor with important offices and additional titles.

Young Hastings entered the royal army at the age of seventeen years as an ensign in the Sixty-third regiment of foot-soldiers. In the year 1773, when the fires of our Revolutionary war were rapidly kindling, he accompanied that regiment to America, and was stationed a while in Castle William, which guarded the entrance to Boston Harbor. He entered the city of Boston under the command of General Gage, when that officer was there in 1774, charged with the grave duty of closing the port of that offending city to commerce of every kind, by orders of the British ministry.

Boston was then an offending city because its inhabitants, led by pastors and patriots, acted in consonance with their convictions that rebellion against tyranny was obedience to God. It was specially an offending city because its port had been made an enormous tea-pot a few months before, when its patriotic citizens, in the disguise of Mohawk Indians, cast cargoes of tea, taken from British merchant vessels, into its waters, and so committed what was deemed to be an overt act of rebellion. That act greatly incensed the king and his counselors. The ministerial members of Parliament evoked the most terrible roar of the British lion, and one of them raised the factious cry of the old Ro-

man orators, "*Delenda est Carthago*"—Carthage must be destroyed—and applied it significantly to Boston. Gage was sent to act upon the spirit of that cry, and young Hastings, then nearly twenty years of age, was one of his most efficient subalterns in the work.

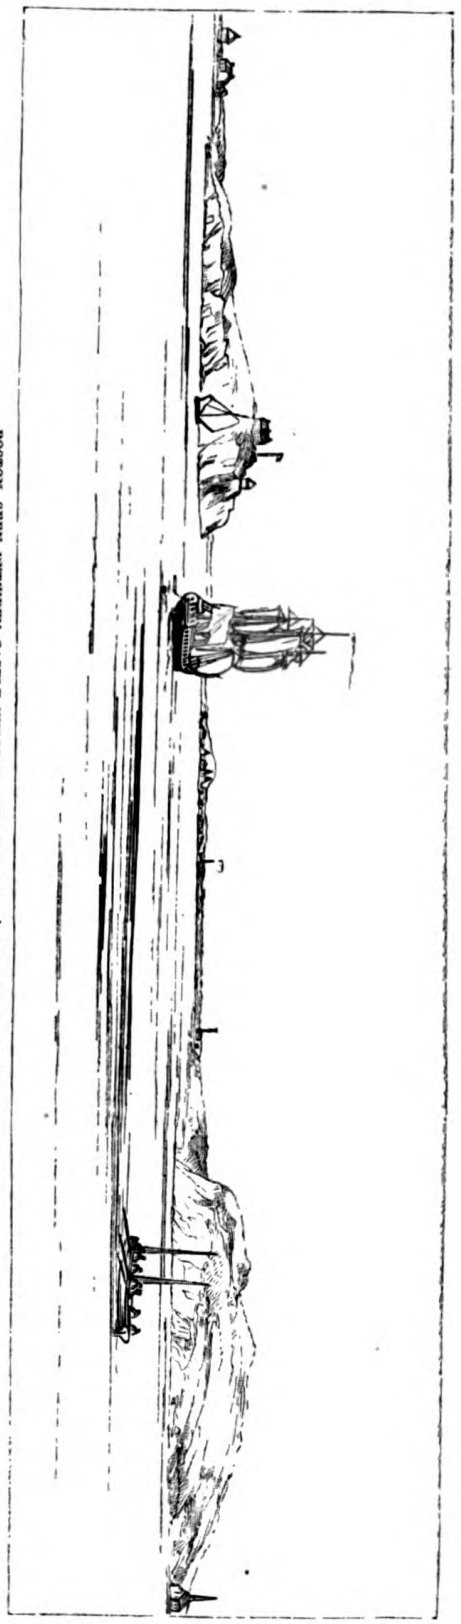
From that time until near the close of our old war for independence, Lord Rawdon held rank among the most active and skillful of the British officers in America. He appears to have been a young man of much observation, and zealous in the garnering of precious facts in his experience while he was in this country. He seems to have obtained from some of the accomplished engineers of the British army a series of sketches, in water-color, of many of the scenes and events in his experience here. A considerable number of these sketches have been preserved until the present time, and in consequence of the unthriftiness of Lord Rawdon's grandson and titular successor, the late Marquis of Hastings, they found their way, some of them into the hands of private purchasers, and others into the public auction-rooms of London.

Some of these sketches are in the possession of Dr. Thomas Addis Emmet, of the city of New York, for whom a part of them were purchased at the sale of the personal effects of the late Marquis of Hastings a few years ago, and others at subsequent sales. They were made by different artists, but evidently at about the same period (1775, 1776), and on the same kind of drawing-paper, for the texture of the materials of all is the same, and each sheet bears the same water-marks. The faithfulness of the drawings has been verified by various tests, and they may be accepted as correct representations of the scenes delineated. They now have a secure resting-place in Dr. Emmet's rare collection of drawings, engravings, maps, and autographs which illustrate American history and biography. It is undoubtedly the most complete collection of its kind in the world; and Dr. Emmet is one of the most generous and liberal of the few Americans who indulge in the costly but delightful and useful pastime of gathering up for preservation such precious grains of the fine gold of our history, which might otherwise be forever lost. To the kindness of Dr. Emmet we are indebted for the privilege of engraving from the sketches gathered by Lord Rawdon the illustrations which accompany this paper—a paper designed to define their relations to our past history.

Before proceeding with our task, let us look at a brief sketch of Lord Rawdon's career.

After serving gallantly as a captain in the Fifth regiment in the battle of Bunker Hill, and with Lord Cornwallis in New York and New Jersey, he was promoted to the office of adjutant-general of the British forces in North America in 1778, with the commission of lieutenant-colonel. He was then only twenty-four years of age. His good conduct at the battle of Monmouth, in June of that year, under Sir Henry Clinton, procured for him the command of a corps in South Carolina, with the commission of a brigadier-general, when he was succeeded in the office of adjutant-general by Major André. After much arduous service in the South his health became so impaired by the malaria of the swamps that he was compelled to depart for England before the close of the war. While on his voyage he was captured by a French cruiser, but was not long detained. Soon after his release he received special marks of the favor of his king. He was commissioned a major-general, and was created Baron Rawdon, with other titles of distinction. In 1793 he succeeded his father as Earl of Moira, and the following year he commanded ten thousand troops sent to relieve the Duke of York in Flanders. After a few years of honorable military and civil service at home, he was appointed Governor-General of India in 1812, in which office he remained until 1822, when he became Governor of Malta. While he was absent in India, in 1816, he was created Viscount Loudon, Earl of Rawdon, and Marquis of Hastings. At the age of seventy-two years, in November, 1826, he died near Naples.

In the first picture of the series here given, entitled "Boston, seen between Castle William and Governor's Island, distant four Miles," the "castle," where Lord Rawdon first landed, is the most prominent object in point of importance and antiquity. It is seen upon a bold island (containing about eight acres of land) on the left of the picture. Between it and the ship is seen Boston Neck, in the direction of Roxbury. To the right of the ship, at the middle of the picture, is seen the town of Boston, containing, at the time this sketch was made, about four thousand houses and twenty thousand inhabitants. Beacon Hill and its flag-staff is above all. Further toward the right is seen Charlestown. Just behind the point of Noddle's Island, and more in the foreground, is delineated Governor's Island, upon which, according to the chroniclers, the first apple-trees that grew in the Massachusetts colony were planted by Governor Winthrop. It was called Governor's Island because it was a demesne for the use of the Chief Magistrate.



Castle William stood upon Castle Island, which derived its name from the fortification built upon it in the reign of King William the Third of England, at the close of the seventeenth century, by Colonel Romer, a famous engineer. He demolished all the old works that had been constructed there, and reared an entirely new structure, which was named Castle William in honor of the

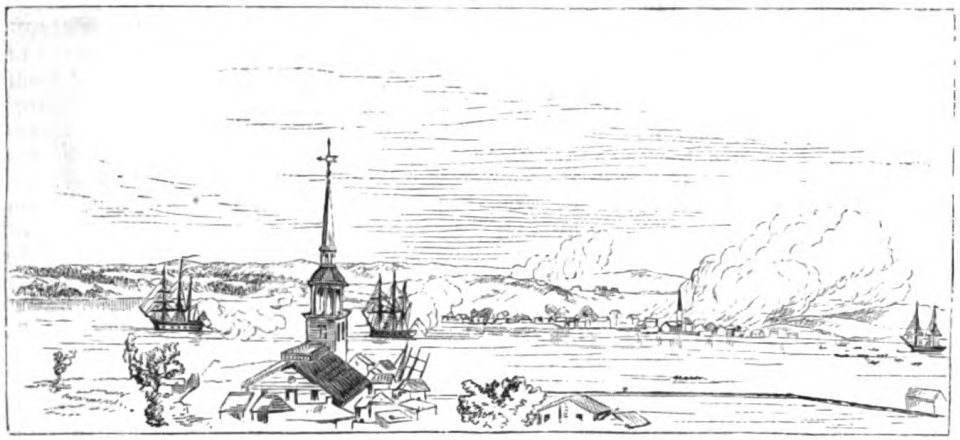
king. Before that time the fortifications were irregular works, first begun under the auspices of Governor Dudley, in the year 1634. They were partially dismantled and demolished nine years later. They were repaired the next year (1644), for England was then heaving with the throes of civil war, and it was unknown what attitude the Bostonians might be compelled to take in consequence of those convulsions. Built chiefly of wood, with brick and stone, the fort stood for thirty years guarding the entrance to Boston Harbor, when, in 1674, it was destroyed by fire. It lay partially in ruins until 1689, when it was taken by the people from Governor Andross when they heard of the expulsion of his master, James the Second, from the British throne. This was followed by the erection of Castle William, which name it retained until 1799, when John Adams, then President of the republic, on the occasion of his visit to the fortress, changed its name to Fort Independence. It is now one of the finest of the older forts belonging to our government.



Castle William and Boston Harbor have been theatres conjointly of some memorable events. The first of these in point of time was the deprivation of the castle of its national colors at the very beginning of its infancy as a mere redoubt. That stern, conscientious, and extremely pious bigot, Governor Endicott, whose hatred of Roman Catholics made the figure of the cross appear to his vision an emblem of antichrist, actually cut out the red cross from the British flag, in charge of Ensign Richard Davenport, in Salem, because it had been originally "given to the King of England by the Pope." The fort flag was also taken down because it had the cross upon it, and that guardian of the harbor was left without a token of its real character. A standing order for all vessels passing the guns of the fort to salute it with their flags was disregarded, for their masters saw no emblems of authority there, and the commander of the fort got into serious trouble by attempting to enforce the order. Officers of vessels, who treated the shorn fortification with contempt, boldly declared that the people were rebels and traitors, because they had discarded the king's colors.

The business assumed a serious aspect. Governor Vane called ship-masters before him, who frankly told him that if questioned on their return to England, their simple narrative of facts might cause the colonists a great deal of trouble. There was perplexity and alarm, and two of the ship-masters, to relieve the people, offered to present them with a set of perfect colors. But so fearful were they that they might tolerate a symbol of idolatry that they would not accept them until they could consult the Rev. Mr. Cotton, of Boston, in regard to the matter.

BOSTON, SEEN BETWEEN CASTLE WILLIAM AND GOVERNOR'S ISLAND, DISTANT FOUR MILES.

BURNING OF CHARLESTOWN.

It was finally concluded, in view of possible trouble, that while the cross in the ensign was idolatrous, and therefore ought not to be there, as the fort belonged to the king, and was maintained in his name, his colors might be used there. They were restored.

When events in the Anglo-American colonies were tending toward revolution, a little more than a hundred years ago, Castle William was a strong fortress, mounting one hundred and twenty guns, and garrisoned by a company of British artillery-men.

When public indignation waxed hot against the proceedings of the Commissioners of Customs, who came to enforce the revenue laws, it was made a refuge for those government officers. To that refuge they fled in June, 1767, before the wrath of a Boston populace. When, in September, 1768, troops came into the harbor with a British fleet from Halifax for the purpose of enforcing the impost laws, the people resolved not to allow them to land. They told them there was room enough in Castle William. The royal governor ordered the troops to disembark. The guns of the war-ships protected the movement; and on a bright Sunday morning, while the people were in their places of public worship, the soldiers marched through the streets of the New England capital with drums beating and flags flying. The inhabitants were compelled to submit to this violation of their quiet Sabbath, their religious feelings, and their rights as free citizens. From that time there was continual enmity between the citizens and the soldiers, which culminated in a mob and a massacre in March, 1770.

Until a few years before this sketch was made, Beacon Hill, one of the three which gave to the peninsula the name of Trimountain, or Tremont (seen in the middle of the picture, and looming above Boston), had retained its original height and form, for the Bostonians had determined to preserve it as a natural object in the midst of the growing town forever. But Thomas Hodson, an inveterate gravel-digger, who owned a part of the northern slope of Beacon Hill, untouched by a love of nature, foiled their designs by making broad excavations which threatened the demolition of the eminence. He would neither listen to remonstrances nor sell his land. Legislative interference was called for, but in vain. Hodson plied his shovel more vigorously as public indignation increased, until he so scarred the hill that the Boston people lost interest in it, and finally consented to have its summit dug down and cast into the neighboring waters. It dwindled to its present height, with its crown of houses, streets, and the State Capitol.

The second picture in the series here noticed is entitled "Burning of Charlestown, near Boston, New England."

This was an incident in the Battle of Bunker Hill — an erroneous name for the focus of that conflict, for the American redoubt was on Breed's Hill, and nearer Boston, and the British fought on the slopes of the latter eminence. But the event has its title in history consecrated by long and common usage, and it will be forever known as the "Battle of Bunker Hill." It was fought on the 17th of June, 1775, almost exactly ninety-eight years ago.

The closing of the port of Boston in June, 1774, awakened for the suffering town the warmest sympathies of the Anglo-American colonies. Expressions of that sympathy and substantial aid were given by the various provinces. The people of Marblehead and Salem offered the free use of their wharves to the Boston merchants. Articles of food of almost every kind were sent to the doomed city; and the corporate authorities of London pointedly rebuked those cruel oppressions by the government by sending the sum of $100,000 for the relief of the suffering poor of Boston.

Gage was warned that a relaxation of

vigor must be made, or armed resistance would be the resulting alternative; but, bound by his instructions, he used force instead of conciliation for the maintenance of public order. Finally, when he stationed a strong military guard upon Boston Neck, under a false pretense, and so cut off free intercourse between the city and country, the lightning of rebellion, which had for years been curbed within the hearts of the people, leaped forth in manifestations which alarmed the royal servants in Massachusetts, and startled into serious reflections the hirelings of the crown elsewhere on the continent. The people of that province began to arm themselves and practice military tactics daily. The organization known as "Minute-Men" was formed; and the Legislature of Massachusetts, in session at Salem, sent forth a proposition for a general Continental Congress to assemble in Philadelphia in the ensuing September. The proclamations of General Gage, condemnatory of these rebellious movements, were not only unheeded, but ridiculed in squibs and epigrams. One of these, now before me, begins:

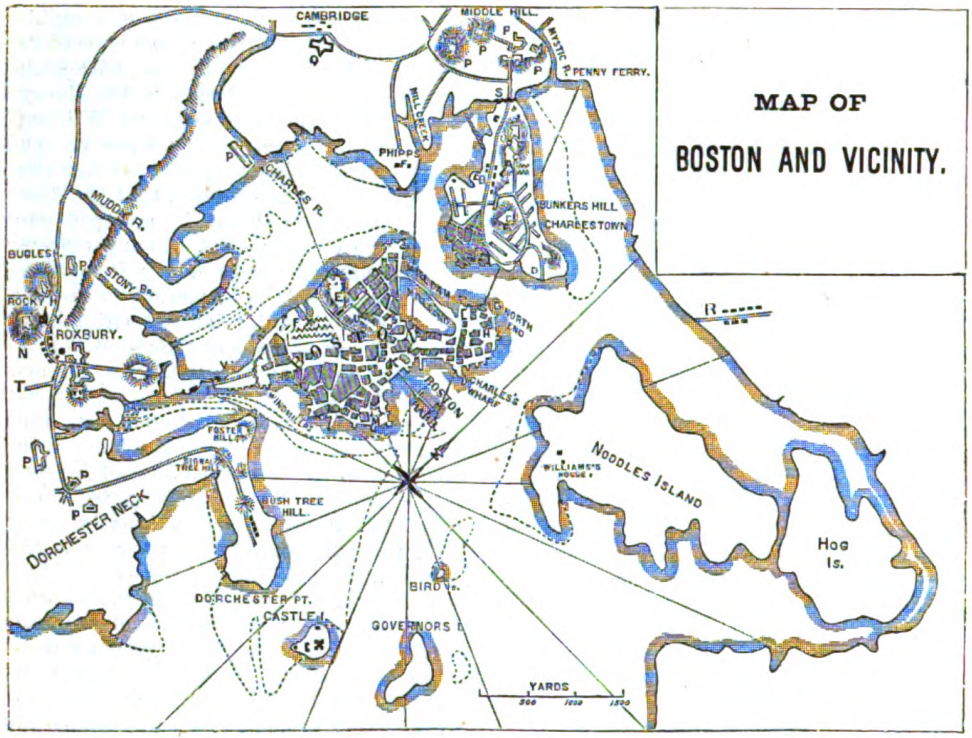
"Tom Gage's Proclamation,
Or blustering Denunciation
(Replete with Defamation),
Threatening Devastation
And speedy Jugulation
Of the New England Nation,
Who shall his pious ways shun."

It closed with,

"Thus graciously the war I wage,
As witneseth my hand—
"TOM GAGE.

"By command of Mother Carey,
THOMAS FLUCKER, *Secretary*."

Mr. Flucker was the father of the beautiful and accomplished Lucy, who became the wife of General Henry Knox, then a young bookseller in Boston.



The Continental Congress met at the beginning of the autumn, and took a decided attitude of opposition to the conduct of the government toward the colonies. During the following winter the people prepared for war; and when, in the spring of 1775, Gage sent out troops to seize ammunition and stores which the patriots had collected a few miles from Boston, the people flew to arms, and the skirmishes at Lexington and Concord occurred. The news of the bloodshed there aroused the continent. New York was in a blaze of excitement; and from the Virginia Convention at Richmond went forth the impassioned and significant cry from Patrick Henry, "Give me liberty, or give me death!" The British troops had been driven back to Boston in a pell-mell scamper for life by the yeomanry of the neighborhood, and the Americans had learned the important lesson that the soldiers of Great Britain were not absolutely invincible.

The events of that memorable 19th of April closed the first act in the drama of the struggle for independence. The plot now rapidly developed. Fresh troops soon arrived in Boston from England and Ireland, with such experienced leaders as Generals Sir Henry Clinton, Sir John Burgoyne, and William Howe, and increased Gage's force to ten thousand men. They prepared to crush the rebellion, and it was declared that the fires of the insurrection should be stamped out in the space of six weeks. Young officers brought fishing-tackle, to indulge in angling in the waters of subdued America, while others came with the intention of settling here on the confiscated lands of the rebels.

But there was another party to the arrangement. It consisted of several thousand provincial troops, gathered from the hills and valleys of New England, who formed an irregular curved line of investment, extending from Roxbury to Cambridge. Their captain-general was Artemas Ward; their lieutenant-general was John Thomas, and their engineer-in-chief was Richard Gridley. All New England was there represented; and such veterans as Putnam, Stark, Pomeroy, and Prescott, who had been educated in the French and Indian war, with Ward and Gridley, were there to lead the eager yeomanry. A Committee of Safety wielded the civil power, and there was perfect concord of sentiment in the council and in the field. When, at the middle of June, it was ascertained that General Gage had fixed upon the night of the 18th of that month to take possession of and fortify Bunker Hill and Dorchester Heights, the patriot army numbered about twenty thousand men.

To prevent the execution of Gage's design was now the business of the Americans. A portion of three regiments and a fatigue party of two hundred Connecticut troops, with intrenching tools, paraded in the camp at Cambridge at six o'clock in the evening of the 16th of June. They were furnished for a campaign of twenty-four hours. Gridley's company of artillery joined them. The Connecticut troops were placed under the command of Captain Knowlton, of Putnam's regiment, who was killed in the battle on Harlem Plains the next year. President Langdon, of Harvard College, commended the party to the protection of the Almighty in an impressive prayer, and at nine o'clock the whole force, led by Colonel Prescott, marched in silence to Charlestown Neck, where the troops were first apprised of the object of their expedition. It was to possess and fortify Bunker Hill. There they were joined by General Putnam and one or two other officers. Strict silence was enjoined. A council of officers determined to fortify Breed's Hill—less in height, but nearer Boston than Bunker—instead of the latter. To that elevation, about sixty feet

above tide-water, they went, and during the warm starry night, while the voices from British sentinels on ships, and at the foot of Copp's Hill, in Boston, were proclaiming "All's well!" they worked vigorously.

At the dawn a formidable redoubt, eight rods square, loomed up near the green summit of Breed's Hill, at the spot where the stately Bunker Hill Monument now stands. It appeared to the wondering gaze of the British officers in the dim morning twilight like a work of magic. The history of British engineering furnished no parallel, and the testimony of British eyes was doubted.

A sentinel on board the *Lively* first saw the apparition. The captain put springs upon his cable, and opened a cannonade upon the redoubt, without doing it any injury. His guns awoke the sleepers in Boston, and at sunrise Beacon Hill, Copp's Hill, and the roofs of houses swarmed with the startled inhabitants. The men in the redoubt, sheltered by its ramparts, continued the task of strengthening the work, until called to lay aside the pick and shovel and take up the gun and knapsack. The firing had ceased for a short time, but was soon renewed, not only by the shipping, but from a battery of six guns upon Copp's Hill, in the city.

All was now bustle and excitement in Boston. The drums beat to arms, dragoons galloped through the streets, artillery trains rumbled over the pavements, and regulars and Tories were marching and countermarching. A panic seized the loyalists in the presence of impending danger, and many were converted into professed patriots.

Observing the movements of the British, Prescott, at ten o'clock, sent to Cambridge for reinforcements, when Ward forwarded the remainder of Stark's regiment and the whole of Reed's, all from New Hampshire. At noon the men in the redoubt ceased work, and sent their intrenching tools to Bunker Hill, where, under the direction of Putnam, a breastwork was thrown up.

Meanwhile between two and three thousand picked men from the British army embarked in barges at Boston and landed on Morton's Point, beyond the eastern foot of Breed's Hill. They were commanded by Generals Howe and Pigot, and were covered by the guns of the *Falcon*, which lay in the Mystic River. The news of this movement had reached Cambridge, and produced great commotion there. The drums beat to arms, and the bells rang out an alarm. The remainder of the Massachusetts forces were ordered to Charlestown, and thither Putnam conducted those of Connecticut.

It was now two o'clock in the afternoon. Howe had been reinforced, and was at the head of about four thousand men. There was the deepest anxiety on Breed's Hill. The patriots there, hungry and thirsty, had watched the whole martial display prepared for their destruction. They had not been largely reinforced, and were half despondingly, when Dr. Joseph Warren and General

Pomeroy, covered with dust, arrived at the redoubt. They were greeted by loud huzzas. The former was the President of the Massachusetts Provincial Congress, then sitting at Watertown. He had been commissioned a major-general four days before. When he heard of the landing of the British he left his seat, and, though suffering from sickness, hastened forward to confront the enemy in arms. Prescott offered to give up the command to him, as his superior in rank, when Warren said, "I am come to fight as a volunteer, and feel honored in being allowed to serve under so brave an officer."

At the moment when Warren entered the redoubt, Howe began his advance, marching around the eastern slopes of Breed's Hill and along the Mystic River, to flank and gain the rear of the Americans. Already, anticipating this movement, the artillery-men in the redoubt, with two field-pieces, and Captain Knowlton with the Connecticut troops, had taken a position near Bunker Hill, and formed a breastwork seven hundred feet in length. Knowlton built another a little in front of a strong stone and rail fence, and between the two was planted a quantity of new-mown grass. This formed a valuable protection to the Americans.

It was now three o'clock in the afternoon. The American artillery companies were between the breastwork at the east of the redoubt and the rail-fence on the eastern side of the hill; and the Connecticut and New Hampshire troops were at a rail-fence on the western side of the redoubt. Others were close by Charlestown, at the foot of the southwestern side of Breed's Hill. Warren took post with Prescott within the redoubt, where the original builders of that work were put on the defensive.

Howe was checked in his flank movement, and compelled to make a direct attack upon the American works. Before doing so he ordered the guns on Copp's Hill and the ships in the river to pour a storm of round shot upon the redoubt. At the same moment a furious cannonade was opened upon the right wing of the American army at Roxbury, to prevent reinforcements being sent to Charlestown by General Thomas.

Under cover of these discharges of artillery, the British army moved up the slopes of Breed's Hill in two divisions, General Howe with the right wing, and General Pigot with the left. The former was to penetrate the American lines at the rail-fence; the latter was to storm the redoubt. Owing to a blunder in furnishing the artillery, small-arms and bayonets became the only weapons of the British soldiery, who toiled silently up the hill, in the bright sun of a hot June day, burdened with heavy knapsacks. More silent were the inmates of the redoubt. To the outside observer there was no sign of life; but within those breastworks, and in reserve behind the hills, were fifteen hundred resolute men, ready at a given signal to fall upon the invaders. "When you can see the whites of their eyes, then aim at their waistbands and fire: be sure to pick off the commanders, who may be known by their handsome coats," were Prescott's orders.

When they were within gunshot of the apparently deserted works, the British commenced a random firing. Prescott could scarcely keep his men from responding in kind. At length the assailants reached the prescribed distance, when Prescott, waving his sword over his head, shouted, "Fire!" Terrible was the effect of the first volley. Whole platoons of the British regulars were laid upon the earth like mown grass. Other deadly volleys followed, and the assailants broke and fled toward their boats. The Fifth regiment, in which the young Lord Rawdon was serving as captain, was terribly cut up in this and the succeeding attacks.

Howe quickly rallied his troops. Putnam rode to Bunker Hill to urge on reinforcements. Others were sent from Cambridge. Many of the latter had reached Charlestown Neck, but were kept from crossing it by the severe enfilading fire of the *Glasgow* (a ship which brought troops to Boston in 1768), and gondolas in the Charles River, the latter near a causeway. But few additional troops had been brought to Breed's Hill when the second attack was made.

Four hundred marines from Boston had reinforced the British troops. Their artillery was now better furnished. In the same order as at first they moved up toward the redoubt over the slain bodies of scores of their fellow-soldiers, led by General Howe in person. Their artillery opened a galling fire upon the troops at the rail-fences. Meanwhile Howe led his column directly toward the redoubt. As before, the Americans reserved their fire until the invaders were within the prescribed distance, when they poured forth their leaden hail with such terrible effect that whole ranks of officers and men were slain.

Meanwhile a carcass and some hot shot hurled from Copp's Hill had set fire to Charlestown. The houses, built chiefly of wood, were soon in flames, to the number of about two hundred. Breed's Hill was shrouded in dense smoke, and under its thick veil Howe hoped to rush up unseen and storm the redoubt. But a gentle breeze, the first that had been felt that day, came from the west, and rolled the smoke away seaward, exposing to the full view of the Americans the advancing column of the British. Their line recoiled before the volleys from the redoubt. At one time General Howe was left alone, all of his aids having perished in the fight. His troops broke and

BUNKER HILL AFTER THE BATTLE.

fled at several points, and retreated in disorder to the shore.

Sir Henry Clinton, who, with Burgoyne, had been watching the battle from Copp's Hill, saw with mortified pride the regulars repulsed a second time. He crossed over in a boat, followed by others with reinforcements, and joined the broken army as a volunteer. This was the moment chosen by the artist for making the sketch of the "Burning of Charlestown." The smoke is seen borne eastward by the gentle breeze.

Howe now rallied his troops for a third attack. The powder and ball of the provincials were now nearly exhausted, and as only a few of their muskets had bayonets, they were in a perilous condition. The loose stones in the redoubt were collected to use as missiles, if necessary.

Howe had discovered the weakness of the point between the breastwork and the rail-fence on the east of the redoubt, and there he made his third attack. His artillery swept the interior of the breastwork from end to end with fearful effect; and the men who defended it were driven within the redoubt, toward which the assailants now pressed. There was the same ominous silence, but now it was compulsory. The last grain of the powder of the patriots had been consumed. The redoubt was scaled. Hand to hand the belligerents fought—the British with bayonets, the Americans with clubbed muskets. So overwhelming were the numbers of the assailants that Prescott ordered a retreat. He and Warren were the last to leave the works. The former escaped without injury, but the latter, when he was a short distance from the redoubt, was shot through the head with a bullet, and fell dead. A panic was communicated to the rest of the troops, who fled across Charlestown Neck, where many of them were slain by the enfilading shots of the *Glasgow* and gondolas. The British did not follow, but contented themselves with the possession of the Charlestown peninsula. The accompanying map will make this brief narrative of the battle clearer.

The picture of the "Burning of Charlestown" was evidently made from Beacon Hill; and the church roof and steeple seen in the foreground were probably those of the West Church edifice. It was built of wood, and had a tall steeple, which was removed by the British in 1775, because, it is said, the patriots in the city made use of it for signaling to their friends at Cambridge information concerning the military movements in Boston. Other church steeples were used for the same purpose. Paul Revere has left a statement on record that on returning from Lexington, whither he had been to see Hancock and Adams, just before the skirmish there, he agreed with gentlemen at Charlestown that if the British went out from Boston by water, he would show *two* lanterns in the North Church steeple, and if by land, *one*.

On the right of this picture is seen the mill-dam, which held the waters of the tide-mill pond or cove, which was divided from the sea on the northwest by a causeway (now Causeway Street), which had been a foot-path of the Indians over a more elevated part of a marsh. It was raised and widened into a dam, and several tide-mills were constructed for using the pond so formed. In 1807 the work of filling it up was begun, and continued for about twenty-five years. Copp's and Beacon hills furnished the materials.

On the extreme right of the picture is seen the *Falcon*, and a little to the left of her the boats with reinforcements following Sir Henry Clinton to Morton's Point. Im-

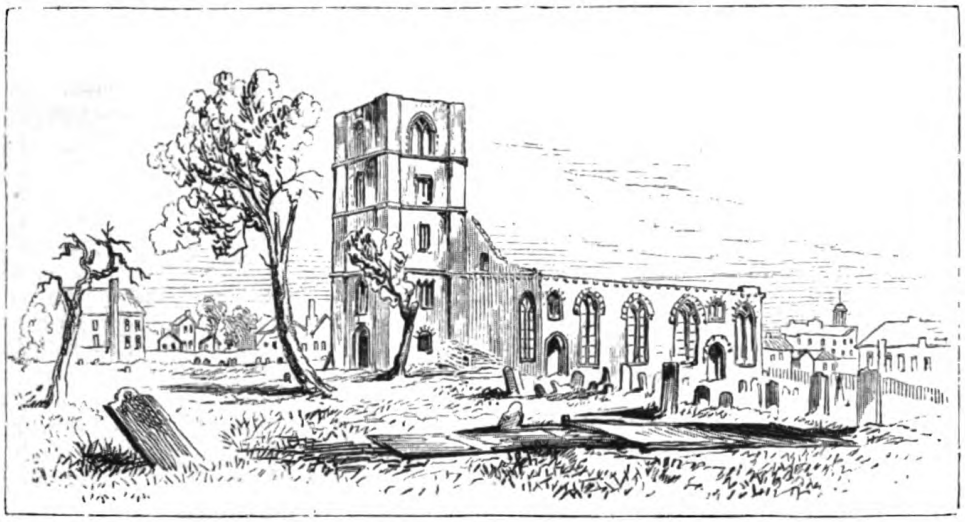
mediately back of Charlestown on fire is Breed's Hill, and the higher eminence to the left is Bunker Hill. Near the centre of the picture and the steeple is seen the *Somerset*, one of the vessels engaged in the fight; and toward the extreme left is the *Glasgow*, with the gondolas. Immediately back of the steeple, and projecting each side of it in the picture, is Charlestown Neck, and on the extreme left, Cambridge.

The third picture in the series is a view of "Bunker [Breed's] Hill after the Battle," taken, apparently, from the shore of the Mystic River, and showing the shape and position of the redoubt and the ruins of the fences near it.



We are now led, by the fourth picture of the series, to the city of New York. In this drawing we have a distant view of that city, entitled, "New York, with the Entrance of the North [Hudson] and East Rivers." This sketch was doubtless made in the summer or early autumn of 1776. The British troops, under General Howe, had been driven from Boston in March of that year, and retired to Halifax. In the summer they sailed southward, and took possession, first of Staten Island, at the entrance to New York Harbor, and then the western end of Long Island (seen on the right of the picture); and finally, early in September, they captured Manhattan Island, with the city of New York. In these events Lord Rawdon participated as an active subaltern under Cornwallis. The picture must have been sketched before the 21st of September, when Trinity Church was burned, for the spire of that edifice is seen in the sketch—the one farthest to the left in the city. The spire next to the right of Trinity's was that of the "South Dutch," or Garden Street Church; the next was of the "Middle Dutch" (now the Post-office); the next and taller was of St. Paul's; and the one on the extreme right was of the "North Dutch," which has been demolished recently.

This picture appears to have been made from a vessel in the harbor a little below Governor's Island, which is seen at the right of the city, with the entrance to and shipping in the East River, seen between. It may have been drawn on board the *Eagle*, one of Admiral Richard, Earl Howe's fleet, which sailed up the bay at the close of August, 1776, and anchored near Governor's Island. That vessel lay at about the place from which the sketch was evidently made, and came very near becoming the victim of a torpedo—an "infernal machine"—called a "marine turtle," invented by a mechanic of Saybrook, Connecticut. It was constructed so as to contain a living man, and to be navigated at will under water. A small magazine of gunpowder, so arranged as to be secured to a ship's bottom, could be carried with it. This magazine was furnished with

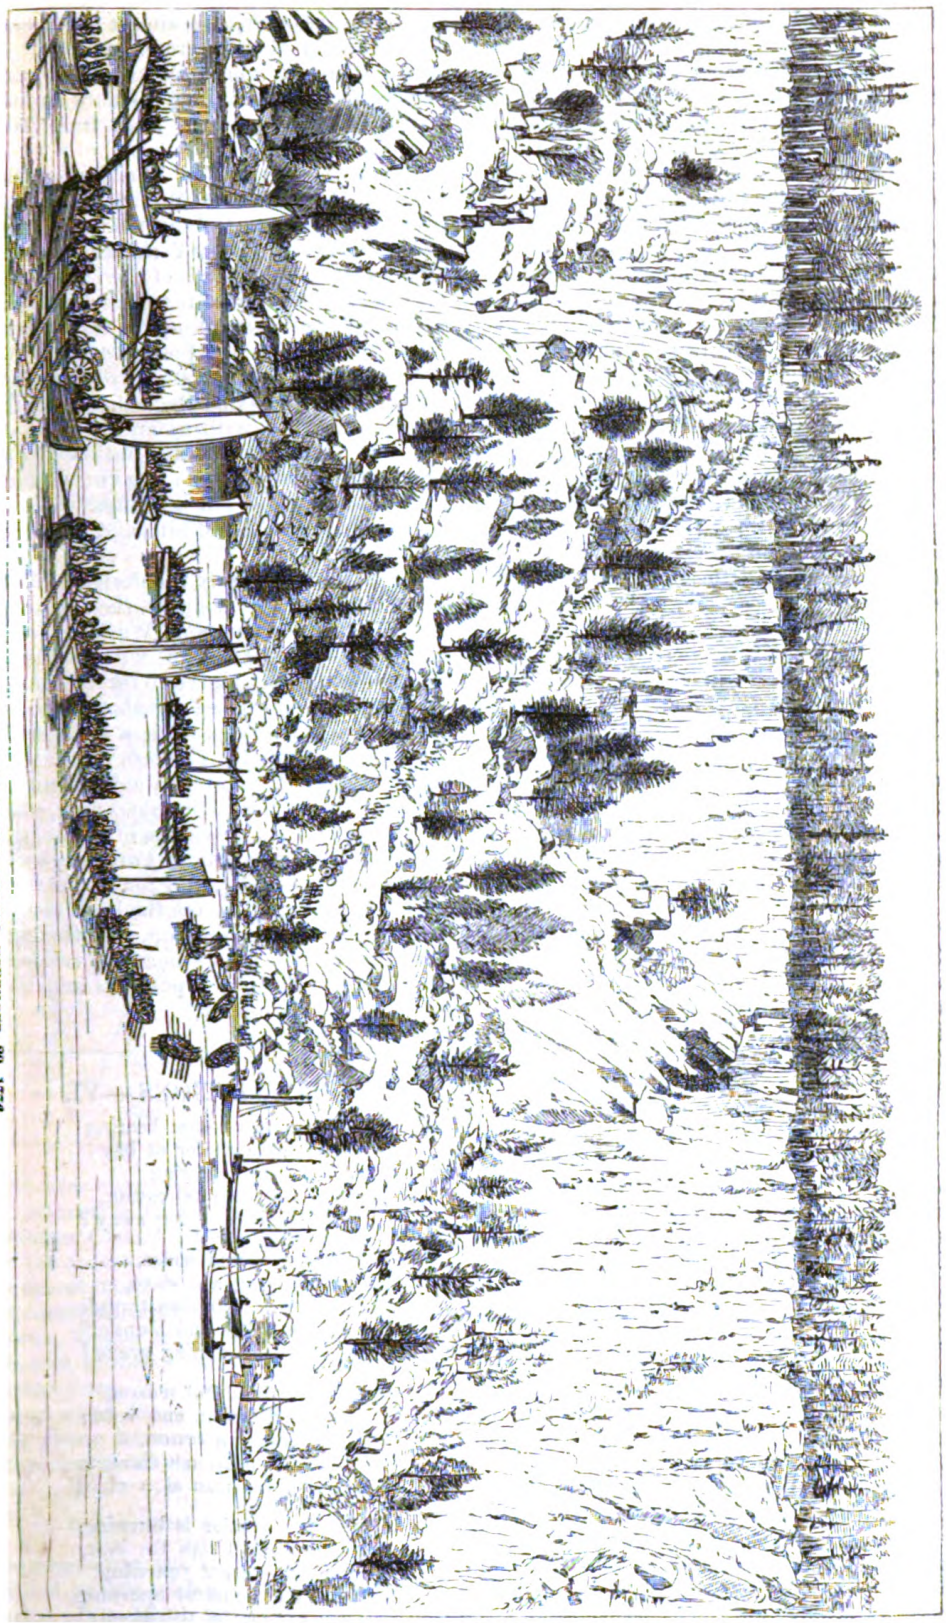
THE ENGLISH CHURCH BUILT AT NEW YORK.

clock-work, constructed so as to operate a spring and communicate a blow to detonating powder, and so ignite the gunpowder of the magazine. The motion of the clock-work was sufficiently slow to allow the submarine operator to escape to a safe distance after securing the magazine to a ship's bottom.

With this machine it was proposed to blow up the *Eagle*. A daring young man named Lee was employed to do the work. He entered the water at Whitehall at midnight on the 6th of September. Washington and a few other officers watched anxiously until dawn for the result, but the calm waters of the bay remained unruffled, and it was believed that the young man had perished. As the chief and his companions were turning from the scene some barges went out from Governor's Island toward an object near the *Eagle*, and suddenly returned with increased speed. In a few moments a column of water ascended a few yards from the *Eagle*. The cables of the British shipping were instantly cut, and the fleet went down the bay with the ebbing tide in great confusion. Lee had been under the *Eagle* and other ships, but found their copper sheathing too thick to allow him to fasten his magazine to a bottom. He set the clock-work in motion and escaped to Whitehall.



On the right of the picture, beyond the vessel, Brooklyn Heights and other high ground in the vicinity are seen; and on the left of the city is the entrance to the North or Hudson River, with the Palisades and other portions of its western shore in the distance between the two vessels. On the extreme left are Ellis's and Bedloe's islands.

I have mentioned the burning of Trinity Church, in New York, in September, 1776. The fifth picture of the series gives us a view of its ruins, under the title of "The English Church built at New York." The sketch was made from the church-yard, a short distance from the southwest corner of the edifice, whose tower and steeple were on the west end, fronting the Hudson River,

which then had its shore at Greenwich Street. Between the church and the river was the burial-ground and a green lawn. The buildings seen beyond the ruins of the church were along the east side of Broadway. The short steeple in the distance, on the right, was that of the "Middle Dutch" Church, now used as a city post-office. That steeple was taken down last year.

The fire that consumed the church accidentally broke out in a low groggery and brothel, a wooden building on the wharf near Whitehall Slip, now the Staten Island Ferry station. It was discovered between one and two o'clock in the morning of the 21st of September, 1776. There were then only a few inhabitants in the city, and the flames, unchecked, spread rapidly. All the houses between Whitehall and Broad streets up to Beaver Street were consumed, when the wind veered to the southeast, and drove the fire toward Broadway. It burned every thing on each side of Beaver Street to the Bowling Green, a little above which it crossed Broadway, and swept all the buildings on each side as far as Exchange Street. On the west side it consumed every building from Morris Street to Partition (now Fulton) Street, and threatened new St. Paul's Church. It destroyed Trinity Church, leaving nothing but the tower and the walls standing, and made a clean sweep to the river; and it extended west of King's (now Columbia) College, to Murray Street. In its entire course 493 of the 4000 buildings then in the city were consumed.

The sixth picture of the series is entitled, "Careening Place, New York, above Colonel Rutgers's, East River." It is interesting as showing the form of English war ships at that time, the method of preparing them for the examination and repairing of their bottoms by careening them on their beam ends, instead of by the modern contrivance of "dry-docks," and the contour of the hills across the East River, on which Williamsburg, or East Brooklyn, now rests. It is possible, and even probable, that this is an actual view of the repairing of the forty-gun ship which Admiral Howe sent up the East River on the night after the battle on Long Island, which was damaged by round shot from a battery on Burnt Mill, or Stuyvesant Point, the site of the Novelty Iron-Works.

The "Careening Place" was at Corlear's Hook, now the vicinity of the foot of Grand Street. Colonel Rutgers's mansion was on ground now bounded by Monroe, Cherry, Jefferson, and Clinton streets.

The last picture of the series to be noticed is entitled "Landing of the British Forces in the Jerseys on the 20th of November, 1776, under the Command of Right Hon. Lieutenant-General Earl Cornwallis." The story may be briefly told. The scene is at the Palisades, a ridge of trap-rocks extending along the western shore of the Hudson River from near Haverstraw almost to Hoboken, a distance of about thirty-five miles. Between Piermont and Hoboken these rocks present for a considerable distance an uninterrupted rude columnar front from 300 to 500 feet in height.

This is the story: Fort Washington, situated on the crown of Mount Washington (now Washington Heights), in the upper part of the city of New York, was captured by the British on the 18th of November, 1776. Fort Lee, on the top of the Palisades, nearly opposite Fort Washington, was then the rallying point of a greater portion of the Continental army, which had fled across the Hudson into New Jersey on the 12th. From that fort, Washington, with several general officers, and Thomas Paine, the author of *Common Sense*, saw the British flag unfurled over Fort Washington. For a moment the great heart of the chief failed him, and tears filled his eyes.

It was now evidently the design of Howe to push toward Philadelphia, the seat of the "rebel" government, and Washington resolved to fly to its defense with his diminishing army, then reduced to three thousand effective men. Fort Lee was abandoned, and the Continental troops made a swift march across New Jersey for Trenton, on the Delaware. Cornwallis crossed the Hudson from Dobb's Ferry with six thousand men, scaled the Palisades, took possession of the baggage and military stores left at Fort Lee by the fugitive Continentals, and for three weeks chased Washington across the level country from Hackensack to Trenton. At the latter place the pursued, strengthened by reinforcements, turned upon their pursuers and drove them out of New Jersey.

IMPROVISATIONS.—VI.

HEART, in my bosom beating
Fierce, as a power at bay!
Ever thy rote repeating
Louder, and then retreating,
Who shall thy being sway?

Over my will and under,
Equally king and slave,
Sometimes I hear thee thunder,
Sometimes falter and blunder
Close to the waiting grave!

Oft, in the beautiful season,
Restless thou art, and wild;
Oft, with never a reason,
Turnest and doest me treason,
Treating the man as a child!

Cold, when passion is burning,
Quick, when I sigh for rest,
Kindler of perished yearning,
Curb and government spurning,
Thou art lord of the breast!

BAYARD TAYLOR.

THE WINE ISLANDS OF LAKE ERIE.

"And glitters o'er the liquid miles
The jeweled ring of verdant isles,
Where generous Nature holds her court
Of ripened bloom and sunny smiles."

—JOHN HAY.

GATHERING THE GRAPES.

TO the imagination there is something attractive in the very name of island. Robinson Crusoe on the main-land would lose the crown of his glory; it is the island, the island, that fills the boyish heart with wondering interest. For children of a larger growth Reade takes up the tale, and his hero and heroine—but ordinary mortals in London—are invested with a strange romance when thrown together upon an island; young love reads, young love dreams, and young love wishes,

"for thee and me,
A lone sweet isle amid the sea."

The representative Lady, type of the many isolated hearts who give their love to some unattainable ideal, lived upon an island; the Master whose exquisite words are like chords of music placed her, knowing what he did,

"where the lilies blow
Round an island there below,
The island of Shalott."

"Isles of the blest!" sighed the ancients, as they looked out over the unknown ocean, seeing in the hazy clouds of the horizon the purple shores of everlasting rest. And who among us, when traveling sad and weary over the waters, has not fallen into silence at the sight of far blue islands, mingling the Psalmist's wish, "O that I had wings like a dove! for then would I fly away and be at rest," with dreams of the star islands in the sea of infinite space, whither we may be going after death, and where our loved ones may even now be awaiting us.

Erie is a dull lake, like persons one meets in life, neither beautiful nor ugly, neither strong nor weak, neither good nor bad. Its name signifies cat, given, say the first explorers, on account of the number of wild-cats upon its borders; and as if this was not evil enough, the antiquated geography of Jedediah Morse, first published in 1789, describes the western end of the lake and its islands as so infested with rattlesnakes as to render it dangerous to land, acres of these creatures having been seen basking on the

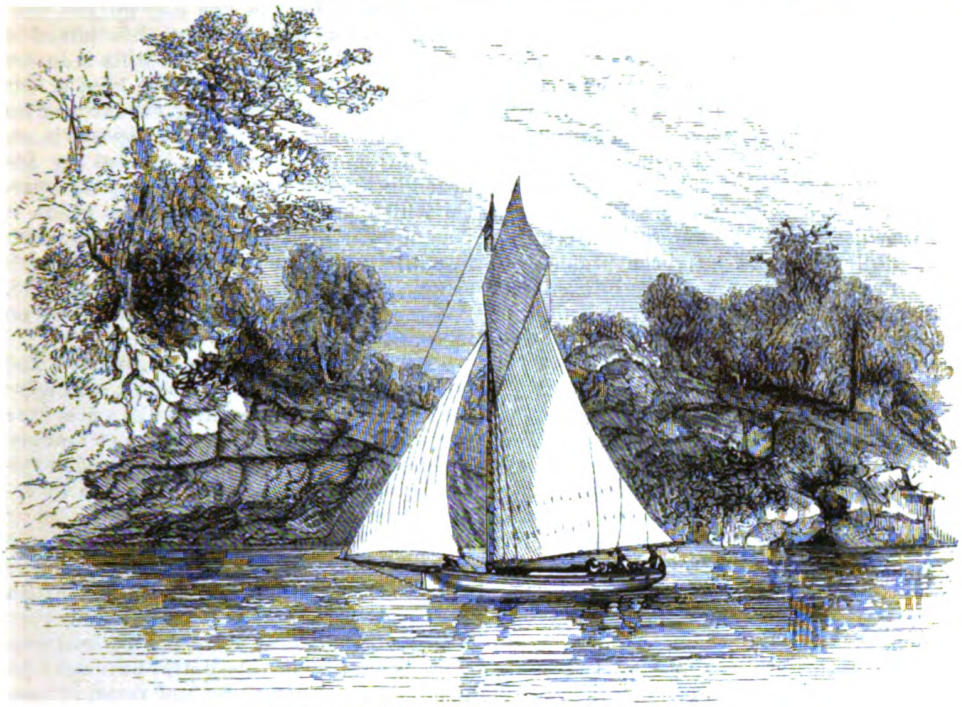
MEMORIAL TO COMMODORE PERRY, GIBRALTAR ISLAND.



lily leaves which stretched in every direction over the shallow water. At the present day the cats and rattlesnakes—unless, indeed, we except Reade's and Holmes's personifications of them—are gone; but the dullness remains, and we may sail from Buffalo to Cleveland, and from Cleveland to Detroit, we may cross and follow the Canada shore back again, and in all the 600 miles see nothing worth seeing save the man-made towns, so that we almost wish the eighteen thousand years which the Boston savants have assigned for the lake's evaporation might dwindle to eighteen, and thus let the Ohio corn fields spread their green ranks across to the Dominion shore. For from end to end there is no beauty in it. A Scotchman was once rallied about the total want of beauty in his betrothed. "Eh, lads," he answered, "dinna ye ken the dimple in her elbow?" And in like manner homely Erie has a dimple in her elbow, the group of islands in her southwest corner, as indistinct in the minds of most salt-water Americans as the Atlantis of the ancients. These islands, ten or more in number, varying in size from 2800 acres to a mere dot in the water, lie off Sandusky Bay, stretching out into the lake to meet their five Canadian sisters and the long point of Pelée. The large steamers on their way up and down the lakes pass north of these islands, and generally make the passage in the night, and thus in order to see them one must go to Sandusky, and sail out over its bay in one of the little steamers belonging to the island fleet—for these islanders are a maritime people, and own a small flotilla of all kinds of craft, from a steamer to a sloop for a one-man crew. Fishing boats, too, they have, in which they sail out to their fish-pounds, and come racing home wing-and-wing, loaded down with live fish crowded into their boat tanks. Then comes a lively scene, as the slippery creatures are thrown up into boxes standing on the dock, and so deftly is this managed that although tossed up with scarcely a glance, each squirming fish goes safely into his box, and is there transported into the interior, to be eaten by the farmers and their families; for here, as every where else, imported luxuries are preferred; the fish of the islands go into the interior, and the flesh of the interior goes out to the islands. The fish-pounds are numerous, and at night, when, as the law requires, they are all lighted up, the water looks as though a fairy fleet was sailing over it, so low down and so bright twinkle the little lights. Indeed, to a steady-going main-lander who does nothing by chance, the island fishery is but witching work at best. He has, perhaps, spent St. Martin's summer among the vineyards, eating the grapes and drinking the fresh juice from the presses, which, as the old English verse says,

"Saint Martin afterward
Alloweth to be wine—"

a most fortunate miracle for the health of the incautious drinker. But now he sees a cloud rising behind the purple mist; the Indian summer is over, and thoughts of the home fireside send him on board of the little steamer, which presently sails away, as he supposes, for Sandusky and the railroad. Mistaken supposition! The little boat circles round in the archipelago, now going one way and now another, now slowing, now hastening on, now turning her head inshore, and then suddenly backing out without stopping, until the bewildered traveler wonders whether a will-o'-the-wisp is at the bow. At length the charm is pointed out; it proves to be nothing more or less than a white rag. This sign, hung out on the end of a pole, means "fish," and as the catch is variable, and the stations numerous, the erratic course of the boat is explained.

It is within the memory of the generation now passing away that the Lake Erie islands came into the jurisdiction of civilization by means of a United States survey. Before that period their exact situation and size were unknown, and their few inhabitants were wild lords of the isles, beyond the reach of the law, who came occasionally to the main-land settlements to traffic away their rafts of cedar logs, but who lived generally by hunting and fishing, with just a suspicion of a taste for wrecking when the September gales threw a harvest along their shores. But when the Kelley family regularly purchased the island since called by their name, the largest of the American group, the day of squatter sovereignty was over, and the hybrid population, with its mud floors and

SHORES OF PUT-IN-BAY.—THE LAKE ERIE YACHT.

no windows, slowly gave place to settlers of a better class—slowly, since even now some of the islets are uninhabited, several have only a solitary family, and one, of course, has the traditional hermit who will not allow a woman's foot to touch the sacred soil of his retreat. The Indian names of the islands are gone, and they now bear the haphazard titles given to them by the sailors and settlers along shore: "Ballast," "Gibraltar," "Sugar," "Rattlesnake and the Rattles," "Green," "The Three Sisters," "The Three Bass," "Old Hen and Chickens," "Mouse," "Starve," "Pelée," and "Kelley's," the last formerly known as "Cunningham's."

The group has its page in history, a page which might well cause envy in the rich main-land cities cherishing a taste for historical societies, and burning for heroes to honor. Upon this page men well known in American annals appear, for the little archipelago has witnessed skirmishes and battles, plots and victories, in the past and in the present, for present still seems the war of the rebellion, although when we reckon them, nearly a decade of years has passed since its close.

First come the Indians. The story of the red men since the coming of Columbus is but a dreary series of wars and rumors of wars, broken truces, migrations, and never-ending trouble. Every plan has been tried, from gifts to rifle-balls, and every religious denomination has had an opportunity to try its moral suasion, while the impatient frontier soldiers and pioneers, who look upon Indians as so many wolves, have been held back by the strong arm of the law from the work of extermination. And what has been accomplished? Nothing. The few feeble successes gained at the expense of precious lives and heavy contributions of money can not color the mass any more than one drop can color a fountain. The Indian question has become a weariness to the nation, and there is a universal skipping whenever the popular heading of "Lo" appears in the newspaper column. With the universal habit of mortals, however, we cherish an interest in what is beyond our reach. Let an Indian tribe vanish entirely from the earth without leaving a shadow behind, not even one chieftain to go as a deputation to Washington, not even one brave who refuses to live upon his reservation, and skulks around the settlements clad in the cast-off silk hats of the white man, and forthwith we begin to exalt the extinct race with the heart of an antiquarian and the pen of a novelist. It is only the degenerate, mind-fatiguing Indians of to-day whom we despise; no doubt the tribes of the past were of a nobler nature. Among these tribes of the past there are none more completely past than the Eries, who have left scarcely more than a name behind them. They belonged to that remarkable confederacy of tribes called the Neutral Nation, dwelling upon the southern shore of Lake Erie, a city of refuge for warring parties on either side. To them belonged the right of lighting the council-fire of peace, a ceremony which was said to require a maiden hand, and for

years they held their place, respected and at peace. Upon these western islands were some of their fastnesses; traces of their fortifications were discovered there by the first surveyors, earth-works built, apparently to inclose a village, with gates and sally-ports of wood, and in one place a quantity of new stone axes and arrow-heads stored away in a rude armory for future use. Picture-writing was also found, and one rock inscription upon Kelley's Island has been pronounced "the most extensive well-sculptured and well-preserved inscription ever found in America." The Eries were at the head of the Neutral Nation, and at the time of the first French explorers they were in the height of their power. So much is known, but no more. The Iroquois came and swept them from the face of the earth. "Of course," says the student of lake-country history, wearily. "The Iroquois are as sure to come sweeping in at the last as Sir William Johnson!" The Eries were so utterly destroyed that the most patient investigator can only say, "They were, and they are not." "Little besides their existence is known of them," says Parkman, whose histories are as reliable as they are fascinating—an unusual combination. It is an evil, no doubt, to be unreliable, but oh, is it not equally evil to be a Dry-as-dust?

A century and a half passed, during which the history of the lake islands is involved in obscurity, and then upon the scene steps Tecumseh, who belongs to Ohio and Lake Erie, as Pontiac belongs to the lovely Detroit River. The chieftain is near his end when we see him; he is making his last speech on the shore of the lake near the islands where he has watched the smoke of the battle at Put-in-Bay, and although he suspects the defeat of his allies, he scorns to retreat, and covers the British general with Indian satire. Standing upon the beach, and waving his hand toward the islands, in the name of all the tribes he speaks: "Father, listen! Our fleet has gone out; we know they have fought, we have heard the great guns, but we know not what has happened to our father with one arm" (alluding to Commodore Barclay, Perry's antagonist, who had lost an arm at Trafalgar). "Our ships have gone one way, and we are much astonished to see our father tying up every thing and preparing to run the other! You always told us you would never draw your foot off British ground, but now we see you drawing back without even a sight of the enemy, and we must compare our father's conduct to a fat dog who, when he is frightened, drops his tail and runs away! Father, listen! The Americans have not yet defeated us by land, and whether or not they have defeated us by water, we still wish to remain here and fight when they appear. You have the arms and ammunition which our great English father sent to his red children; give them to us, and you may go, and welcome. But as for us, we are determined to stay, and, if the Great Spirit wills it so, we will leave our bones upon the land of our forefathers." For scathing rebuke and inflexible courage this red man's speech is admirable; and it was emphasized by his death in the first battle that ensued—a battle which he knew was hopeless before it began, but which his single determination absolutely held in the balance until death struck him down. As the historian says, "When his well-known voice was heard no more, the battle ceased."

The shade of the Indian has passed, and now enters the young commodore, who, upon the wild shores of Lake Erie, built a fleet from the trees of the forest, and almost nothing besides—a feat which in the mind of a modern ship-builder surpasses even the subsequent victory. With these vessels the young officer sailed up the lake to the islands, and there, off Put-in-Bay, he fought the battle of Lake Erie, September 10, 1813, the British fleet surrendering before sunset, and thereby giving up the whole lake to American control. The story of this battle has been told again and again, in prose and verse, in marble and oil. There is something in the motto which Perry hoisted just before the engagement which touches the popular fancy. "Don't give up the ship!" has become one of the people's sayings, and the dispatch announcing the victory, "We have met the enemy, and they are ours," has been adopted into the military language of the day; only Grant's "We will fight it out on this line, if it takes all summer," can compare with it. A deep principle often underlies a popular saying, as a deep feeling often underlies a popular song. Armies have ridden to victory on the chorus of a song, parties have carried a candidate into the White House on the wave of a saying. The class to which belongs George Eliot's Mr. Casaubon may, indeed, scorn any thing popular, but what are we all but people, and what is the world but the people's home!

After the battle the slain officers were buried on the shore of one of the islands: a willow-tree marks the spot. A remarkable incident, showing the power of sound, belongs to the story of the battle. A Cleveland pioneer was engaged that day in building the first log court-house on the public square, when suddenly he was startled by a sound which he supposed was thunder. There was not a cloud in the sky, however, and the wondering inhabitants gathered on the bank of the lake, thirty or forty in all, and looked toward the west, whence the strange sounds came. At length they recognized the report of cannon, and knowing that Perry's fleet had gone up toward the islands, they began to realize that a battle was taking place, and after a time actually distinguished the Amer-

THE STEAMER "MICHIGAN."—BURIAL-PLACE OF THE SLAIN IN THE BATTLE OF LAKE ERIE.

ican guns from the British, as the former were of heavier calibre. When, late in the afternoon, three loud reports were heard, evidently American, the listening band gave three hearty cheers, as sure of the unseen victory as though they had witnessed it from the shore of Put-in-Bay. The distance was seventy miles.

The next figures on the page of island history are the "patriots" of the Canadian movement for liberty in 1838. Sandusky was one of their points of rendezvous, and the islands were tempting strongholds; near Pelée Island they fought a battle with a force of British cavalry upon the ice, a novel battle-ground.

And now we come down to our own day, and face a figure not ten years dead—Beall, the pirate of Lake Erie. This young Virginian, an officer of the Confederate army, was hung as pirate and spy on Governor's Island, New York Harbor, February 24, 1865. The sentence was just, and its execution a necessary part of the discipline of war. Yet now that years have elapsed, and we can review the past without that terrible personal interest that made our hearts burn within us, there is something worthy of note in the story of this man, who, young, wealthy, and educated, threw himself, as it were, into the jaws of death from sincere though mistaken love for his native country.

John Yates Beall was a native of Jefferson County, Virginia. He graduated at the University of Virginia, Charlottesville, and at the breaking out of the rebellion owned a large plantation in his native county; his property was estimated at $1,500,000, and in addition he was said to be the heir of an estate in England. In the earliest days of the war Beall organized Company G, Second Virginia Infantry, and his regiment afterward formed part of the original "Stonewall Brigade," under Stonewall Jackson. He took part in many battles, but it is his piratical expedition among the islands of Lake Erie which brings him within the range of our subject—an expedition which ended in disaster and death. It is well remembered along the lake shore; Buffalo, Detroit, and Cleveland were filled with excitement; the citizens patrolled the streets by night, and visions of piratical craft sailing boldly in and firing upon the defenseless houses filled all eyes. Exhausted Ohio had sent into the field regiment after regiment beyond her quota, but her northern frontier was entirely exposed, and it seemed an easy thing to sail across from Canada and batter down her towns. Looking back upon it now, it still seems easy; and yet it was never done, although Canada swarmed with conspirators, under the leadership of Jacob Thompson, secret agent of the Confederate government. The United States had but one war vessel on the lakes, the *Michigan*, a paddle-wheel steamer, carrying eighteen guns. The capture of this boat would enable a small

body of men to carry destruction from one end of the lake to the other. In September, 1864, the *Michigan* was lying off Johnson's Island, Sandusky Bay, which had been used since 1862 as a dépôt for prisoners of war; here were confined 2480 men, all, with the exception of about one hundred, officers of the Confederacy, enough to command an army of 80,000 men. The little island was naturally uppermost in the thoughts of the rebel officers in Canada. It was near at hand, a steamer could run across in the night, and in the winter a land force could attack it, for the ice was strong, and nowhere was there more than five miles between island and island, stretching like stepping-stones across the lake from Point Pelée to the Ohio main-land. No other prison was on an exposed frontier like this, and were it not for the guns of the *Michigan* a rescue might be effected: the *Michigan*, therefore, must be captured.

On the morning of the 19th of September the steamer *Philo Parsons*, plying between Detroit, the islands, and Sandusky, left Detroit at the usual hour on her way down the river; at Sandwich, on the Canadian side, four men came on board, and at Malden a party of twenty more, bringing with them a large old-fashioned trunk tied with ropes. As at this period there was a constant stream of fugitives crossing the border, fleeing from the draft, or coming back with empty pockets, this Malden party excited no comment, and the steamer went on her way through Lake Erie, stopping at the different islands, and taking on a number of passengers for Sandusky. After leaving Kelley's Island, the last of the group, suddenly four men came toward the clerk, who, owing to the absence of the captain, had command of the boat, and leveled revolvers at his head; at the same moment the old black trunk was opened, and the whole party armed themselves with navy revolvers, bowie-knives, and hatchets, and took possession of the defenseless boat. The course was then changed, and after cruising about at random for some time the pirates turned back to one of the islands—Middle Bass—and stopped at the dock. While here the *Island Queen*, a steamer plying between Sandusky and the islands, came alongside, and, suspecting nothing, threw out a plank in order to land some freight. Instantly the pirates swarmed up her sides, calling upon the captain to surrender; shots were fired—apparently more for the purpose of intimidation than for any real injury—knives and hatchets were held over the passengers, among whom were thirty or forty one-hundred-days' men on their way to Toledo to be mustered out. The pirates were few in number, but they were well armed, and held both steamers at their mercy. The captain of the *Island Queen* made sturdy resistance, endeavoring in vain to cut the ropes that bound his boat to the *Parsons;* and the engineer, refusing to obey the orders of the pirates, was shot in the cheek. Resistance was evidently useless; the passengers were put into the hold, with a guard over them, and the captain was asked if many strangers had come to Sandusky that morning, and if there was any excitement there. After some delay and discussion among themselves the pirates decided to exact an oath of secrecy for twenty-four hours from the women and citizen passengers, and allow them to go on shore, together with the hundred-days' men, whom they paroled, and then the two steamers, lashed together, started out toward Sandusky, the captain of the *Island Queen* being retained, with the hope that he could be forced to act as pilot. When four or five miles out the *Island Queen* was scuttled and abandoned, and the *Parsons* went on alone. A debate sprung up among the pirates as to whether or not they should run into Sandusky Bay; evidently something had failed them, some one had disappointed them. At length the captain was again put into the hold, the boat's speed was slackened, and she was kept cruising up and down outside as if waiting for a signal.

Chief in command of these raiders was John Yates Beall: his appearance and manner rendered him conspicuous among the others, who are described, in the language of one who saw them, as a "mean, low-lived set; Burley, the second in command, being a perfect desperado." In the report of Jacob Thompson, secret agent of the Confederacy in Canada, a document belonging to the rebel archives, the whole plot is related. There were two parts, the first being the expedition by water under Beall, and the second a conspiracy on shore, by means of which the officers of the *Michigan* were to be thrown off their guard, so that upon a given signal Beall could steam rapidly in, surprise them, and capture the boat. A cannon-shot sent over Johnson's Island was to tell the prisoners that the hour of rescue had come; Sandusky was next to be attacked, and after horses had been secured the prisoners were to mount and make for Cleveland, the boats co-operating, and from Cleveland strike across Ohio for Wheeling and the Virginia border. The key to the whole movement was the capture of the *Michigan*.

The plot on shore was headed by a Confederate officer named Cole. As has been related, Beall performed his part with entire success; and had the other head possessed equal capacity, no doubt the plan would have been successful, and the whole North taken by surprise at this daring raid and rescue upon a hitherto peaceful and unnoticed border. The two thousand young officers riding for their lives through the heart

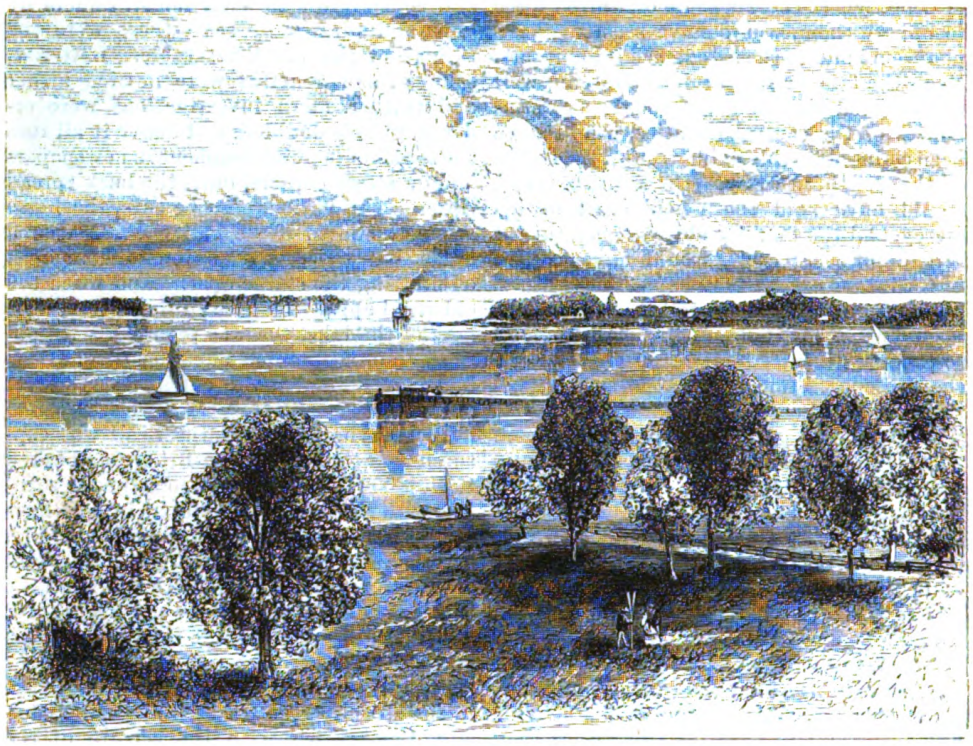
of Ohio, where there was no organized force to oppose them, would have seemed like a phantom band to the astonished inhabitants. Even the famous raid of John Morgan, well remembered in the great red-brick farm-houses of the central counties, would have been eclipsed by this flying troupe, the flower of the Southern army. On the lake Beall would have held the whole coast at his mercy, and the familiar old *Michigan*, turned into a piratical craft, would have carried terror into every harbor.



But the plot on shore failed. Cole spent his money freely in Sandusky, and managed to procure an introduction to the officers of the *Michigan*, inviting them to supper-parties, and playing the part of a genial host whose wines are good and generously offered. The tedium of the daily life upon the steamer and in the small town was enlivened by his hospitality, and for some time all went well; but gradually he began to mar his own plot by so much incautiousness and such a want of dexterity in his movements that a suspicion was aroused in Sandusky, and his manœuvres were watched. On the evening of the 19th of September Cole had invited the officers of the *Michigan* to a supper-party. Every thing was prepared for them, the wine was drugged, and when by this means they had been rendered helpless, a signal was to notify Beall that all was ready for his attack. But in the mean time suspicion had grown into certainty, and at the very moment of success Cole was arrested by order of the commander of the *Michigan*, the signal was never given, and Beall, on board of the *Parsons*, strained his eyes in vain toward Sandusky and Johnson's Island, cruising up and down outside the bay, now talking with his prisoner, the captain, and now urging his men to dare all and make the attack alone. But the men, a disorderly rabble gathered together in Canada, refused to enter the bay; and at last, disappointed and disheartened, Beall gave the signal to turn the boat, and abandoned the attempt. Back went the *Parsons*, with her pirate crew, past Kelley's Island, where the alarmed inhabitants were burying their valuables, and looking for the flames of burning Sandusky; past Middle Bass, where the unfortunate passengers, watching on the beach shortly after midnight, saw her fly by, the fire pouring out of her smoke-stacks, and "making for the Detroit River like a scared pickerel." The captain and those of the crew who had been retained to manage the boat were put ashore upon an uninhabited island, and after reaching the Canadian shore and scuttling the steamer, the pirates disbanded, and Beall, the master-spirit, was left to brood over a failure which had the additional bitterness of possible success.

In the morning the lake-country people woke up to hear the news. Incendiaries and conspirators in their midst, raiders by land and pirates by sea—these were the tidings of the breakfast-table. Batteries, soldiers, and generals were hurried hither and thither, stern investigations were ordered, guards doubled, and above it all rose the sound of popular comment in newspapers and on street corners, until the buzz spread through the nation. To be sure, the horse was not stolen, if we call the *Michigan* a horse, but there was an immense amount of shutting the stable door. And when the old steed appeared again in the various harbors of the lake, she was regarded with curiosity and redoubled affection as one who had indeed snuffed the battle, though from afar.

In less than four months Beall was captured near the Suspension-Bridge, and taken to New York. An attempt to bribe the turnkey with three thousand dollars in gold having been discovered, the authorities sent him to Fort Lafayette, and while there he made an appeal to the bar of New York to undertake his defense. For a time no one responded, but at length Mr. James T. Brady offered his services, and the trial began before a military court. Beall was charged with the seizure of the steamer *Philo Parsons* at Kelley's Island, Lake Erie; with the seizure of the steamer *Island Queen* at Middle Bass Island, Lake Erie; with being a rebel spy in Ohio and New York; and with an attempt to throw the express car off the track between Buffalo and Dunkirk, for the purpose of robbing the express company's safe. The officers of the captured steamers came from the West to identify him, and it is said that Beall frankly confirmed their testimony, remarking that as regarded the lake affair the trial had been fair and impartial. In the defense a manifesto from Jefferson Davis was offered, asserting that these acts upon the border were committed by his authority, and should be recognized as the acts of lawful belligerents. But the court pronounced the verdict of "Guilty;" and General Dix approved the finding, ordering the prisoner to be hung on Governor's Island, Saturday, the 18th of February. In reviewing the testimony, General Dix said: "The accused is shown to be a man of education and refinement, and it is difficult to account for his agency in transactions so abhorrent to the moral sense and so inconsistent with all the rules of honorable warfare." In this opinion all just-minded persons will agree. And yet, as an example of judgment, mistaken but equally sincere, an example of perverted mental vision, take the farewell letter of Beall to his brother, written on the eve of the day appointed for his execution:

"....Remember me kindly to my friends. Say to them that *I am not aware of committing any crime against society.* I die for my country. No thirst for blood or lucre animated me in my course....My hands

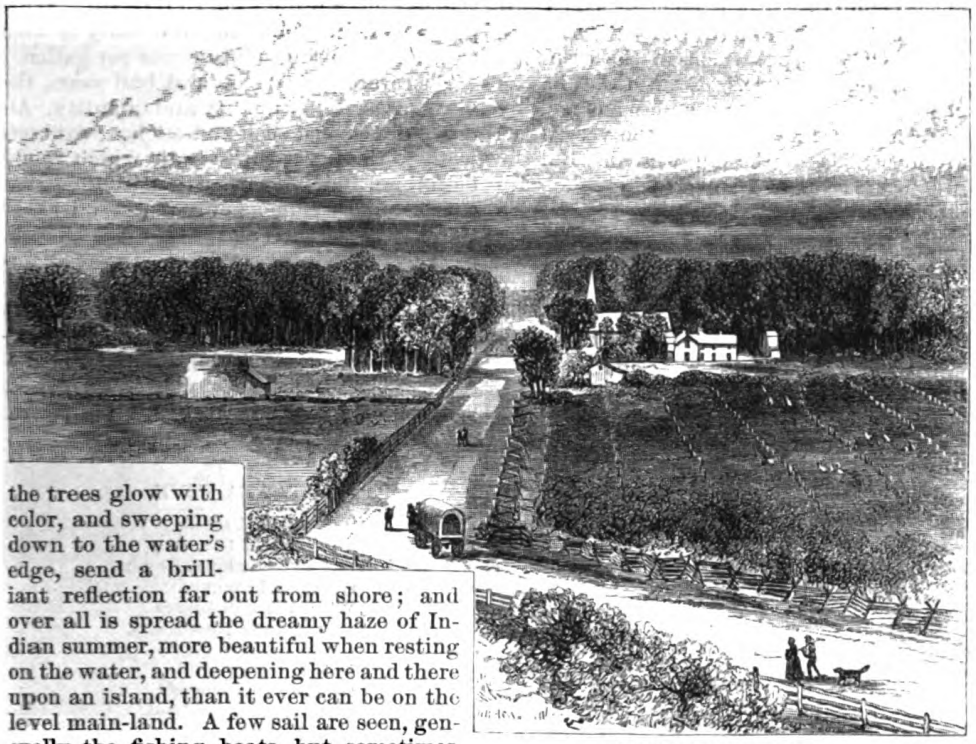
PUT-IN-BAY SCENERY.

are clean of blood, unless spilled in conflict, and not a cent enriched my pocket.... Vengeance is mine, saith the Lord, and I will repay. Therefore do not show unkindness to the prisoners; they are helpless.



"JOHN YATES BEALL."

A short respite was afterward granted by President Lincoln to enable the mother to see her son; but on the afternoon of the 24th of February the execution took place, upon Governor's Island, New York Harbor, the prisoner responding to the prayers of the Episcopal service for the dying, but otherwise remaining apparently unmoved. One item in the newspaper accounts of the day is worthy of note. During the whole of the long proceedings before the execution the young man kept his eyes steadfastly fixed upon the southern horizon, as if looking toward the very heart of the country for which he was giving up his life.

Beall was finely formed, about five feet eight inches in height, with hazel eyes, brown hair and beard, and a firmly compressed mouth. He was thirty-two years old at the time of his death.

The islands are now free from alarm, the prison barracks on Johnson's, in the bay, are gone, and nothing warlike remains save a few earth-works and traditions of the past, which mingle the stories of 1813 with those of 1864. Grapes are every where: the long ranks of the vines stretch from shore to shore, and even the talk is fruity. Grapes are fastidious in their choice of a home; here they will and there they will not grow. One side of a field they accept, and the other side they reject, and in many localities they refuse to show even a leaf on the trellis. If the soil is unfavorable for the vine, no art can render it favorable. But here on this southern shore of Lake Erie, and upon its islands, the grape flourishes in unrivaled luxuriance, and even the banks of the Ohio, the first stronghold of the Catawba, have been forced to yield a precedence in many points to the northern rival. Many crops are useful, but few are in themselves beautiful; digging potatoes, for example, can never figure upon the poet's page. But every thing connected with a vineyard is full of beauty, whether it be the green leaves and twining tendrils of the spring, the bunches slowly turning in the hot midsummer sun, the first picking in early fall, when the long aisles are filled with young girls making merry over their work, or the last ingathering of the Indian summer, when the late-ripening bunches hanging on the bare trellises shine through the vineyards in red-purple gleams as far as the eye can reach. Nothing can be more lovely than the islands in this golden season; Dionysius himself would have loved them. The water is blue and tranquil, for even in a gale the fury does not enter here among the land-locked harbors; on all sides stand the islets, some large, some small, some vine-covered and inhabited, others rocky and wild;

ON PUT-IN-BAY ISLAND.

the trees glow with color, and sweeping down to the water's edge, send a brilliant reflection far out from shore; and over all is spread the dreamy haze of Indian summer, more beautiful when resting on the water, and deepening here and there upon an island, than it ever can be on the level main-land. A few sail are seen, generally the fishing boats, but sometimes comes a Lake Erie yacht from the shore cities, bound to or from the duck marshes far up Sandusky Bay.

Gibraltar Island, a mere dot in the water, is crowned by a villa whose tower forms a picturesque point in the landscape. This islet is a country-seat belonging to Mr. Jay Cooke, the banker, and upon its rocky summit is a memorial of Commodore Perry, overlooking the scene of the battle of Lake Erie. Upon Kelley's Island also there are some handsome residences, and no doubt they will be built all through the archipelago wherever a point or a headland can be spared from the grapes. "Oh," said our oarsman, as we floated near the Needle's Eye of Gibraltar, "my brother-in-law could have bought the whole island for seventy-five dollars!"

"Why did he not do it, then?"

"Oh, he never thought as how the old rock would be worth so much; that was before folks took to coming here, and there wasn't many grapes either."

Thousands of dollars are now asked for the smallest island.

Kelley's, the largest of the group, possesses, in addition to its vineyards, valuable limestone quarries, from which the furnaces from Erie, Pennsylvania, to Marquette, Lake Superior, draw their supplies of lime and flux stone. It has 836 inhabitants, five schools, and four churches.

Put-in-Bay Island has 600 inhabitants, and two large hotels, which are filled in the summer with Southerners fleeing from Missouri and Kentucky heat; they find Lake Erie air quite cool, while the Lake Erie people, panting and oppressed, fly by on steamers, and stop not until they reach Mackinac or Lake Superior. Meanwhile the Lake Superior people make excursions to the north shore; and no doubt when the north shore is settled, the inhabitants will spend their summers at the arctic circle. The scenery of the islands is never grand, but always lovely. The tired brain is not excited to the work of admiration or wonder, but it can find restful pleasure floating on the quiet water in the shade of the cliffs, or dreaming away the days in the beautiful vineyards. We all have our moods when we ask, like the lotos-eaters,

> "Why are we weighed upon with heaviness,
> And utterly consumed with sharp distress,
> While all things else have rest from weariness?"

At such times the islands are like the "land in which it seemed always afternoon," and coming here, the weary can fall "asleep in a half dream," and take sweet rest after their labors in the busy main-land towns.

America has so long imported its wines that it hardly yet realizes the presence of a native production. The wine of the islands is of several kinds, the best known being the dry Catawba. The expression "juice of the grape," however, misleads the ignorant, who fancy that grapes and a press are all that is necessary. This idea is like that

of the young lady who, upon being asked how she would prepare a dish of baked beans, replied, "Why, put them in the dish and bake them, of course." Every thing has its chemistry, even beans; and wine-making is chemical science, whereof the very terms are mysterious to the uninitiated. But the grapes in the heaped barrels and baskets are a sight worth seeing, and the presses, with the juice flowing out in a fragrant stream, bring the Old Testament to our minds, the days when the new wine was preferred to the old. Down in the cellars of the wine-houses, under the presses, stand rows of giant casks, and the superintendent fills a glass from each to show the wine in all its stages. It is good—very good; and as it is native, it is cheap—cheap when compared with even the poorest imported mixture. It has often been asserted that the inhabitants of a vine-growing district are never intemperate. The purity of the wine prevents the excitement produced by vile compounds, and its very plentifulness teaches its proper use. There is no need to slip away into obscure places to get it; there is no need for deception or excuse. Every body has it, every body drinks it, and the fascination of rarity is gone. If this is true, the native wines should be brought into common use as an antidote against the deadly liquors which so soon blunt the heart and destroy the mind of man. Throughout the West already have they won their way, and gradually are they penetrating into the Eastern markets. Not rapidly, however, for it was only last summer when, after ordering a bottle of dry Catawba, which by some chance had got its name upon the wine list of a fashionable watering-place hotel, the head waiter brought us "sparkling Moselle," with the assurance that it was "just the same wine—exactly the same." The statistics of the grapes and wine for one year will give an idea of the extent of the production:

Number of acres in bearing in Ottowa County and the islands	2,089
Total product, in pounds	7,462,750
Grapes sold, in pounds	118,000
Number of gallons of wine made	812,184

The grapes bring from five to eight cents per pound, and the common quality of wine at wholesale brings sixty cents per gallon.

There are good years and bad years, the vintage varying in quality and quantity. Already the wine of such-and-such a year is offered to the guest with an air which would be foreign if it was not so entirely native; old-fashioned connoisseurs know all about the vintage of such and such a year, but in their day the vintages spoken of were all foreign.

They are not all foreign now. The native Bacchus is young and modest, but his followers will gather around him before long. Already the native poet, America's greatest, has not been ashamed to chant his praises in the following verses:

CATAWBA WINE.

This song of mine
Is a song of the vine,
To be sung by the glowing embers
Of way-side inns
When the rain begins
To darken the drear Novembers.

It is not a song
Of the Scuppernong
From warm Carolinian valleys,
Nor the Isabel,
And the Muscadel,
That bask in our garden alleys.

Richest and best
Is the wine of the West
That grows by the beautiful river;
Whose sweet perfume
Fills all the room
With a benison on the giver.

Very good in its way
Is the Verzenay,
Or the Sillery soft and creamy,
But Catawba wine
Has a taste more divine,
More dulcet, delicious, and dreamy.

Pure as a spring
Is the wine I sing,
And to praise it one needs but name it,
For Catawba wine
Has need of no sign,
No tavern-bush to proclaim it.

H. W. Longfellow.

TO-MORROW.

I.

Down in the blossomy orchard she sat, and sang to herself
An idle and ancient ballad of king and giant and elf,
Set to a dull old measure, crossed by a weird refrain,
Yet the pulse of the singer's gladness beat wild in every strain.

Bird songs were echoed around her; each gay breath of the breeze
Made love to a world of blossoms already trothed to the bees;
Shadows, courted of sunshine, flecked the leaves and the ground,
And the subtle odors of summer filled all the air around.

Flouting the merry young clovers and kingcups yellow and fine,
A bit of a brook danced onward, nor recked of shade or of shine.
Sky-heights flooded with sunshine, lines of river and hill,
Made the heart of a distant picture tinted at Spring's sweet will.

"BUSILY WORKING AND SINGING, SHE WOVE THE WREATH AND THE VINE."

Busily working and singing, she wove the wreath and the vine
Over the threads of the linen in many a fanciful line;
Busily working, and singing of king and giant and elf,
In the midst of the quaint old ditty she softly laughed to herself.

Slowly the notes of the ballad strayed into silence and died;
Robins and bees kept the chorus shrill and cheery and wide;
Then, musing in that old fashion that maidens understand,
Unheeded the folds of linen slid from her careless hand.

"Ah, how lovely the world is! I could never be sad!
Why, the sun and the blossoms *alone* could make me glad!
I am so happy, so happy, I scarce have one regret—
But, ah! to-morrow, *to-morrow*, I shall be happier yet!

"Birdie, up in the branches, sing me your prettiest lay;
Don't grow weary of trilling your clear little songs to-day;
Because to-morrow, my birdie—ah! now you have taken wing—
Some one I know of may listen and hear you when you sing.

"Somebody's coming to-morrow: I would not care to tell
The leaves and the little flowers the name I love so well.
I am sure he is coming—and sure of something more:
If thoughts and wishes could bring him, he would have come before.

"Only a week since Monday—how long a week can be!—
Monday night, in the gateway, he said good-by to me;
And then—but I am forgetting something else that he said—
He said good-by's would be over when he and I were wed.

"When he and I are wedded! Ah, that will be so soon!
To think of the long years lying beyond this afternoon!
Only a day! so little out of a whole long life!—
Before to-morrow is ended, I shall be his wife.

"I can see him before me, just as he looked that night,
Standing under the lilacs, facing the sunset light,
Turning back in the gateway to kiss me once again—
I hope he will look to-morrow just as he lookéd then.

"Some time, far in the future, when I am old and gray,
I shall like to look back and think about my wedding-day.
I am glad it is coming just in the last of Spring,
The time for flowers to blossom, the time for birds to sing.

"When I am wrinkled and feeble, and like to sit all day
In the sunlight or the fire-light, and while the time away
With little tasks, and with stories of all that used to be,
Of the old days and old faces that were so dear to me,

"Perhaps I shall then remember how oft I have sat alone
Down here in this little orchard upon this mossy stone,
Planning and hoping and dreaming, as girls so like to dream,
Telling my fortune with daisies, watching my face in the stream,

"Wondering, wondering always what I should do and be,
And what the life that was coming might have in store for me.
Perhaps I shall drop my knitting and smile and wonder again
To think of the grand air castles that seemed so solid then.

"Truly, it matters little what else my life may bring,
Because it has brought me Roger—so says this golden ring!—
And not Aladdin's genii, with all their wondrous art,
Could bring me a gift so priceless as is one loving heart.

"I would like to be dancing, dancing the whole day through;
But I am a grown-up woman, and that would never do.
Hark! the clock in the village is striking—one, two, three—
(I wonder if Roger is thinking about to-morrow—and me!)

"There, my scissors and thimble have fallen into the stream!
Here I am idly losing half the day in a dream!
Sometimes, when I am thinking, the days seem one and all
Only a dream that passes like sunshine on a wall!

"It will be strange to-morrow, strange to be dressed in white,
With all the people gazing, on the left and the right;
Stranger still to be thinking that Roger belongs to me
And I belong to Roger through all eternity!

"We shall be happy—happy if good or ill betide—
Because we love each other better than all beside.
Better than God, I wonder?—I think God likes to see
Just such a happy marriage as Roger's and mine will be!

"Roger will think me pretty—he always thinks me so—
But I shall be blushing scarlet half the time, I know.
And it all will be so solemn, the promises and the prayer—
But then how many are married and never seem to care!

"Some one's calling: I wonder if they are calling me?
I think I will leave my dreaming a while and go and see.
Shadows are getting longer, long as the afternoon:
Thank you, my lady shadows—bring me to-morrow soon."

Gathering up the linen, scissors, thimble, and thread,
She hastened across the grasses with light and careless tread,
Out where the fields were sleeping in sunshine's rich content,
Tossing the curls from her forehead, and singing as she went.

Down in the blossomy orchard the shadows grew and grew,
And the robins and the blackbirds sang all the songs they knew.
Sunset wedded the twilight, crowned with a crescent moon,
And the night awaited the morning—coming, now, so soon.

II.

The sun was up, the world was gay,
And only softest breezes blew.
Laden with many a bloomy spray,
She brushed aside the morning dew.
Her eyes were happy as the day
That shone upon the world anew;
Her wavy hair was bound away
From brow and neck with ribbons blue.

Her gray-haired father in its place
Laid by the ancient Testament,
Glanced up and smiled to see her face
So bright with beauty and content.
Her mother, busiest of the race
Of housewives, in her aspect blent
With cheerfulness a quiet grace,
By simple ways and duties lent.

Her sisters, laughing in the door,
Were wreathing flowers with busy skill;
Upon the sunny steps and floor
The wind strewed leaves and blooms at will.
The blossomed boughs kept sweets in store
For bees that had their hives to fill,
And peacefully the sky spread o'er
The distant stretch of wood and hill.

The morning, like a happy child,
Seemed sent from Heaven, full of glee;
Above the dew-wet world it smiled,
And made the noon and dawn agree.
The orioles, with trillings wild,
Sang roundelays in many a tree;
And, high in air, the lark beguiled
The passing hours with melody.

The little winds, in courses free,
Lingered and tossed her tresses o'er,
As if so fair a bride as she
Had never sat in cottage door.
The streams of sunshine merrily
Poured in upon the walls and floor,
As if, since days began to be,
No wedding-day had come before.

And happy repartee and jest
Were tossed about among the girls:
"See, here is rue for Roger's vest,
And dandelions to trim your curls."
"How beautifully we'd be dressed
If only grooms were knights and earls!
I wonder, Mary—you know best—
If Roger cares for crimps and quirls?"

"When once *her* wedding-day is o'er,
We may have time to think of ours:
It's well to settle long before
About the bride-maids and the dowers."
"I'll hang this wreath above the door,
And loop the curtains back with flowers—
A single spray—it needs no more—
And leaves will keep it fresh for hours."

"Now, Mary, when you're saying 'Yes,'
You mustn't look at Sue or me:
Just count the ruffles on your dress,
Or blossoms on the apple-tree.
Roger'll be grave enough, I guess;
I hope you'll do as well as he.
I'm sure I wish you all success
In putting on your dignity!"

"Roger be grave?" "Well, hardly that;
But graver than his wont, I trow:
I'll give his arm a friendly pat
If he forgets and answers 'No.'
You'll stand just here, where father sat
When James was married long ago;
Right on the border of the mat
Between the door and window—so.

"And Roger, with his careless grace,
Will look as handsome as a king;
And you!—a rose will match your face—"
"Dear me! If Roger drops the ring!"
So, chattering all about the place,
They set the witnesses of Spring,
And left a little subtle trace
Of love and care on every thing.

But she, half laughing at their talk,
Kept watchful eyes upon the gate,
The road's far windings, white as chalk.
Then Maud said, gayly, "Roger's late!
Let's promenade along the walk,
And scold because he made us wait;
Let's gather each a tansy stalk,
And 'wear a weed' in widowed state!"

The ancient clock upon the wall
Was pointing out the sign of ten,
And shaded parlor, shaded hall,
Seemed fit for haunt of fairy men.
The snowy blooms inwreathing all
Made shadows white; and now and then
A passing breeze let odors fall,
And wandered into sun again.

"Why, where is Roger? See how late!
At nine, we thought, he must be here!"
"Well, time and tide can never wait:
The noon will bring him, do not fear."
But like a bird without a mate,
Restless and seeking what might cheer,
Flitting between the door and gate,
She waited, straining eye and ear

To catch the first faint, distant sign
Of his approach; and near and far
The fields lay fair in shade and shine;
No cloud the breadths of sky did mar;
The narrow way-side paths were fine
With many a blossom-cup and star,
And far along the road's white line
The cattle grazed by wall and bar.

The morning hours passed one by one;
The noon came with its world of gold;
The petty household tasks were done,
And friends were gathered, new and old;
And all the wedding mirth begun,
And jests were made and tales were told:
But still he came not, though the sun
Chased shadows from the wood and wold.

Within her chamber, new arrayed
In laces' fairy gossamer,
She sat and wondered, half afraid,
And starting at the breezes' stir;
And starting if a bird betrayed
Its nearness by a chirp or whir—
Amazed, and doubting, since he staid,
What cause his coming might defer.

Her sisters, gay an hour ago,
Sought comfort in each other's eyes,
And filled the moments' tardy flow
With hasty questions and replies.
The wedding guests who sat below
Whispered their comments and surprise.
The mother, moving to and fro,
Still kept her gentle, cheerful guise.

The ancient clock, bedecked with flowers,
Was pointing out the sign of two:
Too swiftly now the busy hours
Moved onward in the courses due.
The bridal presents, loving dowers
Of old affection proved anew,
Lay underneath their tiny bowers
Unheeded; and the moments grew,

And made another hour. The while
She waited, grown heart-sick with dread,
Her sisters sought with harmless guile
To smooth the careful words they said,
And tried with many a winning wile
To scatter fears that silence fed.
Still, with white lips she tried to smile,
But turned away and wept instead.

"He may be ill." "If that were so
He must have sent us some brief word."
"We had the note two days ago."
"Perhaps some new delay occurred."
"I never knew the time so slow."
Said one, in whispers scarcely heard,
"How strange! If we could only know!
His coming *could* not be deferred!"

"And then, what *will* the people say?"
"Oh, hush! speak lower; she may hear."
"Is that a dust-cloud, far away
Upon the road, and coming near?"
"It is! it is! I hope and pray
It may be Roger! Little fear
But that it is. A wedding-day
Without a bridegroom *would* be queer."

"WHAT WAS IT THAT I HEARD HIM SAY?"

The noise of wheels had reached her ear,
  The tramp of horses driven fast:
How quickly every brow grew clear
  That clouds of doubt had overcast!
And, laughing out with sudden cheer,
  She cried, "Ah, he is come at last!
I knew I had no cause for fear,
  But yet, thank Heaven the fear is past!

"I wonder what has kept him so!
  And see—my eyes are swollen and red—
They're only at the bridge. How slow!
  Tell me when they are near!" she said.
She smoothed the laces' tumbled snow,
  Bewreathed the flowers that crowned her head,
Smiled at the mirror's pretty show,
  And paced the floor with restless tread.

"They're here, and there is Roger!" "Nay,
  That is not Roger!" "Why, who, then?"
"A stranger, and his hair is gray."
  "But Roger's with him. Look again!"
"No. Now he's at the door; but stay—
  Listen. They asked him 'where?' and 'when?'
What was it that I heard him say?
  The Erie Railway? Found at ten?"

A knot of people in the door,
  And voices loud, then hushed and low:
"How many killed?" "You say at four?"
  "A crowded train!" "If *she* should know!"

"Dead when you found him?" "Long before—
  And killed, I think, by one hard blow.
He must have lain six hours or more
  Netted within the ruins so.

"He had this letter in his hand;
  It said he was to wed to-day.
I thought, perhaps—you understand—
  The news might come some harder way."

Only a girl's despairing cry
  Ringing across the sunny air,
A murmur, fading to a sigh,
  Then sudden silence every where.
And none had known that she was by,
  And none had thought to save or spare.
They stared, aghast. "Was she so nigh?"
  "You did not tell me *she* was there!"

And still the summer breezes fanned
  Each tiny leaf and bloomy spray,
And still throughout the happy land
  The blossoms told that it was May;

For hearts may break and loves grow cold
  Betwixt the morning and the eve,
And still the sunset gives its gold
  To those who smile, to those who grieve;
And graves are filled and men grow old,
  And still the busy seasons weave
New lives and loves; and last year's mould
  Covers the dust of those they leave.

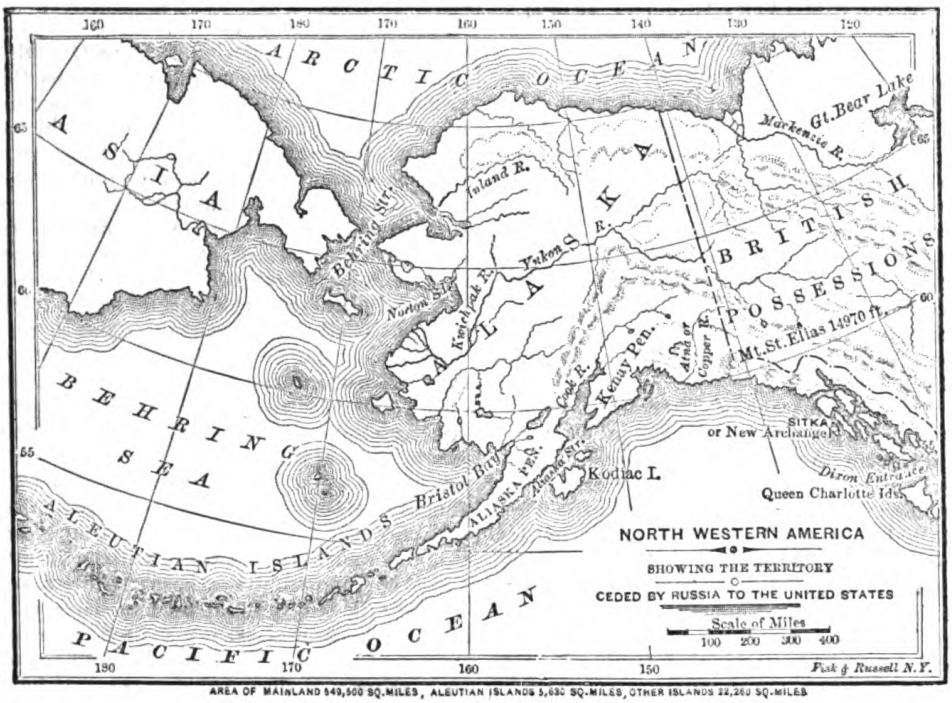
WHAT SHALL WE DO WITH SCROGGS?

By CHARLES NORDHOFF.

ACCORDING to the latest returns, there are in the United States forty-one State-prisons, of which New York has three, Pennsylvania and Indiana two each, and the other States one each, with the exception of Delaware, where the whipping-post saves them the expense of a penitentiary. The number of county jails is over two thousand; and there are, besides, houses of correction, local penitentiaries, etc., for adults, to the number of twenty-five, chiefly in New York and Massachusetts.

The State-prisons of this country contain at this time about 16,000 convicts; and there were in May, 1872, about 38,500 persons in confinement for various crimes and offenses, in prisons of all kinds, in the whole United States. It thus appears that, according to the formula of a sarcastic Frenchman, the detected and convicted are to the undetected part of our population as about one to one thousand. But as the imprisoned part is mostly between sixteen and forty years of age, a truer comparison would be with the population comprised between those ages, and this would give about one to every 450 in a jail of some kind.

When a man or woman is sentenced to prison for a term of years, society ceases to trouble itself about him almost as much as though he had been happily shot or hanged. While he remains in prison he is clothed, warmed, and fed, and more or less disciplined, at society's expense, and, like a naughty child shut up in a closet, he does not "bother" any body except his keepers. When his term is served he is summarily turned out from the place which has meantime become home to him; and with his old clothes, and enough money to pay his way to the nearest big city, he is left to do what he chooses—or rather what necessity, weakness, ignorance, the force of old associations, the desperation of loneliness, all combined, may tempt him to do. His readiest friends are his old companions in vagrancy or crime, and the top of his ambition is to maintain his place among the great mass of the undetected. If the police is too crafty for him, if he is again caught, society, virtuously indignant, sends him back to prison, where, of course, he figures as an incorrigible, and receives double doses of discipline, hortatory and otherwise. In some few cases he reforms, and becomes a more or less useless member of society. But all who have had to do with criminals report that genuine and lasting reform is but seldom found, and that when a boy once gets into jail, he will probably continue to prey upon society as long as he lives, and that on the score of economy, and leaving humanity out of view, it would have been better to shoot or hang him at the beginning.



The general conviction that, as Quetelet puts it, "it is society which prepares the crime, the criminal being only the instrument which executes it," has become so deep that society has in modern times conscientiously imposed upon governments the task of not merely confining but of trying to reform its criminals. With society organized as at present—that is to say, very rudely, imperfectly, and selfishly—we know that, given a certain density of population, and we shall find a certain definite and predicable number of thefts, of robberies, of burglaries, and murders. The diffusion of intelligence, the decrease of intemperance, and other circumstances affect this result, but they are themselves affected by density of population, and it remains true that the statistician can foretell with startling correctness how many thieves, burglars, robbers, and assassins there will be in any Christian community whose numbers per square mile he knows. Society being constituted as it now is, a certain proportion will be criminals, just as a certain other proportion will be dyspeptics, or will have weak eyes, and another proportion will be virtuous, self-denying, conscientious, and irritable. The burglar is as much the natural and legitimate product of society as Jim Fisk was the inevitable result of the indecent scramble for wealth, and the semi-barbarous love of ostentatious living which distinguishes New York.

When, therefore, Scroggs is detected, convicted, and sentenced to Sing Sing, society is guilty with Scroggs; and knowing this, it enjoins upon Scroggs's keeper that he shall not torture Scroggs, that he shall give him enough to eat, and a fit place to sleep in, that he shall cause Scroggs to be instructed in letters and morals, and that he shall in general try to prepare him to become a useful member of society, instead of a beast of prey. And in order that all this may be done, and thus the guilty social conscience be put at rest, society, which is an Ass, puts politicians in the places of prison managers and inspectors, and then goes about its business. *Its* duty is done.

By-and-by Scroggs has served out his term, and unless he was a ward politician—in which case he is all right, and can take up his old calling without delay or hinderance—he is turned out of prison presumably reformed, with good impulses where bad ones were, with virtue triumphant in his bosom, and with an old suit of clothes on his back, and a dollar and a half in his pocket.

Now, if it was the duty of society to make a *man* of him, it has conspicuously failed. If it owed him any thing, it owed him far more than it gives him. For the most part,

it has not even given him good superiors in prison. Within five years, on an investigation into the management of one of the New York State-prisons, an intelligent convict deposed that the prisoners were the only reputable people in the prison, and there was reason to believe at the time that he did not exaggerate. What with contractors who make fortunes out of the convicts' labor—it is in evidence that a profit of fifty per cent. per annum on the capital thus invested is very moderate, and that a hundred per cent. is not unknown; what with politicians filling the places of keepers and subordinates, and making percentages of their own; what with such extravagance in management that, according to an official report, in 1857, 1890 prisoners in New York cost $112 54 per head, and in 1865, 1885 prisoners cost $220 per head; that during twenty-three years, also in the New York prisons, the average per diem for the hire of convict labor increased only fifty per cent., while in the same time the cost of maintaining the prisons increased 300 per cent., and that in the same time the State-prisons cost, to maintain, ten millions, while the convict labor yielded four millions, leaving a deficit of six millions, of which $5,340,000 have been actually raised by taxation within the last six years—with such examples of greed, incapacity, faithlessness to trusts, lack of economy, and general mismanagement before them, how can we expect the reformation of convicts confined in State-prisons?

In fact, they are not reformed; and if they were, their condition when they become freed men would not be much better than now. The ruling principle of prison management in modern times is that the protection of society against criminal spoliation shall be united with the thorough reformation of the transgressors. But suppose the criminal *is* morally reformed, is it not a fact that the life in prison has unfitted him for contact with the world outside; that he comes out a weakling in the race before him; that his life is a failure to begin with, and no career, however humble, opens to him where he may hope to rise and to make the best use of his energies? B. K. Pierce, chaplain of the New York House of Refuge, touched the marrow of this question in an address before the Prison Congress last year. He said:

"At this day there are thousands of young men and women, under twenty but over sixteen years of age, in penitentiaries. As these prisons are now conducted, their condition is, humanly speaking, hopeless. There are now no persons outside the prison walls prepared to receive and encourage discharged prisoners in any considerable numbers, except their old criminal companions. These are ever ready to meet them as the door of the prison opens, and to offer them shelter, food, and encouragement in a dishonest course. No counting-room, mechanic's shop, or even farm labor invites a young discharged prisoner to earn an honest living. If the man will not starve, he must steal. He is thus made a bitter enemy of society, and becomes desperate in the inevitableness of his condition. 'They will all as certainly come back here, or be sent to another prison, after their discharge, as they live,' said the warden of a penitentiary to me a few weeks since, as we stood gazing upon a gang of a hundred or more young men, averaging eighteen years of age, lazily at work in a stone-quarry connected with the prison. 'Where else can they go?' he asked."

Now what is a criminal? He is a person who has violated the laws, and who threatens the security of society. Society, impelled by a just instinct of self-preservation, undertakes to seclude him for a space of time. He is put where, first, he shall have no power for mischief; second, he shall have opportunity to consider his errors; third, he shall be subjected to such discipline as will make him a law-observing and authority-respecting rather than a law-defying creature; fourth, he shall receive instruction, moral and otherwise, which society neglected to give him in his earlier days.

So much society has a right to do, and ought to do, but it has no right to destroy or seriously impair the criminal's chance in life after the expiration of his term of punishment, for to do this is to injure not merely the man, but society itself. I am not speaking here of the rights of criminals out of any morbid or mawkish sentimentalism such as leads many good but mistaken men to oppose capital punishment. The worst use you can make of some men is not to hang them: it is a summary and wholesome way of abating some nuisances. I should rather say that the worst use you can make of a man is to stick him into a State-prison for a term of years. Yet we are building several new State-prisons, and this in spite of such facts of mismanagement as have been stated —in spite of the fact that while contractors make fortunes and prison officers become wealthy, according to recent reports nearly three-fourths of the State-prisons are not self-supporting, and in spite of such a state of things as was exposed at the London Prison Congress by Mr. F. B. Sanborn. His words apply to the prisons of Massachusetts, probably among the best managed in the country. He said:

"In all, we may count for the Massachusetts prisons not less than 350 different official persons concerned in their management and inspection, the number of prisoners in them all never exceeding 3500 at any one time. From this we might infer that the Massachusetts prisons were thoroughly inspected, however perplexing might be the system under which it was done. But, in fact, there is no municipal inspector who has been in all the municipal prisons, no county inspector who has been in all the county prisons, few State inspectors who have been in all the county prisons or in any of the municipal ones, and no one person in the State who has ever visited all the prisons it contains. Consequently there is no proper knowledge any where of the relation of one part of the prison system to the rest, and no proper system at all, but only a confusion of laws, rules, boards, and details."

Mr. Sanborn said in the same report that "of 16,000 convicts in the State-prisons probably between 4000 and 6000 are receiving scanty instruction in schools of some sort; of 22,000 prisoners in local prisons not 3000 are receiving any secular instruction whatever. About 20,000 of the 38,000 prisoners are wholly illiterate, and of these less than 3000 are receiving instruction."

Now, in place of building new prisons, why should we not try exile—penal transportation? We have in Alaska an immense territory, in almost every respect well suited to be the scene of a penal colony. It is isolated, and escapes would be easily prevented; it is almost uninhabited; it has a chain of islands suitable for separate colonies; its climate on the coasts is sufficiently mild, and yet not tropical, but bracing and healthful; it offers few or no temptations to vagrancy; and yet it is a country in which convicts who had served out their time, or earned their discharge, could live comfortably, and build up a new and prosperous society.

At present Alaska is a useless and expensive possession. Two Federal artillery companies hold possession; but it lies too far out of the way to tempt settlers. Used as a penal colony, to which the most hardened of our convicts might at first be sent, it would offer a clear field for interesting and valuable experiments in the management and reformation of criminals. It is not sickly, like the French penal settlement of Cayenne; nor has it, like Australia, a climate so mild as to enable runaway convicts to live a vagrant life in the bush. It is a country in which industry and foresight are necessary to enable a white man to exist; and thus the natural conditions of life would help in disciplining the criminals sent thither.

Being controlled by the Federal government, it is probable that, if Alaska became a penal colony, West Point officers would be its rulers and guardians; and these, who are, above all, strict disciplinarians, are admirably calculated to manage rightly a convict population, which needs, above all other things, to learn obedience to authority, and to be subjected to rigid discipline of mind and body. Moreover, the graduate of West Point is, as a rule, a man of honor and a gentleman. He knows nothing about contracts; he performs his duty; he is honest and respectable; and under his rule, at least, the convict would not commonly have before him a pernicious example of greed, and other low forms of vice.

There would be no lack of work in Alaska for a penal colony, however numerous. The country has no roads; it has no public buildings; it has no mechanic arts; it would need, if it had a population, artisans of all kinds; and for half a century to come a penal colony in Alaska rightly managed ought to be self-supporting, with abundance of useful labor for every convict.

The question of penal transportation has not come very prominently before the public in recent years. It was not even discussed at the recent Prison Congress in London, though a report was read upon it by Count di Foresta, Procureur-General of

Ancona, who said: "Transportation with compulsory labor in a colony I approve as the best punishment for great criminals. It seems to me to answer perfectly the double object of all punishment—the protection of society, within the limits of justice, and the reformation of the convict. It fulfills the first of these objects—the protection of society—for the most dangerous criminals are thus cast out from the bosom of society; the grave inconveniences of relapse are avoided, and would-be criminals are deterred by the prospect of banishment from their country and family. The second object is equally met, that of moralizing these individuals, and giving them hope and the means of becoming again useful to themselves and society in another country, where, after undergoing part of their punishment, they can send for their families or found new ones, *thus beginning another existence in an entirely different atmosphere*, which will not seduce them into their former errors."

This is the true point—to so manage the criminal that when he has suffered his punishment he may have, at least, the chance to begin a new and better life, and to make even his period of punishment as natural and healthful as is consistent with his seclusion from general society. And this can be best done by exile or penal transportation. It is not done at all under the State-prison system.

Two companies of artillery and two revenue-cutters now hold Alaska. This force need be but very slightly increased to be sufficiently strong, with proper management, to control and keep under discipline a thousand convicts. The Aleutian Isles, the island of Kodiak, and the long Alaska peninsula offer themselves for isolated stations; and I do not doubt that our engineer officers could elaborate a plan of operations for a convict colony which would make such a colony self-supporting and helpful to the reformation of the convicts, bearing in mind always these words of that most successful manager of a penal colony, Captain Maconochie, under whose command that most terrible of English prisons, Norfolk Island, was the scene of so much genuine reform, that "the true principle is to place the prisoner in a position of stern adversity, from which he must work his way out by his own exertions, by diligent labor, and a constant course of voluntary self-command and self-denial."

The convicted criminal does not differ in many things from his fellow-man in freedom. He is gratified with labor if it is useful, and hates it if it is useless, as the tread-mill. He is the better man if his hope is excited, and he sees that good conduct will bring certain rewards. He is the better for living and working in the open air, and in the presence of wild nature. The rigor of military discipline he needs, because he has not learned to obey laws or to respect authority. The experience of Captain Maconochie on Norfolk Island, where he ruled over perhaps the vilest set of miscreants ever gathered together in one spot on this earth, the picked and double-dyed villains and scoundrels who were too dangerous for even Botany Bay, shows abundantly what can be done for and with the worst and most degraded men by a firm yet kind hand repressing and punishing evil, but always encouraging and drawing out good.

Two important points would be secured by establishing a penal colony in Alaska or elsewhere: First, society would rid itself, by a natural and proper method, of the human beasts who prey upon it, and threaten its security. It would say to the burglar, the robber, the confirmed thief, "You are no longer worthy to live among us; go into exile." And, secondly, we should provide a future and open a career in a new land to such of the convicts as chose to reform and live honest lives.

And though the first cost of transporting convicts to so far off a region might be thought large, it would in the end be an economy. We should not need to build or to mismanage new State-prisons. We should be spared the job involved in the construction, and the job involved in the misrule. West Point would rule in Alaska without jobbery and with efficiency, I believe, and, in the long-run, the convicts would cost the States far less there than they now do in the home prisons.

With children's aid societies to rescue the young from vice and crime, and deport our homeless children to the Western prairies, and with penal servitude in distant Alaska for the convicted criminal, we might hope to really and considerably decrease our criminal population.

DISAPPOINTED.

I THOUGHT, to-night, to see thy face,
And mourn not for the sun gone down;
But now the shadow in his place
Hangs on my cheated heart its frown.

I could not doubt that thy dear voice
Would cheer me more than bird or lute—
How can my heart to-night rejoice,
With bird and string and voice all mute!

The breath of June upon my cheek
I bore, impatient for thy kiss;
My fainting lips their anguish speak,
The sweetness of thy breath to miss.

Oh, why did thy sweet steps delay,
Since bird and song and breeze are gone?
Slighted for hope of thee, the day!
Without thee night puts sackcloth on!

Were I away, thou shouldst not chide
One heedless moment of delay;
I seek my sunshine at thy side—
Thy voice my song, thy smile my day.

A SIMPLETON.

A STORY OF THE DAY.

By CHARLES READE.

CHAPTER XIV.

STAINES fell head-foremost into the sea with a heavy plunge. Being an excellent swimmer, he struck out the moment he touched the water, and that arrested his dive, and brought him up with a slant, shocked and panting, drenched and confused. The next moment he saw, as through a fog—his eyes being full of water—something fall from the ship. He breasted the big waves, and swam toward it: it rose on the top of a wave, and he saw it was a life-buoy. Encumbered with wet clothes, he seemed impotent in the big waves; they threw him up so high, and down so low.

Almost exhausted, he got to the life-buoy, and clutched it with a fierce grasp and a wild cry of delight. He got it over his head, and placing his arms round the buoyant circle, stood with his breast and head out of water, gasping.

He now drew a long breath, and got his wet hair out of his eyes, already smarting with salt-water, and, raising himself on the buoy, looked out for help.

He saw, to his great concern, the ship already at a distance. She seemed to have flown, and she was still drifting fast away from him.

He saw no signs of help. His heart began to turn as cold as his drenched body. A horrible fear crossed him.

But presently he saw the weather-boat filled, and fall into the water; and then a wave rolled between him and the ship, and he only saw her topmast.

The next time he rose on a mighty wave he saw the boats together astern of the vessel: but not coming his way; and the gloom was thickening, the ship becoming indistinct, and all was doubt and horror.

A life of agony passed in a few minutes.

He rose and fell like a cork on the buoyant waves—rose and fell, and saw nothing but the ship's lights, now terribly distant.

But at last, as he rose and fell, he caught a few fitful glimpses of a smaller light rising and falling like himself. "A boat!" he cried, and, raising himself as high as he could, shouted, cried, implored for help. He stretched his hands across the water. "This way! this way!"

The light kept moving, but it came no nearer. They had greatly underrated the drift. The other boat had no light.

Minutes passed of suspense, hope, doubt, dismay, terror. Those minutes seemed hours.

In the agony of suspense the quaking heart sent beads of sweat to the brow, though the body was immersed.

And the gloom deepened, and the cold waves flung him up to heaven with their giant arms, and then down again to hell: and still that light, his only hope, was several hundred yards from him.

Only for a moment at a time could his eyeballs, straining with agony, catch this will-o'-the-wisp, the boat's light. It groped the sea up and down, but came no nearer.

When what seemed days of agony had passed, suddenly a rocket rose in the horizon—so it seemed to him.

The lost man gave a shriek of joy; so prone are we to interpret things hopefully.

Misery! The next time he saw that little light, that solitary spark of hope, it was not quite so near as before. A mortal sickness fell on his heart. The ship had recalled the boats by rocket.

He shrieked, he cried, he screamed, he raved. "Oh, Rosa! Rosa! for her sake, men, men, do not leave me. I am here! Here!"

In vain. The miserable man saw the boat's little light retire, recede, and melt into the ship's larger light, and that light glided away.

Then a cold, deadly stupor fell on him. Then Death's icy claw seized his heart, and seemed to run from it to every part of him. He was a dead man. Only a question of time. Nothing to gain by floating.

But the despairing mind could not quit the world in peace, and even here in the cold, cruel sea the quivering body clung to this fragment of life, and winced at death's touch, though more merciful.

He despised this weakness, he raged at it; he could not overcome it.

Unable to live or to die, condemned to float slowly, hour by hour, down into Death's jaws.

To a long, death-like stupor succeeded frenzy. Fury seized this great and long-suffering mind. It rose against the cruelty and injustice of his fate. He cursed the world, whose stupidity had driven him to sea; he cursed remorseless nature; and at last he railed on the God who made him, and made the cruel water that was waiting for his body. "God's justice! God's mercy! God's power! they are all lies," he shouted, "dreams, chimeras, like Him, the all-powerful and good, men babble of by the fire. If there was a God more powerful than the sea, and only half as good as men are, He would pity my poor Rosa and me, and send a hurricane to drive those caitiffs back to

the wretch they have abandoned. Nature alone is mighty. Oh, if I could have her on my side, and only God against me! But she is as deaf to prayer as He is: as mechanical and remorseless. I am a bubble melting into the sea. Soul I have none; my body will soon be nothing, nothing. So ends an honest, loving life. I always tried to love my fellow-creatures. Curse them! curse them! Curse the earth! Curse the sea! Curse all nature: there is no other God for me to curse."

The moon came out.

He raised his head and staring eyeballs, and cursed her.

The wind began to whistle, and flung spray in his face.

He raised his fallen head and staring eyeballs, and cursed the wind.

While he was thus raving he became sensible of a black object to windward.

It looked like a rail, and a man leaning on it.

He stared, he cleared the wet hair from his eyes, and stared again.

The thing, being larger than himself and partly out of water, was drifting to leeward faster than himself.

He stared and trembled, and at last it came nearly abreast, black, black.

He gave a loud cry, and tried to swim toward it; but, encumbered with his life-buoy, he made little progress. The thing drifted abreast of him, but ten yards distant.

As they each rose high upon the waves he saw it plainly.

It was the very raft that had been the innocent cause of his sad fate.

He shouted with hope, he swam, he struggled; he got near it, but not to it; it drifted past, and he lost his chance of intercepting it. He struggled after it. The life-buoy would not let him catch it.

Then he gave a cry of agony, rage, despair, and flung off the life-buoy, and risked all on this one chance.

He gains a little on the raft.

He loses.

He gains: he cries, "Rosa! Rosa!" and struggles with all his soul, as well as his body: he gains.

But, when almost within reach, a wave half drowns him, and he loses.

He cries, "Rosa! Rosa!" and swims high and strong. "Rosa! Rosa! Rosa!"

He is near it. He cries, "Rosa! Rosa!" and, with all the energy of love and life, flings himself almost out of the water, and catches hold of the nearest thing on the raft.

It was the dead man's leg.

It seemed as if it would come away in his grasp. He dared not try to pull himself up by that. But he held on by it, panting, exhausting, faint.

This faintness terrified him. "Oh," thought he, "if I faint now, all is over."

Holding by that terrible and strange support, he made a grasp, and caught hold of the wood-work at the bottom of the rail. He tried to draw himself up. Impossible.

He was no better off than with his life-buoy.

But in situations so dreadful men think fast; he worked gradually round the bottom of the raft by his hands, till he got to leeward, still holding on. There he found a solid block of wood at the edge of the raft. He prized himself carefully up: the raft in that part then sank a little: he got his knee upon the timber of the raft, and, with a wild cry, seized the nearest upright, and threw both arms round it and clung tight. Then first he found breath to speak. "THANK GOD!" he cried, kneeling on the timber, and grasping the upright post—"OH, THANK GOD! THANK GOD!"

CHAPTER XV.

"THANK GOD!" why, according to his theory, it should have been "Thank Nature." But I observe that, in such cases, even philosophers are ungrateful to the mistress they worship.

Our philosopher not only thanked God, but, being on his knees, prayed forgiveness for his late ravings, prayed hard, with one arm curled round the upright, lest the sea, which ever and anon rushed over the bottom of the raft, should swallow him up in a moment.

Then he rose carefully, and wedged himself into the corner of the raft opposite to that other figure, ominous relic of the wild voyage the new-comer had entered upon; he put both arms over the rail and stood erect.

The moon was now up; but so was the breeze: fleecy clouds flew with vast rapidity across her bright face, and it was by fitful though vivid glances Staines examined the raft and his companion.

The raft was large and well made of timbers tied and nailed together, and a strong rail ran round it resting on several uprights. There were also some blocks of a very light wood screwed to the horizontal timbers, and these made it float high.

But what arrested and fascinated the man's gaze was his dead companion, sole survivor, doubtless, of a horrible voyage, since the raft was not made for one, nor by one.

It was a skeleton, or nearly, whose clothes the sea-birds had torn, and pecked every limb in all the fleshy parts; the rest of the body had dried to dark leather on the bones. The head was little more than an eyeless skull: but, in the fitful moonlight, those huge hollow caverns seemed gigantic lamp-like eyes, and glared at him fiendishly, appallingly.

He sickened at the sight. He tried not to

look at it; but it would be looked at, and threaten him in the moonlight with great lack-lustre eyes.

The wind whistled, and lashed his face with spray torn off the big waves, and the water was nearly always up to his knees, and the raft tossed so wildly, it was all he could do to hold on in his corner; in which struggle still those monstrous lack-lustre eyes, like lamps of death, glared at him in the moon, and all else dark, except the fiery crests of the black mountain billows, tumbling and raging all around.

What a night!

But before morning the breeze sank, the moon set, and a sombre quiet succeeded, with only that grim figure in outline dimly visible. Owing to the motion still retained by the waves it seemed to nod and rear, and be ever preparing to rush upon him.

The sun rose glorious on a lovely scene, the sky was a very mosaic of colors sweet and vivid, and the tranquil, rippling sea, peach-colored to the horizon, with lines of diamonds where the myriad ripples broke into smiles.

Staines was asleep, exhausted. Soon the light awoke him, and he looked up. What an incongruous picture met his eye: that heaven of color all above and around, and right before him, like a devil stuck in mid-heaven, that grinning corpse, whose fate foreshadowed his own.

But daylight is a great strengthener of the nerves; the figure no longer appalled him—a man who had long learned to look with science's calm eye upon the dead. When the sea became like glass, and from peach-color deepened to rose, he walked along the raft, and inspected the dead man. He found it was a man of color, but not a black. The body was not kept in its place, as he had supposed, merely by being jammed into the angle caused by the rail; it was also lashed to the corner upright by a long, stout belt. Staines concluded this had kept the body there, and its companions had been swept away.

This was not lost on him: he removed the belt for his own use; he then found it was not only a belt, but a receptacle; it was nearly full of small hard substances that felt like stones.

When he had taken it off the body he felt a compunction. "Ought he to rob the dead, and expose it to be swept into the sea at the first wave, like a dead dog?"

He was about to replace the belt, when a middle course occurred to him. He was a man who always carried certain useful little things about him, viz., needles, thread, scissors, and string. He took a piece of string, and easily secured this poor light skeleton to the raft. The belt he strapped to the rail, and kept for his own need.

And now hunger gnawed him. No food was near. There was nothing but the lovely sea and sky, mosaic with color, and that grim, ominous skeleton.

Hunger comes and goes many times before it becomes insupportable. All that day and night, and the next day, he suffered its pangs; and then it became torture, but the thirst maddening.

Toward night fell a gentle rain. He spread a handkerchief and caught it. He sucked the handkerchief.

This revived him, and even allayed in some degree the pangs of hunger.

Next day was cloudless. A hot sun glared on his unprotected head, and battered down his enfeebled frame.

He resisted as well as he could. He often dipped his head, and as often the persistent sun, with cruel glare, made it smoke again.

Next day the same: but the strength to meet it was waning. He lay down and thought of Rosa, and wept bitterly. He took the dead man's belt, and lashed himself to the upright. That act, and his tears for his beloved, were almost his last acts of perfect reason: for next day came the delusions and the dreams that succeed when hunger ceases to torture, and the vital powers begin to ebb. He lay and saw pleasant meadows, with meandering streams, and clusters of rich fruit, that courted the hand and melted in the mouth.

Ever and anon they vanished, and he saw grim death looking down on him with those big cavernous eyes.

By-and-by, whether his body's eye saw the grim skeleton, or his mind's eye the juicy fruits, green meadows, and pearly brooks, all was shadowy.

So, in a placid calm, beneath a blue sky, the raft drifted dead, with its dead freight, upon the glassy purple, and he drifted too toward the world unknown.

There came across the waters to that dismal raft a thing none too common by sea or land—a good man.

He was tall, stalwart, bronzed, and had hair like snow, before his time; for he had known trouble. He commanded a merchant steamer, bound for Calcutta, on the old route.

The man at the mast-head descried a floating wreck, and hailed the deck accordingly. The captain altered his course without one moment's hesitation, and brought up alongside, lowered a boat, and brought the dead and the breathing man on board.

A young middy lifted Staines in his arms from the wreck to the boat: he whose person I described in Chapter I. weighed now no more than that.

Men are not always rougher than women. Their strength and nerve enable them now and then to be gentler than butter-fingered angels, who drop frail things through sensitive agitation and break them. These rough

men saw Staines was hovering between life and death, and they handled him like a thing the ebbing life might be shaken out of in a moment. It was pretty to see how gingerly the sailors carried the sinking man up the ladder, and one fetched swabs, and the others laid him down softly on them at their captain's feet.

"Well done, men," said he. "Poor fellow! Pray Heaven we may not have come too late. Now stand aloof a bit. Send the surgeon aft."

The surgeon came, and looked and felt the heart. He shook his head, and called for brandy. He had Staines's head raised, and got half a spoonful of diluted brandy down his throat. But there was an ominous gurgling.

After several such attempts at intervals he said plainly the man's life could not be saved by ordinary means.

"Then try extraordinary," said the captain. "My orders are that he is to be saved. There is life in him. You have only got to keep it there. He *must* be saved; he *shall* be saved."

"I should like to try Dr. Staines's remedy," said the surgeon.

"Try it, then: what is it?"

"A bath of beef tea. Dr. Staines says he applied it to a starved child—in the *Lancet*."

"Take a hundred-weight of beef, and boil it in the coppers."

Thus encouraged, the surgeon went to the cook, and very soon beef was steaming on a scale and at a rate unparalleled.

Meantime Captain Dodd had the patient taken to his own cabin, and he and his servant administered weak brandy-and-water with great caution and skill.

There was no perceptible result. But, at all events, there was life and vital instinct left, or he could not have swallowed.

Thus they hovered about him for some hours, and then the bath was ready.

The captain took charge of the patient's clothes; the surgeon and a sailor bathed him in lukewarm beef tea, and then covered him very warm with blankets next the skin. Guess how near a thing it seemed to them when I tell you they dared not rub him.

Just before sunset his pulse became perceptible. The surgeon administered half a spoonful of egg-flip. The patient swallowed it.

By-and-by he sighed.

"He must not be left, day or night," said the captain. "I don't know who or what he is, but he is a man; and I could not bear him to die now."

That night Captain Dodd overhauled the patient's clothes, and looked for marks on his linen. There were none.

"Poor devil!" said Captain Dodd. "He is a bachelor."

Captain Dodd found his pocket-book, with bank-notes £200. He took the numbers, made a memorandum of them, and locked the notes up.

He lighted his lamp, examined the belt, unripped it, and poured out the contents on his table.

They were dazzling. A great many large pieces of amethyst, and some of white topaz and rock-crystal; a large number of smaller stones, carbuncles, chrysolites, and not a few emeralds. Dodd looked at them with pleasure, sparkling in the lamp-light.

"What a lot!" said he. "I wonder what they are worth?" He sent for the first mate, who, he knew, did a little private business in precious stones. "Masterton," said he, "oblige me by counting these stones with me, and valuing them."

Mr. Masterton stared, and his mouth watered. However, he named the various stones and valued them. He said there was only one stone, a large emerald without a flaw, that was worth a heavy sum by itself; but the pearls, very fine; and, looking at the great number, they must be worth a thousand pounds.

Captain Dodd then entered the whole business carefully in the ship's log: the living man he described thus, "About five feet six in height, and about fifty years of age." Then he described the notes and the stones very exactly, and made Masterton, the valuer, sign the log.

Staines took a good deal of egg-flip that night, and next day ate solid food; but they questioned him in vain; his reason was entirely in abeyance: he had become an eater, and nothing else. Whenever they gave him food he showed a sort of fawning, animal gratitude. Other sentiment he had none, nor did words enter his mind any more than a bird's. And, since it is not pleasant to dwell on the wreck of a fine understanding, I will only say that they landed him at Cape Town, out of bodily danger, but weak, and his mind, to all appearance, a hopeless blank.

They buried the skeleton, read the service of the English Church over a Malabar heathen.

Dodd took Staines to the hospital, and left twenty pounds with the governor of it to cure him. But he deposited Staines's money and jewels with a friendly banker, and begged that the principal cashier might see the man, and be able to recognize him should he apply for his own.

The cashier came and examined him, and also the ruby ring on his finger—a parting gift from Rosa—and remarked this was a new way of doing business.

"Why, it is the only one, Sir," said Dodd. "How can we give you his signature? He is not in his right mind."

"Nor never will be."

"Don't say that, Sir. Let us hope for the best, poor fellow."

Having made these provisions, the worthy captain weighed anchor, with a warm heart and a good conscience. Yet the image of the man he had saved pursued him, and he resolved to look after him next time he should coal at Cape Town, homeward bound.

Staines recovered his strength in about two months; but his mind returned in fragments, and very slowly. For a long, long time he remembered nothing that had preceded his great calamity. His mind started afresh, aided only by certain fixed habits; for instance, he could read and write; but, strange as it may appear, he had no idea who he was; and when his memory cleared a little on that head he thought his surname was Christie, but he was not sure.

Nevertheless, the presiding physician discovered in him a certain progress of intelligence, which gave him great hopes. In the fifth month, having shown a marked interest in the other sick patients, coupled with a disposition to be careful and attentive, they made him a nurse, or rather a sub-nurse under the special orders of a responsible nurse. I really believe it was done at first to avoid the alternative of sending him adrift or transferring him to the insane ward of the hospital. In this congenial pursuit he showed such watchfulness and skill that by-and-by they found they had got a treasure. Two months after that he began to talk about medicine, and astonished them still more. He became the puzzle of the establishment. The doctor and surgeon would converse with him, and try and lead him to his past life; but when it came to that he used to put his hands to his head, with a face of great distress, and it was clear some impassable barrier lay between his growing intelligence and the past events of his life. Indeed, on one occasion, he said to his kind friend the doctor, "The past!—a black wall! a black wall!"

Ten months after his admission he was promoted to be an attendant, with a salary.

He put by every shilling of it; for he said, "A voice from the dark past tells me money is every thing in this world."

A discussion was held by the authorities as to whether he should be informed he had money and jewels at the bank or not.

Upon the whole, it was thought advisable to postpone this information, lest he should throw it away; but they told him he had been picked up at sea, and both money and jewels found on him; they were in safe hands; only the person was away for the time. Still he was not to look upon himself as either friendless or moneyless.

At this communication he showed an almost childish delight, that confirmed the doctor in his opinion he was acting prudently, and for the real benefit of an amiable and afflicted person, not yet to be trusted with money and jewels.

CHAPTER XVI.

In his quality of attendant on the sick, Staines sometimes conducted a weak but convalescent patient into the open air, and he was always pleased to do this, for the air of the Cape carries health and vigor on its wings. He had seen its fine recreative properties, and he divined, somehow, that the minds of convalescents ought to be amused; and so he often begged the doctor to let him take a convalescent abroad. Sooner than not, he would draw the patient several miles in a Bath chair. He rather liked this, for he was a Hercules, and had no egotism or false pride where the sick were concerned.

Now these open-air walks exerted a beneficial influence on his own darkened mind. It is one thing to struggle from idea to idea; it is another when material objects mingle with the retrospect; they seem to supply stepping-stones in the gradual resuscitation of memory and reason.

The ships going out of port were such a stepping-stone to him, and a vague consciousness came back to him of having been in a ship.

Unfortunately, along with this reminiscence came a desire to go in one again, and this sowed discontent in his mind; and the more that mind enlarged, the more he began to dislike the hospital and its confinement. The feeling grew, and bade fair to disqualify him for his humble office. The authorities could not fail to hear of this, and they had a little discussion about parting with him; but they hesitated to turn him adrift, and they still doubted the propriety of trusting him with money and jewels.

While matters were in this state, a remarkable event occurred. He drew a sick patient down to the quay one morning, and watched the business of the port with the keenest interest. A ship at anchor was unloading, and a great heavy boat was sticking to her side like a black leech. Presently this boat came away, and moved sluggishly toward the shore, rather by help of the tide than of the two men who went through the form of propelling her with two monstrous sweeps, while a third steered her. She contained English goods: agricultural implements, some cases, four horses, and a buxom young woman with a thorough English face. The woman seemed a little excited, and as she neared the landing-place she called out, in jocund tones, to a young man on the shore, "It is all right, Dick; they are beauties;" and she patted the beasts as people do who are fond of them.

She stepped lightly ashore; and then came the slower work of landing her imports. She bustled about, like a hen over her brood, and wasn't always talking, but put in her word every now and then, never crossly, and always to the point.

Staines listened to her, and examined her with a sort of puzzled look; but she took no notice of him; her whole soul was in the cattle.

They got the things on board well enough; but the horses were frightened at the gangway, and jibbed. Then a man was for driving them, and poked one of them in the quarter; he snorted and reared directly.

"Man alive!" cried the young woman, "that is not the way. They are docile enough, but frightened. Encourage 'em, and let 'em look at it. Give 'em time. More haste less speed, with timorsome cattle."

"That is a very pleasant voice," said poor Staines, rather more dictatorially than became the present state of his intellect. He added, softly, "A true woman's voice;" then gloomily, "a voice of the past—the dark, dark past."

At this speech intruding itself upon the short sentences of business, there was a roar of laughter; and Phœbe Falcon turned sharply round to look at the speaker. She stared at him; she cried "Oh!" and clasped her hands, and colored all over. "Why, sure," said she, "I can't be mistook. Those eyes—'tis you, Doctor, isn't it?"

"Doctor!" said Staines, with a puzzled look. "Yes: I think they called me doctor once. I'm an attendant in the hospital now."

"Dick!" cried Phœbe, in no little agitation. "Come here this minute."

"What, afore I get the horses ashore?"

"Ay, before you do another thing, or say another word. Come here, now." So he came, and she told him to take a good look at the man. "Now," said she, "who is that?"

"Blest if I know," said he.

"What, not know the man that saved your own life! Oh, Dick, what are your eyes worth?"

This discourse brought the few persons within hearing into one band of excited starers.

Dick took a good look, and said, "I'm blest if I don't, though; it is the doctor that cut my throat."

This strange statement drew forth quite a shout of ejaculations.

"Oh, better breathe through a slit than not at all," said Dick. "Saved my life with that cut, he did—didn't he, Pheeb?"

"That he did, Dick. Dear heart, I hardly know whether I am in my senses or not, seeing him a-looking so blank. You try him."

Dick came forward. "Sure you remember me, Sir. Dick Dale. You cut my throat, and saved my life."

"Cut your throat! why, that would kill you."

"Not the way you done it. Well, Sir, you ain't the man you was, that is clear: but you was a good friend to me, and there's my hand."

"Thank you, Dick," said Staines, and took his hand. "I don't remember *you*. Perhaps you are one of the past. The past is a dead-wall to me—a dark dead-wall;" and he put his hands to his head with a look of distress.

Every body there now suspected the truth, and some pointed mysteriously to their own heads.

Phœbe whispered an inquiry to the sick person.

He said, a little pettishly, "All I know is, he is the kindest attendant in the ward, and very attentive."

"Oh, then, he is in the public hospital."

"Of course he is."

The invalid, with the selfishness of his class, then begged Staines to take him out of all this bustle down to the beach. Staines complied at once, with the utmost meekness, and said, "Good-by, old friends; forgive me for not remembering you. It is my great affliction that the past is gone from me—gone, gone." And he went sadly away, drawing his sick charge like a patient mule.

Phœbe Falcon looked after him, and began to cry.

"Nay, nay, Phœbe," said Dick; "don't ye take on about it."

"I wonder at you," sobbed Phœbe. "Good people, I'm fonder of my brother than he is of himself, it seems; for I can't take it so easy. Well, the world is full of trouble. Let us do what we are here for. But I shall pray for the poor soul every night, that his mind may be given back to him."

So then she bustled, and gave herself to getting the cattle on shore, and the things put on board her wagon.

But, when this was done, she said to her brother, "Dick, I did not think any thing on earth could take my heart off the cattle and the things we have got from home; but I can't leave this without going to the hospital about our poor dear doctor; and it is late for making a start, any way—and you mustn't forget the newspapers for Reginald, he is so fond of them—and you must contrive to have one sent out regular after this, and I'll go to the hospital."

She went, and saw the head doctor, and told him he had got an attendant there she had known in England in a very different condition, and she had come to see if there was any thing she could do for him—for she felt very grateful to him, and grieved to see him so.

The doctor was pleased and surprised, and put several questions.

Then she gave him a clear statement of what he had done for Dick in England.

"Well," said the doctor, "I believe it is the same man; for, now you tell me this—yes, one of the nurses told me he knew more

medicine than she did. His name, if you please."

"His name, Sir?"

"Yes, his name. Of course you know his name. Is it Christie?"

"Doctor," said Phœbe, blushing, "I don't know what you will think of me, but I don't know his name. Laws forgive me, I never had the sense to ask it."

A shade of suspicion crossed the doctor's face.

Phœbe saw it, and colored to the temples. "Oh, Sir," she cried, piteously, "don't go for to think I have told you a lie! why should I? and indeed I am not of that sort, nor Dick neither. Sir, I'll bring him to you, and he will say the same. Well, we were all in terror and confusion, and I met him accidentally in the street. He was only a customer till then, and paid ready money, so that is how I never knew his name; but if I hadn't been the greatest fool in England, I should have asked his wife."

"What! he has a wife?"

"Ay, Sir, the loveliest lady you ever clapped eyes on, and he is almost as handsome; has eyes in his head like jewels; 'twas by them I knew him on the quay, and I think he knew my voice again—said as good as he had heard it in past times."

"Did he? Then we have got him," cried the doctor, energetically.

"La, Sir."

"Yes; if he knows your voice, you will be able in time to lead his memory back; at least, I think so. Do you live in Cape Town?"

"Dear heart, no. I live at my own farm, a hundred and eighty miles from this."

"What a pity!"

"Why, Sir?"

"Well—hum!"

"Oh, if you think I could do the poor doctor good by having him with me, you have only to say the word, and out he goes with Dick and me to-morrow morning. We should have started for home to-night but for this."

"Are you in earnest, madam?" said the doctor, opening his eyes. "Would you really encumber yourself with a person whose reason is in suspense, and may never return?"

"But that is not his fault, Sir. Why, if a dog had saved my brother's life, I'd take it home, and keep it all its days: and this is a man, and a worthy man. Oh, Sir, when I saw him brought down so, and his beautiful eyes clouded like, my very bosom yearned over the poor soul: a kind act done in dear old England, who could see the man in trouble here and not repay it—ay, if it cost one's blood. But, indeed, he is strong and healthy, and hands always scarce our way, and the odds are he will earn his meat one way or t'other; and if he doesn't, why, all the better for me; I shall have the pleasure of serving him for naught that once served me for neither money nor reward."

"You are a good woman," said the doctor, warmly.

"There's better, and there's worse," said Phœbe, quietly, and even a little coldly.

"More of the latter," said the doctor, dryly. "Well, Mrs.—"

"Falcon, Sir."

"We shall hand him over to your care; but first—just for form—if you are a married woman, we should like to see Dick here: he is your husband, I presume."

Phœbe laughed merrily. "Dick is my brother; and he can't be spared to come here. Dick! he'd say black was white, if I told him to."

"Then let us see your husband about it—just for form."

"My husband is at the farm. I could not venture so far away, and not leave him in charge." If she had said, "I will not bring him into temptation," that would have been nearer the truth. "Let that fly stick on the wall, Sir. What I do my husband will approve."

"I see how it is. You rule the roost."

Phœbe did not reply point-blank to that; she merely said, "All my chickens are happy, great and small," and an expression of lofty, womanly, innocent pride illuminated her face and made it superb for a moment.

In short, it was settled that Staines should accompany her next morning to Dale's Kloof Farm, if he chose. On inquiry, it appeared that he had just returned to the hospital with his patient. He was sent for, and Phœbe asked him sweetly if he would go with her to her house, one hundred and eighty miles away, and she would be kind to him.

"On the water?"

"Nay, by land; but 'tis a fine country, and you will see beautiful deer and things running across the plains, and—"

"Shall I find the past again, the past again?"

"Ay, poor soul, that we shall, God willing. You and I, we will hunt it together."

He looked at her, and gave her his hand. "I will go with you. Your face belongs to the past, so does your voice."

He then inquired, rather abruptly, had she any children. She smiled.

"Ay, that I have, the loveliest little boy you ever saw. When you are as you used to be, you will be his doctor, won't you?"

"Yes, I will nurse him, and you will help me find the Past."

Phœbe then begged Staines to be ready to start at six in the morning. She and Dick would take him up on their way.

While she was talking to him the doctor slipped out, and, to tell the truth, he went to consult with another authority whether he should take this opportunity of telling Staines that he had money and jewels at the bank: he himself was half inclined to do so;

but the other, who had not seen Phœbe's face, advised him to do nothing of the kind. "They are always short of money, these colonial farmers," said he; "she would get every shilling out of him."

"Most would; but this is such an honest face."

"Well, but she is a mother, you say."

"Yes."

"Well, what mother could be just to a lunatic, with her own sweet angel babes to provide for?"

"That is true," said Dr. ——. "Maternal love is apt to modify the conscience."

"What I would do, I would take her address, and make her promise to write if he gets well; and, if he does get well, then write to *him*, and tell him all about it."

Dr. —— acted on this shrewd advice, and ordered a bundle to be made up for the traveler out of the hospital stores: it contained a nice light summer suit and two changes of linen.

CHAPTER XVII.

NEXT morning Staines and Dick Dale walked through the streets of Cape Town side by side. Dick felt the uneasiness of a sane man, not familiar with the mentally afflicted, who suddenly finds himself alone with one. Insanity turns men oftenest into sheep and hares; but it does now and then make them wolves and tigers; and that has saddled the insane in general with a character for ferocity. Young Dale, then, cast many a suspicious glance at his comrade, as he took him along. These glances were reassuring: Christopher's face had no longer the mobility, the expressive changes, that mark the superior mind; his countenance was monotonous: but the one expression was engaging; there was a sweet, patient, lamb-like look: the glorious eye a little troubled and perplexed, but wonderfully mild. Dick Dale looked and looked, and his uneasiness vanished. And the more he looked the more did a certain wonder creep over him, and make him scarce believe the thing he knew, viz., that a learned doctor had saved him from the jaws of death by rare knowledge, sagacity, courage, and skill combined; and that mighty man of wisdom was brought down to this lamb, and would go north, south, east, or west with sweet and perfect submission, even as he, Dick Dale, should appoint. With these reflections honest Dick felt his eyes get a little misty, and, to use those words of Scripture which nothing can surpass or equal, his bowels yearned over the man.

As for Christopher, he looked straight forward, and said not a word till they cleared the town; but, when he saw the vast flowery vale, and the far-off violet hills, like Scotland glorified, he turned to Dick with an ineffable expression of sweetness and good-fellowship, and said, "Oh, beautiful!—We'll hunt the Past together."

"We—will—*so*," said Dick, with a sturdy and, indeed, almost a stern resolution.

Now this he said, not that he cared for the Past, nor intended to waste the Present by going upon its predecessor's trail; but he had come to a resolution—full three minutes ago—to humor his companion to the top of his bent, and say "Yes" with hypocritical vigor to every thing not directly and immediately destructive to him and his.

The next moment they turned a corner and came upon the rest of their party, hitherto hidden by the apricot hedge and a turning in the road. A blue-black Kafir, with two yellow Hottentot drivers, man and boy, was harnessing, in the most primitive mode, four horses on to the six oxen attached to the wagon; and the horses were flattening their ears, and otherwise resenting the incongruity. Meantime a fourth figure, a colossal young Kafir woman, looked on superior with folded arms, like a sable Juno, looking down with that absolute composure upon the struggles of man and other animals which Lucretius and his master Epicurus assigned to the divine nature. Without jesting, the grandeur, majesty, and repose of this figure were unsurpassable in nature, and such as have vanished from sculpture two thousand years and more.

Dick Dale joined the group immediately, and soon arranged the matter. Meantime Phœbe descended from the wagon, and welcomed Christopher very kindly, and asked him if he would like to sit beside her, or to walk.

He glanced into the wagon; it was covered and curtained, and dark as a cupboard. "I think," said he, timidly, "I shall see more of the Past out here."

"So you will, poor soul," said Phœbe, kindly, "and better for your health: but you must not go far from the wagon, for I'm a Fidget; and I have got the care of you now, you know, for want of a better. Come, Ucatella; you must ride with me, and help me sort the things; they are all higgledy-piggledy." So those two got into the wagon through the back curtains. Then the Kafir driver flourished his kambok, or long whip, in the air, and made it crack like a pistol, and the horses reared, and the oxen started and slowly bored in between them, for they whinnied, and kicked, and spread out like a fan all over the road; but a flick or two from the terrible kambok soon sent them bleeding and trembling and rubbing shoulders, and the oxen mildly but persistently goring their recalcitrating haunches, the intelligent animals went ahead, and revenged themselves by breaking the harness. But that goes for little in Cape travel.

The body of the wagon was long and low

and very stout. The tilt strong and tight made. The roof inside, and most of the sides, lined with green baize. Curtains of the same to the little window and the back. There was a sort of hold literally built full of purchases; a small fire-proof safe; huge blocks of salt; saws, axes, pickaxes, adzes, flails, tools innumerable, bales of wool and linen stuff, hams, and two hundred empty sacks strewn over all. In large pigeon-holes fixed to the sides were light goods, groceries, collars, glaring cotton handkerchiefs for Phœbe's aboriginal domestics, since not every year did she go to Cape Town, a twenty days' journey by wagon: things dangled from the very roof; but no hard goods there, if you please, to batter one's head in a spill. Outside were latticed grooves with tent, tent-poles, and rifles. Great pieces of cork and bags of hay and corn hung dangling from mighty hooks—the latter to feed the cattle, should they be compelled to camp out on some sterile spot in the Veldt, and, methinks, to act as buffers, should the whole concern roll down a nullah or little precipice—no very uncommon incident in the blessed region they must pass to reach Dale's Kloof.

Harness mended; fresh start. The Hottentots and Kafir vociferated and yelled, and made the unearthly row of a dozen wild beasts wrangling: the horses drew the bullocks, they the wagon; it crawled and creaked, and its appendages wobbled finely.

Slowly they creaked and wobbled past apricot hedges and detached houses and huts, and got into an open country without a tree, but here and there a stunted camel-thorn. The soil was arid, and grew little food for man or beast; yet, by a singular freak of nature, it put forth abundantly things that here at home we find it harder to raise than homely grass and oats; the ground was thickly clad with flowers of delightful hues; pyramids of snow or rose-color bordered the track; yellow and crimson stars bejeweled the ground, and a thousand bulbous plants burst into all imaginable colors, and spread a rainbow carpet to the foot of the violet hills; and all this glowed and gleamed and glittered in a sun shining with incredible brightness and purity of light, but, somehow, without giving a headache or making the air sultry.

Christopher fell to gathering flowers, and interrogating the Past by means of them; for he had studied botany. The Past gave him back some pitiably vague ideas. He sighed. "Never mind," said he to Dick, and tapped his forehead; "it is here: it is only locked up."

"All right," said Dick; "nothing is lost when you know where 'tis."

"This is a beautiful country," suggested Christopher. "It is all flowers. It is like the garden of—the garden of— Locked up."

"It is de—light—ful," replied the self-compelled optimist, sturdily. But here nature gave way; he was obliged to relieve his agricultural bile by getting into the cart and complaining to his sister. "'Twill take us all our time to cure him. He have been bepraising this here soil, which it is only fit to clean the women's kettles. 'Twouldn't feed three larks to an acre, I know; no, *nor half so many.*"

"Poor soul! mayhap the flowers have took his eye. Sit here a bit, Dick. I want to talk to you about a many things."

While these two were conversing, Ucatella, who was very fond of Phœbe, but abhorred wagons, stepped out and stalked by the side, like an ostrich, a camelopard, or a Taglioni; nor did the effort with which she subdued her stride to the pace of the procession appear: it was the poetry of walking. Christopher admired it a moment; but the noble expanse tempted him, and he strode forth like a giant, his lungs inflating in the glorious air, and soon left the wagon far behind.

The consequence was that when they came to a halt, and Dick and Phœbe got out to release and water the cattle, there was Christopher's figure retiring into space.

"Hanc rem ægrè tulit Phœbe," as my old friend Livy would say. "Oh dear! oh dear! if he strays so far from us he will be eaten up at night-fall by jackals, or lions, or something. One of you must go after him."

"Me go, missy," said Ucatella, zealously, pleased with an excuse for stretching her magnificent limbs.

"Ay, but mayhap he will not come back with *you:* will he, Dick?"

"That he will, like a lamb." Dick wanted to look after the cattle.

"Yuke, my girl," said Phœbe, "listen. He has been a good friend of ours in trouble; and now he is not quite right *here.* So be very kind to him, but be sure and bring him back, or keep him till we come."

"Me bring him back alive, certain sure," said Ucatella, smiling from ear to ear. She started with a sudden glide, like a boat taking the water, and appeared almost to saunter away, so easy was the motion; but when you looked at the ground she was covering, the stride, or glide, or whatever it was, was amazing—

"She seemed in walking to devour the way."

Christopher walked fast, but nothing like this; and as he stopped at times to botanize and gaze at the violet hills, and interrogate the Past, she came up with him about five miles from the halting-place.

She laid her hand quietly on his shoulder, and said, with a broad genial smile and a musical chuckle, "Ucatella come for you. Missy want to speak you."

"Oh! very well;" and he turned back

with her directly; but she took him by the hand to make sure; and they marched back peaceably, in silence, and hand in hand. But he looked and looked at her, and at last he stopped dead short, and said, a little arrogantly, "Come! I know *you*. *You* are not locked up:" and he inspected her point-blank. She stood like an antique statue, and faced the examination. "You are 'the noble savage,'" said he, having concluded his inspection.

"Nay," said she. "I be the house-maid."

"The house-maid!"

"Iss, the house-maid, Ucatella. So come on." And she drew him along, sore perplexed.

They met the cavalcade a mile from the halting-place, and Phœbe apologized a little to Christopher. "I hope you'll excuse me, Sir," said she; "but I am just for all the world like a hen with her chickens; if but one strays, I'm all in a flutter till I get him back."

"Madam," said Christopher, "I am very unhappy at the way things are locked up. Please tell me truly is this 'the house-maid,' or the 'noble savage?'"

"Well, she is both, if you go to that, and the best creature ever breathed."

"Then she *is* the 'noble savage.'"

"Ay, so they call her, because she is black."

"Then, thank Heaven," said Christopher, "the Past is not all locked up."

That afternoon they stopped at an inn. But Dick slept in the cart. At three in the morning they took the road again, and creaked along supernaturally loud under a purple firmament studded with huge stars, all bright as moons, that lit the way quite clear, and showed black things innumerable flitting to and fro; these made Phœbe shudder, but were no doubt harmless; still Dick carried his double rifle, and a revolver in his belt.

They made a fine march in the cool, until some slight mists gathered, and then they halted and breakfasted near a silvery kloof, and watered the cattle. While thus employed, suddenly a golden tinge seemed to fall like a lash on the vapors of night; they scudded away directly, as jackals before the lion; the stars paled, and with one incredible bound the mighty sun leaped into the horizon, and rose into the sky. In a moment all the lesser lamps of heaven were out, though late so glorious, and there was nothing but one vast vaulted turquois, and a great flaming topaz mounting with eternal ardor to its centre.

This did not escape Christopher. "What is this?" said he. "No twilight. The tropics!" He managed to dig that word out of the past in a moment.

At ten o'clock the sun was so hot that they halted, and let the oxen loose till sundown. Then they began to climb the mountains.

The way was steep and rugged; indeed, so rough in places that the cattle had to jump over the holes, and, as the wagon could not jump so cleverly, it jolted appallingly, and many a scream issued forth.

Near the summit, when the poor beasts were dead beat, they got into clouds and storms, and the wind rushed howling at them through the narrow pass with such fury, it flattened the horses' ears, and bade fair to sweep the whole cavalcade to the plains below.

Christopher and Dick walked close behind, under the lee of the wagon. Christopher said in Dick's ear, "D'ye hear that? Time to reef top-sails, captain."

"It is time to do *something*," said Dick. He took advantage of a jutting rock, drew the wagon half behind it and across the road, propped the wheels with stones, and they all huddled to leeward, man and beast indiscriminately.

"Ah!" said Christopher, approvingly, "we are lying to: a very—proper—course."

They huddled and shivered three hours, and then the sun leaped into the sky, and lo! a transformation scene. The cold clouds were first rosy fleeces, then golden ones, then gold-dust, then gone: the rain was big diamonds, then crystal sparks, then gone: the rocks and the bushes sparkled with gem-like drops, and shone and smiled.

The shivering party bustled and toasted the potent luminary in hot coffee; for Phœbe's wagon had a stove and chimney; and then they yoked their miscellaneous cattle again, and breasted the hill. With many a jump and bump and jolt, and scream from inside, they reached the summit, and looked down on a vast slope flowering but arid, a region of gaudy sterility.

The descent was more tremendous than the ascent, and Phœbe got out, and told Christopher she would liever cross the ocean twice than this dreadful mountain once.

The Hottentot with the reins was now bent like a bow all the time, keeping the cattle from flowing diverse over precipices, and the Kafir with his kambok was here and there and every where, his whip flicking like a lancet, and cracking like a horse-pistol, and the pair vied like Apollo and Pan, not which could sing sweetest, but swear loudest. Having the lofty hill for some hours between them and the sun, they bumped and jolted, and stuck in mud-holes, and flogged and swore the cattle out of them again, till at last they got to the bottom, where ran a turbid kloof, or stream. It was fordable, but the recent rains had licked away the slope; so the existing bank was two feet above the stream. Little recked the demon drivers or the parched cattle; in they plunged promiscuously, with a flop like thunder, follow-

ed by an awful splashing. The wagon stuck fast in the mud, the horses tied themselves in a knot, and rolled about in the stream, and the oxen drank, imperturbable.

"Oh, the salt! the salt!" screamed Phœbe, and the rocks re-echoed her lamentations.

The wagon was inextricable, the cattle done up, the savages lazy: so they staid for several hours. Christopher botanized; but not alone. Phœbe drew Ucatella apart, and explained to her that when a man is a little wrong in the head, it makes a child of him. "So," said she, "you must think he is your child, and never let him out of your sight."

"All right," said the sable Juno, who spoke English ridiculously well, and rapped out idioms, especially "Come on," and "All right."

About dusk, what the drivers had foreseen, though they had not the sense to explain it, took place; the kloof dwindled to a mere gutter, and the wagon stuck high and dry. Phœbe waved her handkerchief to Ucatella. Ucatella, who had dogged Christopher about four hours without a word, now took his hand, and said, "My child, missy wants us; come on;" and so led him unresistingly.

The drivers, flogging like devils, cursing like troopers, and yelling like hyenas gone mad, tried to get the wagon off; but it was fast as a rock. Then Dick and the Hottentot put their shoulders to one wheel, and tried to prize it up, while the Kafir *encouraged* the cattle with his thong. Observing this, Christopher went in, with his sable custodian at his heels, and heaved at the other imbedded wheel. The wagon was lifted directly, so that the cattle tugged it out, and they got clear. On examination, the salt had just escaped.

Says Ucatella to Phœbe, a little ostentatiously, "My child is strong and useful; make little missy a good slave."

"A slave! Heaven forbid!" said Phœbe. "He'll be a father to us all, once he gets his head back: and I do think it is coming—but very slow."

The next three days offered the ordinary incidents of African travel, but nothing that operated much on Christopher's mind, which is the true point of this narrative; and, as there are many admirable books of African travel, it is the more proper I should confine myself to what may be called the relevant incidents of the journey.

On the sixth day from Cape Town they came up with a large wagon stuck in a mud-hole. There was quite a party of Boers, Hottentots, Kafirs, round it, armed with whips, kamboks, and oaths, lashing and cursing without intermission, or any good effect; and there were the wretched beasts straining in vain at their choking yokes, moaning with anguish, trembling with terror, their poor mild eyes dilated with agony and fear, and often, when the blows of the cruel kamboks cut open their bleeding flesh, they bellowed to Heaven their miserable and vain protest against this devil's work.

Then the Past opened its stores, and lent Christopher a word.

"BARBARIANS!" he roared, and seized a gigantic Kafir by the throat, just as his kambok descended for the hundredth time. There was a mighty struggle, as of two Titans; dust flew round the combatants in a cloud; a whirling of big bodies, and down they both went with an awful thud, the Saxon uppermost, by Nature's law.

The Kafir's companions, amazed at first, began to roll their eyes and draw a knife or two, but Dick ran forward, and said, "Don't hurt him: he is wrong *here*."

This representation pacified them more readily than one might have expected. Dick added, hastily, "We'll get you out of the hole *our* way, and cry quits."

The proposal was favorably received, and the next minute Christopher and Ucatella at one wheel, and Dick and the Hottentot at the other, with no other help than two pointed iron bars bought for their shepherds, had effected what sixteen oxen could not. To do this Dick Dale had bared his arm to the shoulder; it was a stalwart limb, like his sister's, and he now held it out all swollen and corded, and slapped it with his other hand. "Look'ee here, you chaps," said he: "the worst use a man can put that there to is to go cutting out a poor beast's heart for not doing more than he can. You are good fellows, you Kafirs; but I think you have sworn never to put your shoulder to a wheel. But, bless your poor silly hearts, a little strength put on at the right place is better than a deal at the wrong."

"You hear that, you Kafir chaps?" inquired Ucatella, a little arrogantly—for a Kafir.

The Kafirs, who had stood quite silent to imbibe these remarks, bowed their heads with all the dignity and politeness of Roman senators, Spanish grandees, etc.; and one of the said party replied, gravely, "The words of the white man are always wise."

"And his arm blanked* strong," said Christopher's late opponent, from whose mind, however, all resentment had vanished.

Thus spake the Kafirs, yet to this day never hath a man of all their tribe put his shoulder to a wheel, so strong is custom in South Africa; probably in all Africa; since I remember St. Augustin found it stronger than he liked, at Carthage.

Ucatella went to Phœbe, and said, "Missy, my child is good and brave."

"Bother you and your child!" said poor Phœbe. "To think of his flying at a giant

* I take this very useful expression from a delightful volume by Mr. Boyle.

like that, and you letting of him. I'm all of a tremble from head to foot;" and Phœbe relieved herself with a cry.

"Oh, missy!" said Ucatella.

"There, never mind me. Do go and look after your child, and keep him out of more mischief. I wish we were safe at Dale's Kloof, I do."

Ucatella complied, and went botanizing with Dr. Staines; but that gentleman, in the course of his scientific researches into camomile flowers and blasted heath, which were all that lovely region afforded, suddenly succumbed and stretched out his limbs, and said, sleepily, "Good-night—U—cat—" and was off into the land of Nod.

The wagon, which, by-the-way, had passed the larger but slower vehicle, found him fast asleep, and Ucatella standing by him, as ordered, motionless and grand.

"Oh dear! what now!" said Phœbe; but, being a sensible woman, though in the hen and chickens line, she said, "'Tis the fighting and the excitement. 'Twill do him more good than harm, I think;" and she had him bestowed in the wagon, and never disturbed him night nor day. He slept thirty-six hours at a stretch; and, when he awoke, she noticed a slight change in his eye. He looked at her with an interest he had not shown before, and said, "Madam, I know you."

"Thank God for that," said Phœbe.

"You kept a little shop in the other world."

Phœbe opened her eyes with some little alarm.

"You understand—the world that is locked up—for the present."

"Well, Sir, so I did: and sold you milk and butter. Don't you mind?"

"No—the milk and butter—they are locked up."

The country became wilder, the signs of life miserably sparse; about every twenty miles the farm-house or hut of a degenerate Boer, whose children and slaves pigged together, and all ran jostling, and the mistress screamed in her shrill Dutch, and the Hottentots all chirped together, and confusion reigned for want of method: often they went miles and saw nothing but a hut or two, with a nude Hottentot eating flesh, burned a little, but not cooked, at the door; and the kloofs became deeper and more turbid, and Phœbe was in agony about her salt, and Christopher advised her to break it in big lumps and hang it all about the wagon in sacks; and she did, and Ucatella said, profoundly, "My child is wise;" and they began to draw near home, and Phœbe to fidget; and she said to Christopher, "Oh dear! I hope they are all alive and well: once you leave home, you don't know what may have happened by then you come back. One comfort, I've got Sophy: she is very dependable, and no beauty, thank my stars."

That night, the last they had to travel, was cloudy, for a wonder, and they groped with lanterns.

Ucatella and her child brought up the rear. Presently there was a light pattering behind them. The swift-eared Ucatella clutched Christopher's arm, and, turning round, pointed back, with eyeballs white and rolling. There were full a dozen animals following them, whose bodies seemed colorless as shadows, but their eyes little balls of flaming lime-light.

"GUN!" said Christie, and gave the Kafir's arm a pinch. She flew to the caravan: he walked backward, facing the foe. The wagon was halted, and Dick ran back with two loaded rifles. In his haste he gave one to Christopher, and repented at leisure; but Christopher took it, and handled it like an experienced person, and said, with delight, "VOLUNTEER." But with this the cautious animals had vanished like bubbles. But Dick told Christopher they would be sure to come back; he ordered Ucatella into the wagon, and told her to warn Phœbe not to be frightened if guns should be fired. This soothing message brought Phœbe's white face out between the curtains, and she implored them to get into the wagon, and not tempt Providence.

"Not till I have got thee a kaross of jackal's fur."

"I'll never wear it!" said Phœbe, violently, to divert him from his purpose.

"Time will show," said Dick, dryly. "These varmint are on and off like shadows, and as cunning as old Nick. We two will walk on quite unconcerned like, and as soon as ever the varmint are at our heels you give us the office; and we'll pepper their fur, won't we, doctor?"

"We—will—pepper—their fur," said Christopher, repeating what to him was a lesson in the ancient and venerable English tongue.

So they walked on expectant; and by-and-by the four-footed shadows with large lime-light eyes came stealing on; and Phœbe shrieked, and they vanished before the men could draw a bead on them.

"Thou's no use at this work, Pheeb," said Dick. "Shut thy eyes, and let us have Yuke."

"Iss, master: here I be."

"You can bleat like a lamb; for I've heard ye."

"Iss, master. I bleats beautiful;" and she showed snowy teeth from ear to ear.

"Well, then, when the varmint are at our heels, draw in thy woolly head and bleat like a young lamb. They won't turn from that, I know, the vagabonds."

Matters being thus prepared, they sauntered on; but the jackals were very wary. They came like shadows, so departed—a great many times; but at last, being rein-

forced, they lessened the distance, and got so close that Ucatella withdrew her head, and bleated faintly inside the wagon. The men turned, leveling their rifles, and found the troop within twenty yards of them. They wheeled directly, but the four barrels poured their flame, four loud reports startled the night, and one jackal lay dead as a stone, another limped behind the flying crowd, and one lay kicking. He was soon dispatched, and both carcasses flung over the patient oxen; and good-by jackals for the rest of that journey.

Ucatella, with all a Kafir's love of fire-arms, clapped her hands with delight. "My child shoots loud and strong," said she.

"Ay, ay," replied Phœbe; "they are all alike; wherever there's men, look for quarreling and firing off. We had only to sit quiet in the wagon."

"Ay," said Dick, "the cattle especially—for it is them the varmint were after—and let 'em eat my Hottentots."

At this picture of the cattle inside the wagon, and the jackals supping on cold Hottentot alongside, Phœbe, who had no more humor than a cat, but a heart of gold, shut up, and turned red with confusion at her false estimate of the recent transaction in fur.

When the sun rose they found themselves in a tract somewhat less arid and inhuman; and at last, at the rise of a gentle slope, they saw, half a mile before them, a large farm-house partly clad with creepers, and a little plot of turf, the fruit of eternal watering; item, a flower bed; item, snow-white palings; item, an air of cleanliness and neatness scarcely known to those dirty descendants of clean ancestors, the Boers. At some distance a very large dam glittered in the sun, and a troop of snow-white sheep were watering at it.

"ENGLAND!" cried Christopher.

"Ay, Sir," said Phœbe; "as nigh as man can make it." But soon she began to fret: "Oh dear! where are they all? If it was me, I'd be at the door looking out. Ah, there goes Yuke to rouse them up."

"Come, Pheeb, don't you fidget," said Dick, kindly. "Why, the lazy lot are scarce out of their beds by this time."

"More shame for 'em. If they were away from me, and coming home, I should be at the door day *and* night, I know. Ah!"

She uttered a scream of delight; for just then out came Ucatella, with little Tommy on her shoulder, and danced along to meet her. As she came close, she raised the chubby child high in the air, and he crowed; and then she lowered him to his mother, who rushed at him, seized, and devoured him with a hundred inarticulate cries of joy and love unspeakable.

"NATURE!" said Christopher, dogmatically, recognizing an old acquaintance, and booking it as one more conquest gained over the Past. But there was too much excitement over the cherub to attend to him. So he watched the women gravely, and began to moralize with all his might. "This," said he, "is what we used to call maternal love; and all animals had it, and that is why the noble savage went for him. It was very good of you, Miss Savage," said the poor soul, sententiously.

"Good of her!" cried Phœbe. "She is all goodness. Savage! find me a Dutchwoman like her. I'll give her a good cuddle for it:" and she took the Kafir round the neck, and gave her a hearty kiss, and made the little boy kiss her too.

At this moment out came a colly-dog, hunting Ucatella by scent alone, which process landed him headlong in the group; he gave loud barks of recognition, fawned on Phœbe and Dick, smelled poor Christopher, gave a growl of suspicion, and lurked about, squinting, dissatisfied, and lowering his tail.

"Thou art wrong, lad, for once," said Dick; "for he's an old friend, and a good one."

"After the dog, perhaps some Christian will come to welcome us," said poor Phœbe.

Obedient to the wish, out walked Sophy, the English nurse, a scraggy woman, with a very cocked nose and thin pinched lips, and an air of respectability and pertness mingled. She dropped a short courtesy, shot the glance of a basilisk at Ucatella, and said, stiffly, "You are welcome home, ma'am." Then she took the little boy as one having authority. Not that Phœbe would have surrendered him, but just then Mr. Falcon strolled out, with a cigar in his mouth, and Phœbe, with her heart in *her* mouth, flew to meet him. There was a rapturous conjugal embrace, followed by mutual inquiries, and the wagon drew up at the door. Then, for the first time, Falcon observed Staines, saw at once he was a gentleman, and touched his hat to him, to which Christopher responded in kind, and remembered he had done so in the locked-up Past.

Phœbe instantly drew her husband apart by the sleeve. "Who do you think that is? You'll never guess. 'Tis the great doctor that saved Dick's life in England with cutting of his throat. But oh, my dear, he is not the man he was. He is afflicted. Out of his mind partly. Well, we must cure him, and square the account for Dick. I'm a proud woman at finding him, and bringing him here to make him all right again, I can tell you. Oh, I am happy, I am happy. Little did I think to be so happy as I am. And, my dear, I have brought you a whole sackful of newspapers, old and new."

"That is a good girl. But tell me a little more about him. What is his name?"

"Christie."

"Dr. Christie?"

"No doubt. He wasn't an apothecary or

a chemist, you may be sure, but a high doctor, and the cleverest ever was or ever will be: and isn't it sad, love, to see him brought down so? My heart yearns for the poor man: and then his wife—the sweetest, loveliest creature you ever—oh!"

Phœbe stopped very short, for she remembered something all of a sudden; nor did she ever again give Falcon a chance of knowing that the woman whose presence had so disturbed him was this very Dr. Christie's wife. "Curious!" thought she to herself, "the world to be so large, and yet so small." Then aloud, "They are unpacking the wagon; come, dear. I don't think I have forgotten any thing of yours. There's cigars and tobacco, and powder and shot and bullets, and every thing to make you comfortable, as my duty 'tis; and—oh, but I'm a happy woman!"

Hottentots, big and little, clustered about the wagon. Treasure after treasure was delivered with cries of delight; the dogs found out it was a joyful time, and barked about the wheeled treasury; and the place did not quiet down till sunset.

A plain but tidy little room was given to Christopher, and he slept there like a top. Next morning his nurse called him up to help her water the grass. She led the way with a tub on her head and two buckets in it. She took him to the dam; when she got there she took out the buckets, left one on the bank, and gave the other to Christie. She then went down the steps till the water was up to her neck, and bade Christie fill the tub. He poured eight bucketfuls in. Then she came slowly out, straight as an arrow, balancing this tub full on her head. Then she held out her hands for the two buckets. Christie filled them, wondering, and gave them to her. She took them like toy buckets, and glided slowly home with this enormous weight, and never spilled a drop. Indeed, the walk was more smooth and noble than ever, if possible.

When she reached the house she hailed a Hottentot, and it cost the man and Christopher a great effort of strength to lower her tub between them.

"What a vertebral column you must have!" said Christopher.

"You must not speak bad words, my child," said she. "Now you water the grass and the flowers." She gave him a watering-pot, and watched him maternally, but did not put a hand to it. She evidently considered this part of the business as child's play, and not a fit exercise of her powers.

It was only by drowning that little oasis twice a day that the grass was kept green and the flowers alive.

She found him other jobs in course of the day, and, indeed, he was always helping somebody or other, and became quite ruddy, bronzed, and plump of cheek, and wore a strange look of happiness, except at times when he got apart and tried to recall the distant Past. Then he would knit his brow, and look perplexed and sad.

They were getting quite used to him and he to them, when one day he did not come in to dinner. Phœbe sent out for him; but they could not find him.

The sun set. Phœbe became greatly alarmed, and even Dick was anxious.

They all turned out, with guns and dogs, and hunted for him beneath the stars.

Just before daybreak Dick Dale saw a fire sparkle by the side of a distant thicket. He went to it, and there was Ucatella seated, calm and grand as antique statue, and Christopher lying by her side, with a shawl thrown over him. As Dale came hurriedly up, she put her finger to her lips, and said, "My child sleeps. Do not wake him. When he sleeps, he hunts the Past, as Colly hunts the springbok."

"Here's a go!" said Dick. Then, hearing a chuckle, he looked up, and was aware of a comical appendage to the scene. There hung, head downward, from a branch, a Kafir boy, who was, in fact, the brother of the stately Ucatella, only went farther into antiquity for his models of deportment; for, as she imitated the antique marbles, he reproduced the habits of that epoch when man roosted, and was arboreal. Wheel somersaults, and, above all, swinging head downward from a branch, were the sweetness of his existence.

"Oh! *you* are there, are you?" said Dick.

"Iss," said Ucatella. "Tim good boy. Tim found my child."

"Well," said Dick, "he has chosen a nice place. This is the clump the last lion came out of, at least they say so. For my part, I never saw an African lion: Falcon says they've all took ship and gone to England. However, I shall stay here with my rifle till daybreak. 'Tis tempting Providence to lie down on the skirt of the wood for Lord knows what to jump out on ye unawares."

Tim was sent home for Hottentots, and Christopher was carried home, still sleeping, and laid on his own bed.

He slept twenty-four hours more, and, when he was fairly awake, a sort of mist seemed to clear away in places, and he remembered things at random. He remembered being at sea on the raft with the dead body; that picture was quite vivid to him. He remembered, too, being in the hospital, and meeting Phœbe, and every succeeding incident; but as respected the more distant past, he could not recall it by any effort of his will. His mind could only go into that remoter past by material stepping-stones; and what stepping-stones he had about him here led him back to general knowledge, but not to his private history.

In this condition he puzzled them all strangely at the farm; his mind was alter-

nately so clear and so obscure. He would chat with Phœbe, and sometimes give her a good practical hint; but the next moment helpless for want of memory, that great faculty without which judgment can not act, having no material.

After some days of this he had another great sleep. It brought him back the distant past in chapters. His wedding-day. His wife's face and dress upon that day. His parting with her: his whole voyage out: but, strange to say, it swept away one-half of that which he had recovered at his last sleep, and he no longer remembered clearly how he came to be at Dale's Kloof.

Thus his mind might be compared to one climbing a slippery place, who gains a foot or two, then slips back; but, on the whole, gains more than he loses.

He took a great liking to Falcon. That gentleman had the art of pleasing, and the tact never to offend.

Falcon affected to treat the poor soul's want of memory as a common infirmity; pretended he was himself very often troubled in the same way, and advised him to read the newspapers. "My good wife," said he, "has brought me a whole file of the *Cape Gazette*. I'd read them if I was you. The deuce is in it, if you don't rake up something or other."

Christopher thanked him warmly for this: he got the papers to his own little room, and had always one or two in his pocket for reading. At first he found a good many hard words that puzzled him; and he borrowed a pencil of Phœbe, and noted them down. Strange to say, the words that puzzled him were always common words, that his unaccountable memory had forgotten: a hard word, he was sure to remember that.

One day he had to ask Falcon the meaning of "spendthrift." Falcon told him briefly. He could have illustrated the word by a striking example; but he did not. He added, in his polite way, "No fellow can understand all the words in a newspaper. Now here's a word in mine, 'Anemometer;' who the deuce can understand such a word?"

"Oh, *that* is a common word enough," said poor Christopher. "It means a machine for measuring the force of the wind."

"Oh, indeed," said Falcon; but did not believe a word of it.

One sultry day Christopher had a violent headache, and complained to Ucatella. She told Phœbe, and they bound his brows with a wet handkerchief, and advised him to keep in-doors. He sat down in the coolest part of the house, and held his head with his hands, for it seemed as if it would explode into two great fragments.

All in a moment the sky was overcast with angry clouds, whirling this way and that. Huge drops of hail pattered down, and the next minute came a tremendous flash of lightning, accompanied, rather than followed, by a crash of thunder close over their heads.

This was the opening. Down came a deluge out of clouds that looked mountains of pitch, and made the day night but for the fast and furious strokes of lightning that fired the air. The scream of wind and awful peals of thunder completed the horrors of the scene.

In the midst of this, by what agency I know no more than science or a sheep does, something went off inside Christopher's head, like a pistol-shot. He gave a sort of scream, and dashed out into the weather.

Phœbe heard his scream and his flying footstep, and uttered an ejaculation of fear. The whole household was alarmed, and, under other circumstances, would have followed him; but you could not see ten yards.

A chill sense of impending misfortune settled on the house. Phœbe threw her apron over her head, and rocked in her chair.

Dick himself looked very grave.

Ucatella would have tried to follow him; but Dick forbade her. "'Tis no use," said he. "When it clears, we that be men will go for him."

"Pray Heaven you may find him alive."

"I don't think but what we shall. There's nowhere he can fall down to hurt himself; nor yet drown himself, but our dam; and he has not gone that way. But—"

"But what?"

"If we do find him, we must take him back to Cape Town, before he does himself, or some one, a mischief. Why, Phœbe, don't you see the man has gone raving mad?"

A SONG IN MANY KEYS.

PERHAPS for the reason that it was impossible for him to go to Watkins Park, Mr. John Taylor determined upon going. His presence would give he knew what pleasure to his cousin, Mrs. Horatio Watkins. She had always been his favorite, and so he penned a letter of acceptance in answer to her note of invitation, and proceeded to decide on the gifts he would carry with him. She should have those rose-leaved ornaments, each brightened by a diamond dew-drop, which he so much admired. He knew Sally's taste. Things delicate, chaste, and costly she liked, and he could well afford to consider what jewels she would choose if free to select.

No doubt Sally, mother-like, would now prefer that these ornaments should be presented to Elsie instead of herself. No matter. She might make of them whatever disposition she pleased, but she should know that he had purchased them for herself. There were other ornaments in filigree and enamel which were pretty enough for a girl, and all the rage, and among these he found

"perfect beauties" for his cousin's young daughter; so that business was dispatched.

There remained now but one thing to do—he must take himself to the dépôt, if he would present himself among the masqueraders to assemble to-morrow night at Watkins Park. This feat was the most difficult to accomplish. Nobody could complain of John Taylor's indecision in the gold-room; it was only when he fell back on himself for the transaction of business of a purely personal nature that he found himself in the lurch. His friends so well understood this, that they invariably took the conduct of him when he had made an engagement of a social character.

One of these devoted individuals stood on the pavement in front of the hotel, waiting for his appearance, while John in his room made his final preparations. The watchman had evidently determined on performing a desperate deed at a given moment. He stood with his eyes fixed on the hotel clock: when the minute-hand should reach a certain point he purposed an attack.

John Taylor meantime was laying in his valise exquisite evidences of himself—embroidered shirts, vests white, buff, and lavender, and coats which my rough pen absolutely refuses to describe. These things, and the fine gloves and the perfumes, pertained to him as really as his wise doings in brokerage, and though the latter might sometimes excite his misgivings, these never did. The paraphernalia of fashion stowed away, it only remained for him to get to the dépôt. He was thinking of this while he put the key of his valise into his pocket, when somebody knocked at the door; it opened, and there stood William Wells.

"Oh," said William, the watchman who had stood waiting on the pavement below, staring at the clock for half an hour—"oh, you're here!"

"I believe I am," said John, throwing himself on the sofa.

"But, my dear fellow, do you intend to go on the four train?"

"Certainly."

"Well, you have just five minutes to get to it. I was afraid you would think you had all day before you. There's a carriage waiting for you: I ordered it."

"Where are you going with my baggage?" exclaimed John, springing from the sofa and catching up his hat.

"Follow and learn," answered William, half-way down the stairs.

"Go like lightning!" he directed the driver, when he had John safely in the carriage; and the order was obeyed.

"I have your ticket. Secure a seat, and I'll throw your check after you. The cars will be moving in less than a minute." William said this as he sprang from the carriage, with the valise in his hand.

"What should I do without that good fellow?" asked John of himself, as he jumped on board the train. He would not have performed his journey that day, we may be very certain.

And what if he had not? Why, this song would not have been sung.

In the baggage-master's office there was so much confusion it looked as if there might easily be a "hitch" in William's operations. But he was a resolute youth; he wasn't afraid of pushing—that art of arts pursued with so much ardor by our young folks; and though there were at least twenty-five persons in the office waiting to be served at the same moment, and though an old friend whom he had not seen for years must needs present himself for recognition precisely on the instant when he was demanding his check, Will kept his eye on his game, and having bagged it, walked off triumphant to present check and ticket on the head of his cane at the window whence John's arm projected, just as the engine began to move.

In the car which carried Mr. John Taylor sat a woman, who gave a little start when she saw him coming in: a start of recognition—of recognition, though, that looked for no return. The cat looked at the king, we may believe, but it was never hinted that the king looked at the cat. Not to suggest that Mrs. James Thompson had any feline resemblances. No; merely because of her decent poverty do I remind myself of the proverb. The fortunes of these two persons were obviously so different, they were separated by so great a gulf, that it would be no more difficult to think of a cat *perceiving* a king than it would be to suppose the existence of friendly relations between these two.

The conductor, if a judge of human nature, looking at the one, might have felt a little difficulty about pronouncing upon him: he was "a bull" perhaps, "a bear" perhaps, or a "fancy gentleman"—one would prefer not to be positive; but as to the woman in shabby mourning, she unmistakably was the earner of her own living: not that she looked defiant, or in the least degree strong-minded, but she did look self-respectful. Evidently a widow, evidently decent, something had done its best to put her down, and that something had succeeded in a measure. Produce me the clairvoyant who could have discovered to the conductor any thing like a connecting link between the two!

After a few miles Mr. Taylor, who had given himself up to the luxury of lazy observation, tired of the entertainment, and taking out his note-book, was reminded on the first glance of Bowles's letter, which he had intended to answer before he left town. Then he felt in his pockets for the letter,

and found that he had left it behind him. Still there were the points written in his note-book to which he had intended to reply. Bowles, it seemed, was hard up. His invention answered admirably: it did every thing claimed for it; but somehow he must have money to bridge over, or he must stay on the side opposite success. Mr. Taylor had already served him such a good turn about the patent, perhaps he might advise him whether it would be best to try to get up a stock company, or to sell out to some wealthy manufacturer, or to hang on in the way he was now doing.

Mr. Taylor reflected, and went to sleep over it, and slept through all the pauses at way-stations — steadily on, through sunset and even-tide and moonlight, until, at twelve o'clock, he heard somebody shouting "Henderson!" in his ears.

Meanwhile, though many people came and went, the woman to whom we have alluded kept her seat; but though she knew when she left the city dépôt that many an hour of travel was before her, she sat and thought, and to sleep was the last thing attempted, desired, or possible. Was she not going to her son? Yes. But without any very joyful anticipation, if one might take into consideration the anxious expression of her face. What might not have happened before she went back to town on Saturday, to resume her life there copying papers for the great firm of "Brydges?" She would have given her son away. But has she not already done this? Has not the bitterness of death been tasted? And yet she reminds herself while the train speeds on, *Is not the Spirit of the Lord still moving on the waters, as of old, "in the beginning?" and can one perish in them who relies on Him?*

She, too, has a letter in her mind, and the answer to it which she had made.

Only since the week began that letter was received from her son, and since then the world seemed to have come to an end.

James had not written to ask her advice, but to make known to her his intention. Next Thursday morning, he said, he was to be married. At nine o'clock, "bright and early," in the old church—would she come? Of course she must. His desperation had made him see his duty clearly—what would hers do for her? The only argument he used was, "I know, dear mother, that I'm acting as my father would have done."

Was he? she thought. She knew the circumstances. Mr. Jackson had died suddenly; the family were left quite destitute; the girls must support themselves, Netty, the youngest, who had been three years engaged to James, as well as the rest.

And why not Netty as well as the rest? Was she not capable? And was not James merely another man's man, and not his own master?

Mrs. Thompson was twenty-three years beyond the time when she would have allowed a lover to act as her son had determined to act. She had passed through very dreary and sorrowful experiences. So clear had become her convictions with regard to this world, so difficult was the path which she saw opening before her son, valiantly taking on himself who could foretell what cares, that her first impulse had been to write him that he must do no such crazy thing as fulfill his declared intention. He must wait, *in justice to the young lady* he must wait, until he felt certain that he could support her in a way that a man ought to wish to support his wife. He had no right to ask a young girl to share his fortunes until there was a prospect that they would be less hard than now seemed likely.

But no such letter was written, or even begun. James should never know that she had contemplated the duty of writing in such a strain to him. Poor widow! she found herself occupying in imagination the place of that young lady, and choosing to share the fortunes of the man she loved, however hard they might be; and so she had carried her son's letter to bed, laid it under her pillow, bathed that pillow in tears, and in the morning answered it in a way that should make all women proud of her. Hail to the human heart grown wise in the wisdom of the world, and able still, on the great election days, to cast its vote for the cause that *may* insure earthly tribulation, but also, and in spite of that, everlasting peace!

And then she had made her little preparations to attend the wedding, obtained leave of absence, and a friend secured her check for her, at the last moment, too, as Mr. John Taylor's had been secured for him.

And there she sat now, with the check in hand, thinking of all these things, and glad when the conductor relieved her of her ticket, because she would then have one thing less to burden her aching brain.

When you consider that she was traveling like a nabob, on the strength of the ticket she had paid for, you may wonder that she started and seemed so embarrassed when she saw that Mr. Taylor was also a passenger on the train. But then you do not understand how all persons employed in the office of the Brydges regarded this gentleman. The widow was one of the copyists who wrote there, and she, with all the rest, bowed down abased, figuratively speaking, when the great man crossed the threshold of the firm. I suppose it was the homage done there to SUCCESS, as represented by this successful broker, that made the woman even now, when acting on an independent basis, feel that it wasn't quite the thing for her to be sitting at her ease there on a car level with Mr. Taylor. In her own world there was no cause for fear that she would not behave

with decorum and self-respect—interiorly as well as externally she would preserve her equilibrium—but the atmosphere breathed at Brydges' was denaturalized, and she had breathed it now for three or four years continuously.

The Henderson House was a notable inn near the Henderson station, and here Mr. Taylor found himself at midnight. In the morning, as he ascertained, he could obtain any kind of vehicle he might wish for, and a pleasant ride of five miles would bring him to Watkins Park.

He might then resume his nap at once in the large cool chamber to which he was conducted.

Well—yes—it might seem so. But a little mistake which had been made in the matter of baggage kept him awake and rather busily reflecting.

When he gave his check to the baggage-master, as he glanced at the valise produced he thought that it had suffered from the journey more than he had. It looked so shabby, indeed, that for an instant he had suspected that a mistake had been made somewhere. Half asleep though he was, he had said to the baggage-master, "That isn't my trap," and the man had answered, "You gave me your check, didn't you?" and then had walked off.

Of course it was his check, and there was "J. T." in small white letters at the end of the valise. But now in his chamber, as he unlocked the portmanteau, hardly expecting that his key would perform the service, and set at ease by the instantaneousness with which it executed the feat, there was revealed to his eyes a marvel which equaled in result any one of Signor Blitz's magic performances.

In the first place out floated an odor of violet and mignonette; then he saw a garment of black silk, and then a book; then a pair of womanly boots, a pair of lilac gloves, a shawl, and finally a bouquet in a little box, the cover of which had slipped off. He saw all these things at a glance, as you might say, and yet several glances were required before the several impressions answerable to shawl, gloves, boots, dress, book, flowers, were produced.

Making these glances he felt as a thief may be supposed to feel, yet a certain fascination held his eyes until he clearly understood that by some mistake he had become possessed of a woman's baggage instead of his own.

The flowers and the gloves made him think of his own missing splendors and of Sally's party. Was the fair owner of this property likely to make her appearance in it to-morrow night at Watkins Park?

The sweet odors of the flowers, and the delicate hue of the unworn lilac gloves, must, I think, have conciliated the gazer, and awakened his sympathy, for he said to himself, as he stood there looking at the valise, "Who knows but here is a leading?" It was one of John Taylor's habits of mind, one of his weaknesses, if you like, to look at all events that concerned him as in some sort leadings. He saw that he had made an opening, and he was lazily concerned to discover whither it might conduct.

The book might give him a clew. He took it from the place where it had been laid by the owner, and of course he felt a little shocked when he did so. He was curious, vulgarly curious, to learn the name of the owner. There it was on the fly-leaf: a woman's name, possibly a fair young girl's name—anyway, Dorothy Davidson's.

Next he turned the leaves—still seeking a clew, I suppose—humming, meanwhile, "Come, Dorothy, come." Then he paced the room, felt in his vest pocket to satisfy himself that the trinkets he had purchased for Sally and her daughter were there, and finally he threw himself upon the bed.

The book then opened of itself, it seemed to him, at a little poem entitled *Philip, my King*, and he read it. Twice he read it, for it was not as familiar to this gentleman as it is to you and to me. Twice he read it, and then turned the page, and tears were in his eyes, for he thought of his mother, and of what he might do for her (who had all heaven!) if she was only living now.

The leaf had a soft, worn, cottony feeling, as if it had often been turned; the gloss was quite worn off. A folded paper was lying between the leaves, and that he opened and read. "Shameful!" Most true! But then it was true also that he said to himself he was seeking a clew that would direct him to the owner. So I make this statement, hoping to obtain for him a more kindly verdict. The man is no client of mine—he must look for another apologist. But perhaps you will now feel disposed to justify him. *I don't.* What he read was this, written as if by the hand of an engraver who had studied clearness, simplicity, and precision:

"Let me, oh, let me cease to live so entirely for the safe one, the delivered, the immortal! Stand thou, my son, where thy father stood, and while I live I will serve thee. Sacred to me art thou because of that sacred one yonder. O thou infinite lover, in whom I love husband and son, thou canst lead us, thou must."

At dawn John Taylor was still lying on his bed, awake, with the book in his hand, thinking of the exceedingly narrow range he had allowed his sympathies and his faculties during the six prosperous years which had passed since his name became known to the board of brokers. And he either really wished, or else imagined that he wished, that something would happen to prevent his return to town, now that he was fairly out of it.

"I haven't found yet the work or the place I was meant for," said he. Fancy the waves of sound conveying a message like that to the Brydges, who quoted him every day of their lives as the one eminently successful man!

He remembered a girl who might have written concerning him what some woman had written here concerning some man. To have so loved as to have won such love, would not that have been a truer success than he had achieved? Love—was it a real power still in the world? He groaned when he thought of the unbelief which had obtained an influence so hardening over him. But then he believed that he could still love such a woman as this Dorothy, perhaps—at least such a woman as his own mother. But where could such a one be found? Perhaps at his cousin Sally's, to-day. But then this mistake of baggage seemed to have interposed to prevent whatever might have happened at his cousin Sally's!

So he lay there and discussed the point. Reluctant always to make a change that involved any exertion, a week spent in bed at the Henderson House began to look more attractive to him than the scene on which he would be gazing, probably, within four or five hours. The mistake of the valise could only be rectified by some activity on his part. He must either recover his missing effects at once or provide himself with other appareling. A return to town in either case seemed necessary, and of that he felt incapable. The bed on which he was lying, therefore, appeared to be the one place desirable. The haven he had gained he had no wish to leave. His mind continued to dwell upon the peace and the comfort of it till he recollected what Sally had told him about the station and the house in the years when she was accustomed to spend the autumn there for the sake of the gorgeous woods.

He might remain where he was, and send his gifts forward with apologies. Sally would have no reason to suspect his nearness. He was dull, too dull for the society of young folks met for pleasure, and he felt worked out, now that he had leisure to ascertain his feelings.

The more he thought of all this the less disposed he felt to mingle with youth and gayety. Diamonds and filigree would more than fill his place. Having proceeded so far in reflection, John arose and looked from the windows. He would dispatch a messenger forthwith to Watkins Park, and telegraph Will to hunt up his valise; after that he would go to bed, if nothing better offered.

It was still early when he went down stairs to the hotel office and asked for writing materials. Furnished with these, he sat down to write a note to his cousin. He was in the midst of a well-constructed sentence which displayed not a little tact, when an elderly woman came in from the street, and addressed the clerk at his desk.

"Was any mistake made here about baggage last night?" said she.

The clerk told her, with an air, "This is not the baggage office, madam."

"No," she said, "I know it. I have been there. But I thought perhaps you might have heard something—somebody inquiring, maybe."

John Taylor, hearing all this, began to hum "Come, Dorothy," and to make nonsense of his letter. Of course this individual wasn't Dorothy, but she was quite obviously involved in this trick of fortune which concerned merely Dorothy and himself. She was an elderly friend, perhaps, of that sweethearted widow.

"Is there any mark on your valise?" asked the clerk.

"The same mark there is on this, that don't belong to me," was the answer. "But I saw the minute I looked at it that it wasn't mine."

"Well," said the clerk, "I'll inquire among the passengers; there's one of them sitting there at that table now."

"Thank you, Sir," said the woman, and she turned quickly toward the table, and saw—Mr. John Taylor!

But a cat may look at a king.

This second observation of J. T. since she had left the town office was not as startling to her as the first had been. She was able now to perceive that Mr. Taylor was merely a transient guest in the Henderson House, though elsewhere his nod might mean millions. Under certain circumstances it might have taken her breath away to think of having his property in her hands, but just now she was cool enough. By this you will understand that, left to herself, she remembered *effectually*, if not very distinctly, that the blood of two or three generations of Americans was in her veins.

It was Mr. Taylor, in fact, who felt a little misgiving looking at her, for his commonsense dispelled the illusion he had allowed to envelop Dorothy, and he said to himself, "Of course the things are hers—the flowers, gloves, and all," and he blushed in a way that showed it was not agreeable to think that he had, uninvited, possessed himself of a thought or two of hers.

It was time he should make a sign, so he looked up, pushed the writing materials away, and glancing toward the clerk's desk, invited the question, which he heard the next minute, whether he had found his baggage all right the night before.

"All wrong," he said.

Then the woman explained, and it appeared that there was another J. T. in this world besides John Taylor; and before he was called to breakfast Mr. Taylor and Mrs. Thompson had exchanged portmanteaus, and J. T.,

par excellence, had privately decided to go on to Factoryville by the eight-o'clock stage.

Why? Because this Mrs. Thompson was going. Absurd! I know it, but that is his business. Bowles, though, I may mention, lived at Factoryville. There was no calculating with certainty as to what Mr. Taylor would or would not do, or where, or how, or when he would come out with success in his hand; the only thing to be relied on was the *success*. Every body said so who had dealings with him.

They had a good many miles before them, and the greater part of the day were the only passengers.

"We shall have a peaceable journey," said Mr. Taylor, as the driver shut the door on the surprised woman and the man who was following his "leading."

"Yes," she answered, "if our baggage don't fall out by the way;" and then they both laughed, he precisely as if he were not worth his millions, and she as if she did not know that he was, and as if also she had forgotten that she was going, sad-hearted as to a funeral, to the wedding of her son.

Were they to make a silent journey? Time must decide. Time's decision was that there should be no lack of talk between them. The woman knew every mile-stone on the road, and her husband and she knew Bowles of Factoryville, of course. Ah, yes!

She spoke of her husband in such a way that her fellow-passenger for a long time supposed that he might be living on earth yet. At last, however, it became as clear to his mind as Wall Street is clear on a Sunday that she was a widow, and Dorothy besides; and that she was a fair-faced, sweet-voiced woman his eyes and ears assured him.

And then he learned the poor little insignificant fact that it was her husband who built the first factory that was ever set to work in Factoryville. Factoryville had a history of its own which she knew well. It had grown, within her memory, from a hamlet of two hundred to a town of eight or ten thousand inhabitants, and was now making a great effort to get rid of its name.

And had she friends still living there?

Oh yes, it was there her son lived—her only son, James.

So she was to speak, as it were by invitation, about her son to Mr. Taylor—Mr. John Taylor. To think of it!

It was her boy she was going to visit. In fact, he was to be married the next day, and she had obtained leave of absence from Mr. Brydges, Jun., to attend his wedding.

Mr. Brydges?

Yes: she copied papers in his office.

Ah!

Sweet odors of mignonette seemed to float around Mr. John Taylor as he listened to this brief story, and he seemed to have a vision of white lilies. He was surely about to begin life over again.

"I found myself too late to attend one festival," said he, in a lively tone, and he had actually persuaded himself that this was true. "I might attend another if I had an invitation."

"If you are going to stop over," said the widow, politely—she was as old-fashioned as politeness itself is—"if you are going to stop over, the wedding is to be in the church, very early; at nine o'clock in the morning." After a little reflection, or perhaps it was only a pause of hesitation, she added, "I did not expect it for six months yet. It is quite sudden."

"Don't you agree with him as to the wisdom of the movement?" asked the man from the gold-room, as if he had been her brother. They say you can not travel with a woman half a day in car or stage-coach (I don't know how it is about steamboats), without having a revelation granted you of all the secrets of her experience. But it would seem that the information Mr. Taylor obtained on this day's journey was not altogether thrust upon him. He asked a good many questions; provoked, perhaps, some expectations. At least nobody will wonder at it if the mother thought while they talked, "Here's a man who does what he pleases—and there's my poor James!"

"It might have been better on some accounts if James had waited a little," said she. "Yet I don't know that it would be right to say so to either of them. I can not say it. You see, Sir, the young lady's father died quite unexpectedly, and my son says he feels bound to make the family smaller by one, and he *has* a better salary than he had at first. James is very ingenious. He is like his father. I don't think Mr. Bowles would part with him on any account."

And so it came out very clearly that James Thompson was with Mr. Bowles. "There, that's it!" thought Mr. Taylor. "I knew there was something to come." One of the great differences between individuals is this, all are expecting something, but all don't know when it arrives. What says the proverb, "*Many meet the gods, but few salute them.*"

"If your son is an inventor," said he, taking his time to say it, "his way is easy enough. There's nothing that I know of equal to the head of an inventor. It is the best kind of head a man can have on his shoulders."

John Taylor thoroughly believed this, and the widow could not doubt his sincerity. Yes, she thought, it is a great thing to be an inventor; but she could not think without a pang of the years through which her husband had passed—the make-shifts, the poverty, and death ending all just as they were coming into port after their long, tempestuous voyaging.

But it was, as the gentleman said, a great thing, a very great thing, to have the head of an inventor. A smile lighted up her face, and seemed to renovate each feature, as she dwelt upon it. Perhaps it might not be the most profitable head, as he had claimed, but certainly it was the noblest; and sweetest of all smiles that ever glowed on mortal countenance was that which in painful defeat or in victory had shone on her husband's countenance.

She did not speak; she was busied with these recollections which all lay on the other side of the grave—on that unapproachable earthly side over which the sunshine was always so solemnly resting.

By-and-by she was startled, perhaps by the sound of a voice rather than by what the voice said.

"How is it about Mr. Bowles—and your son? Does James satisfy him?"

"Oh yes."

"Why don't he take him in as a partner?"

"That isn't possible," she said; but not because she had not thought the possibility over, and reasoned with herself many and many a time on the impossibility.

"He is the foreman, though, you say, and necessary."

"Mr. Bowles told me last year," she answered, "that he didn't know how he could get on without James."

"He won't let him go if the business is worth a cent. Your son must make use of his opportunity," said John, speaking forcibly, from conviction: this was the business he was to attend to; for what else should he spend the day on the road to Factoryville instead of answering Bowles's letter by mail?

"I will tell you," said the mother—and you know that she believed the Spirit of the Lord to be still moving on the dark waters, and also that she, poor soul, still trusted in Providence—"I think if my son don't push his way now, he never will be his own man as long as he lives. Mr. Bowles and every other man will let him stand in the background as long as he will consent to do so. This is the thing that has troubled me. Perhaps I don't do right to say it, Sir; but you will understand me."

Was it not enough to make one smile to hear her saying that to Mr. John Taylor? But he did not smile. Her anxiety, her earnestness, her modesty, her humility, touched his heart.

"I am glad you have told me," said he. "As you say, marriage is the making of a good many men, but it nips off the enterprise and the hope of a good many too. I believe in Providence myself, ma'am. I agree with you that if James is like other men, he is going to take his stand to-morrow, and it speaks well for him that he is determined to marry the young lady off-hand, now that she is in trouble. I like it better than if he had let her go away to earn her own living. If she has a mind to help him, it's better she should do so after they're married."

If he wanted to know whether he had spoken to the purpose, Mr. John Taylor had only to look at the widow.

Who would have prophesied, when she set out on her journey, her heart so filled with gloom, that before she had arrived at Factoryville the voice of a man so wise in the affairs of this world, and so successful, would be saying to her words which would make her see the world, as it were, created anew for her son? How ashamed in her heart was she that she had dared to doubt or to murmur, as though Heaven could have in store for her any thing really heart-breaking and evil! How ashamed of the tears she had shed on the receipt of her dear boy's letter, and of that feeling that in giving her consent to his marriage she had, as it were, lost him!

When the stage drew up toward the steps of the Factoryville inn the widow said:

"I can't tell you how I feel your kindness. You are the last man I would have expected to tell all this to. There is my son waiting for me! I can speak to him now with some courage: I believe all will be well, just as you think."

"May I come to the wedding, if I can find my way to the church?" asked Mr. Taylor, as James came toward the stage door to open it. He had seen that his mother was a passenger.

"Do come!" she answered. "Any body can tell you where it is. At nine o'clock!" She had apparently forgotten all the astonishing and magnificent things that she had ever heard about him, and invited him as cordially as she would have invited an old friend, or you or me.

Standing for a moment on the green in front of the inn, Mr. John Taylor looked at the widow's son, and made up his mind. The widow said, as she walked away with her boy:

"That gentleman, James, is one of the richest men in the city. And made all his money himself. And such a sensible man! I wouldn't have believed it! I told him about you, and he says you're going to do the right thing, bless you!"

Whereupon, moved by the tearful energy with which the last words were spoken, the young man—a sturdy, dark-browed son of labor—kissed his mother on the public street.

"There's an extry fine piece of crockery for you," said one of the loafers on the tavern steps to another, turning and looking at Mr. John Taylor as he walked into the bar-room.

"Soft bake," said another. But what if they had seen the rose leaves and diamonds

in the stranger's vest pocket, or surveyed the contents of his portmanteau? Or what if they had known the thoughts that he was thinking about his ended journey?

Wherever he was, in Factoryville or elsewhere, Mr. Taylor's purposes were distinctly ascertained. He had now to answer Bowles's letter, but moreover, and chiefly, to find out about James. And first of all he must ascertain the general estimate and opinion of business done at the factory, and the importance of James Thompson in the establishment.

If the lovely young bride had known all he was thinking, and the wonderful delight he had in his thinking, she would not have been so surprised when she saw him next morning looking at her so kindly from the front pew, where he stood with Mr. Bowles during the ceremony.

And if she had known what her husband knew when she walked out of the church, leaning on his arm, she could not have been so surprised to see how untroubled his eyes looked, and how serene his face, as he said,

"You and I must trust in Providence. There's nothing like Providence for us, Netty. It is all right."

For while he waited in the porch for Netty and her family, standing there with his mother, Mr. Bowles had come in with the stranger who rode over to Factoryville in the stage yesterday, and had said to him, "I have brought you a wedding present, James. You come into the firm with me to-day, as well as make your contract with Miss Netty."

And then Netty had come, and the organ was sending forth the glad sound of the *Wedding March*, and the minister stood in the chancel, and the sexton outside had his hand on the bell-rope ready to tell all the good folk far and near of the brave deed done in the village church at that early morning hour. So there was no time to be talking about business.

It is a good thing to have influence—a great thing to have earned it. John Taylor felt that, of all his operations, this was the one that paid him best when he stood in the little parlor of Netty's mother, and it was talked over in the happy circle that Mr. Bowles would take James into partnership with himself that day. He smiled benignly as a god when he made his wedding present to the bride through James's mother—the very ornaments he had bought for his cousin Sally's daughter, thinking meanwhile how different the trip he had made and the festival he had attended from any thing he could have anticipated. But who that sets out on a journey will venture to say where he is going, or what may be the end thereof?

Of course he had bought a share in Bowles's business, and had saved Bowles not a little perplexity by the answer he made to his letter, coming forward so unexpectedly with plenty of money when it was so badly wanted.

James Thompson did not discover all this till some years later—about the time, probably, when Mr. Taylor went to Factoryville and bought out Bowles, and himself entered into business with J. T., Jun., as a machinist and an inventor, and so realized the dream of his youth, which was to produce something, and not merely to accumulate.

I dare say you are wishing now that he had also married Dorothy in those good days. That may have been his wish—in fact, it was! But how could it be done when she was always thinking of one who waited for her in the heavenly place?

No; but there was another good woman in the world for a good lover—and so, of course, he found her.

WHEN A DREAM COMES TRUE.

I hold your hand in mine, my darling, darling;
I look within your eyes;
I ask you idle questions, only caring
To hear your low replies.

And all the while the glimmer of a wonder—
A moon-lit rack of cloud—
Flits o'er my silent heaven of joy, while under
Its stars my soul is bowed.

I think how oft the future will require it—
"Ah, how then did it seem?"—
To-morrow and to-morrow will desire it
Vainly as any dream.

What is it more? In dreams the eyes are holden;
They know not near from far;
I wake with outspread arms, a shadow folding—
And such life's visions are.

It is but touch and sight a little plainer,
A voice that telling, hides;
I doubt, "O heart, art thou so much a gainer?
For something still divides."

O fire of God, O living, wingéd creature
That in this clay doth rise,
How canst thou warm to thy diviner nature
These lips and hands and eyes?

Too eager quest, that hastest to their meeting,
Hoping desire to fill,
Thou standest half abashed, in tenderest greeting,
Yet finding welcome chill.

With stinted bread the life-long hunger staying,
With fasting visions blessed,
With longing that makes life perpetual praying,
A stranger her confessed.

If yet, O dearest heart, the world grows dearer,
Because 'tis sweet to stand
(While that which never has enough cries, Nearer)
One moment hand to hand,

What will it be when every barrier breaking
Lets heart to heart come through?
Will heaven leave one corner for an aching
When the long dream comes true?

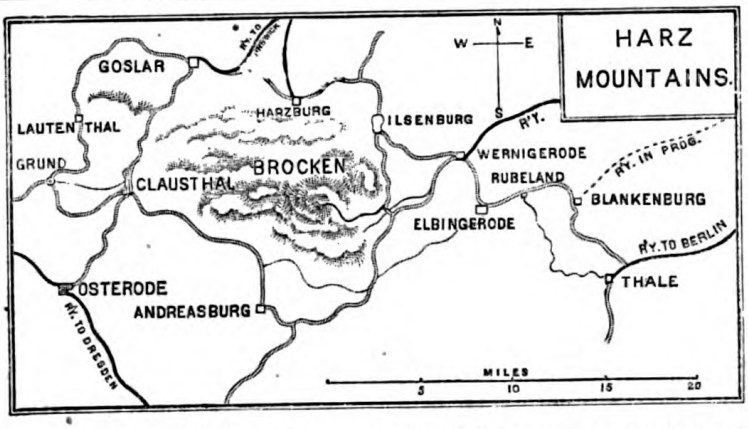
THE HARZ MOUNTAINS: A TOUR IN THE TOY COUNTRY.

By HENRY BLACKBURN.



ON a low seat, in an old-fashioned, unfashionable public garden, on the south side of Hanover, there is little Gretchen surrounded by babies, knitting and staring with all her eyes. It is a quiet, rather deserted-looking spot, with no attempt at trimness or attractiveness—a poor dilapidated "Terrasse," or public walk, with old wooden seats, where Carl and Fritz have carved their names, and hacked about with pocket-knives, and otherwise made themselves disagreeably at home. But it is, nevertheless, the place in Hanover to-day for quiet and rest; a place where babies, strapped in stiff card-board packets, are brought to sleep, where lovers come to love, and old men to dream.

"*Unter den Linden*," as we sit here to-day, let us turn our eyes southward, and scan the blue horizon. As we look we can trace a far-off sea of mountains, low, smooth, and spreading east and west, like a receding tide upon the sands. It is a deep sea—a sea of many mysteries, legends, and dreams — the source of inspiration of Goethe's poetry and Heine's philosophy. "Unter den Linden," there come upon the south wind echoes of the *Walpurgisnacht*, and memories of the loves of Marguerite. The spirit-land of Northern Germany is before us. Poets, artists, philosophers, and the children of a thousand German homes have fed their fancies, and moulded their ideas of life beyond cities, from the little range of mountains which we shall venture to call the "Toy Country" of Northern Germany. We will not dwell on the poetic associations of the Harz at the outset, but rather tell the reader what it is like to-day—what it is that attracts in such numbers the inhabitants of Bremen, Hamburg, Hanover, and Brunswick, and why the traveler on his way from London to Berlin or Vienna would do well to turn aside for a few days and explore a region about which scarcely any thing seems to be known. If the tourist refers to his hand-book for Northern Germany, he will there be told that it is hardly worth the while of the hunter after the picturesque who has seen other parts of Europe to go far out of his way to explore the Harz, unless he be a geologist, or interested in mining operations, and he will learn that this, the most northerly range of mountains in Germany, is only about sixty miles by thirty in extent, and that its highest peak, the Brocken, is only three thousand feet above the level of the sea. The attractions of the Harz Mountains to the inhabitants of the flat countries, in the burning days of July and August, are greater than the sea-breezes of their coast. The charm of mountaineering, and walking on heather-covered hill-sides, and wandering freely in forests of pines, is greater and more alluring than the casinos on the sea-shore. Thus it is that the capitalists of the northern towns of Germany, especially Bremen, are popularizing the principal valleys in the Harz, construct-

ing railways and hotels, and turning little villages into prosperous summer towns. The crowded inhabitants of the old streets of Bremen and Leipsic, where children live like caged birds for nine months in the year, fly with natural instinct to trees and woods, to freedom and fresh air, to see in real life the little red and white houses, the stiff pine-trees, the flat-sided sheep, the spotted cows, the herdsmen in brown and green "Noah's-ark" coats, and the formal procession of pigs, goats, and sheep that they had played with in babyhood. The process is now made easy enough for all classes. A "through" ticket can be taken from Bremen to Harzburg, and the journey is accomplished in about six hours.

What there is to see in the Harz Mountains, and how the holiday-makers beguile their summer days, the tourist who is hurrying to Dresden, where the lovely Madonna del Sisti will greet his delighted eyes, or to Vienna, where the world's fair of 1873 will open before him, may see for himself in less than a week, by following the route indicated in this narrative, with the assistance of the above map.

Leaving Hanover, with its dirty streets and sunburned walls, with its old palaces covered with Prussian *affiches*, we take the railway to Brunswick and so on southward

A GLIMPSE OF HANOVER.

to Goslar, in the Harz Mountains. The railway station and its surroundings are so modern and prosaic, and the shrieking of the engines so incessant, that we might fancy ourselves at Lyons or Manchester, were it not for the carriages which are still stamped with a royal crown, and for the unmistakably German faces in the crowd.

From Hanover we pass eastward to old-fashioned Brunswick, and, with a glimpse of its old gables and streets, we are soon again in the open country, winding through corn fields, past formal little villages with houses of the familiar toy pattern, and little wood-

A MID-DAY DREAM.

en children standing bare-headed in the sun. We spend several hours unnecessarily at wayside stations, while the conductors of the express train consume innumerable flagons of beer, and sit down to smoke with the station-masters in a mid-day dream.

One of these long delays is at the little station of Vienenburg, a junction between two lines of railway, one to Harzburg, the other to Goslar. In about an hour after leaving Vienenburg we find ourselves gradually ascending the mountain slopes that hide the city from our view. A glance backward toward the plains, and we can discern the distant cities of Brunswick and Hanover glistening in the sunlight; a glance forward and upward, and we find ourselves winding round and under the walls of a great city. There are watch-towers above our heads, and the "cutting" through which the train passes is in reality the old castle moat. The distance we have come from Brunswick by the mail train is twenty-seven miles, and the time occupied on the journey has been four hours. But the transition is

A STREET IN GOSLAR.

rapid enough, and the contrast between the old and the new is both sudden and striking. On one side, as we approach this old imperial city, are the watch-towers, where warriors with bows and arrows stood guard over its treasures eight hundred years ago; on the other side the railway signal-man of 1872.

But Goslar—this strange old town set on the slopes of beautiful hills—whoever heard of it before, excepting as "the head-quarters of a mining district—bleak, dull, and uninteresting?" Have we not made a discovery here of a new world of interest? What is its history—to compass in a few words eight centuries of time? A city rich, flourishing,

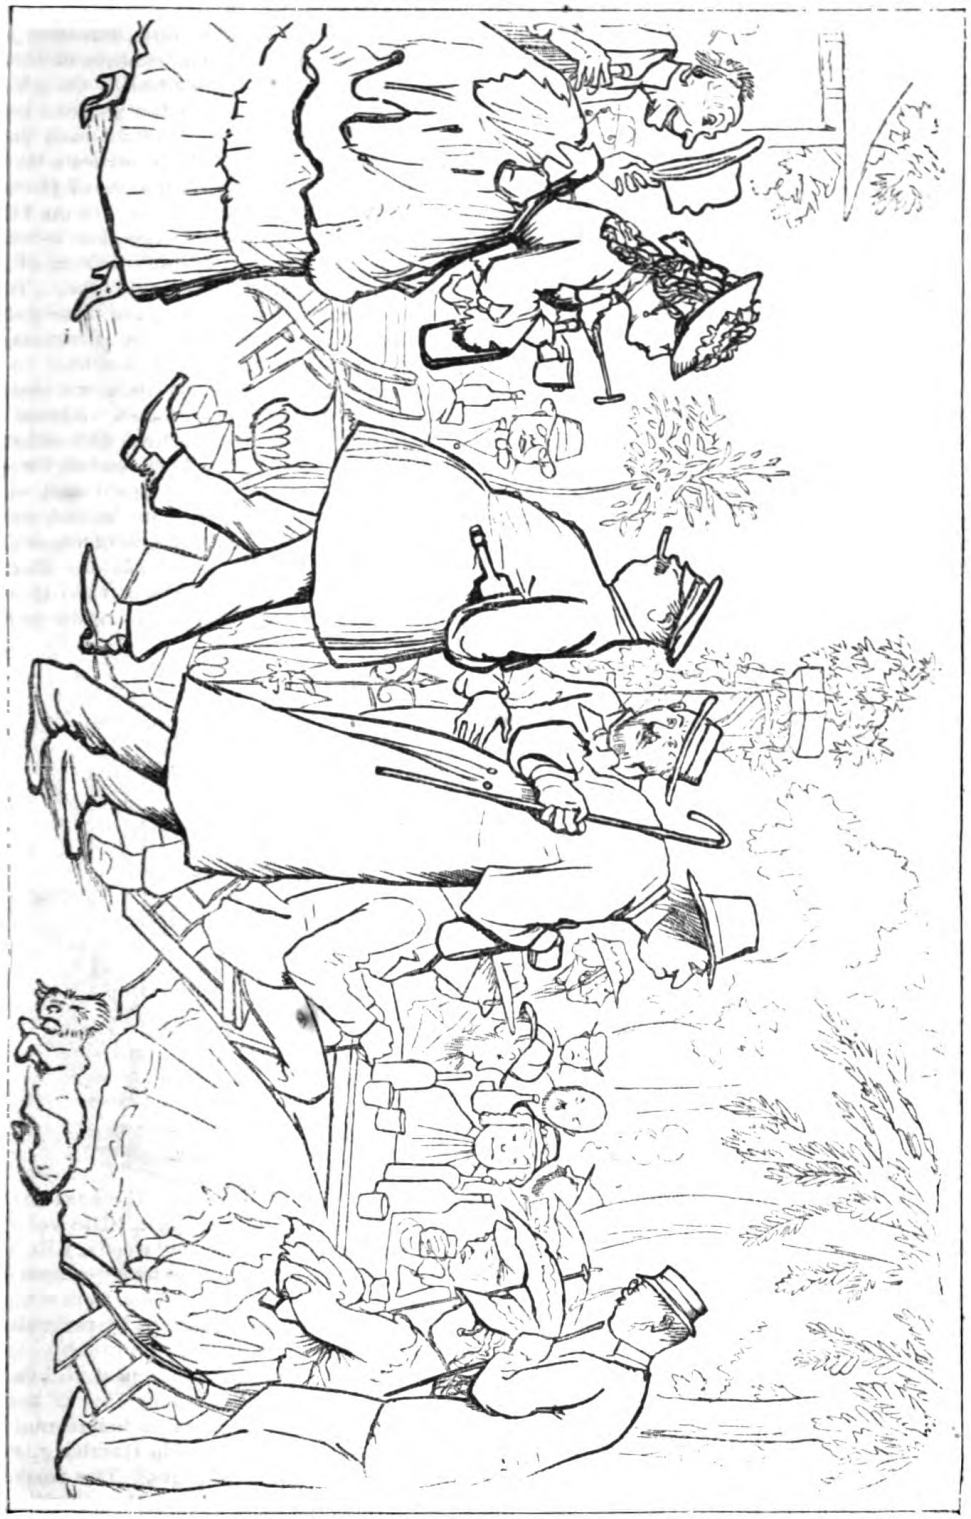
and powerful, with imperial rights and dignities, once the residence of emperors and the seat of the German Diet; the source of almost unbounded wealth in its gold and silver mines, guarded from its watch-towers by trained bands of warriors day and night; a city not only planned and fortified with wonderful knowledge of the science of defense, but set upon a line of hills with such admirable design that it must have been a delightful place of residence in imperial days. A pause of five hundred years, and the old Romanesque buildings—which are still traceable here and there, such as the *Domcapelle*, a relic of the imperial Dom erected by Conrad II. in the year 916—are swept away, and a new element of life makes its mark in Goslar: a period of commercial prosperity takes the place of the more romantic and warlike; the arms and insignia of an imperial city are thrust aside, and guilds and corporations erect town-halls, warehouses, and massive, high-gabled beer breweries. The Gothic *Kaiserwerth* (now turned into a hotel) standing in the central square gives in itself a new character to the city, and bows and arrows give place to more peaceful weapons. A new city is built, so to speak, within the walls of the old; new customs and new sciences are introduced, manufactures are encouraged, and the art of mining and smelting—the source of wealth, the *raison d'être*, it may be said, of Goslar—is carried to such perfection that the world, and the world's wealth, flock hither from all parts of Germany. Schools of mining are established, geological experiments of great scientific importance are carried on, and the little river Gose, which once flowed a wide stream through the town, has its tributaries diverted for mining purposes, and dwindles almost out of sight. Three hundred years more, and the city is asleep. Its population has dwindled away; its mining operations are no longer the world's wonder; its halls are turned into granaries; the walls of its old beer breweries totter and fall; the wooden gables lean; the carved woodwork on its doorways becomes defaced; there is silence in its streets.

"Why is it asleep?" is the natural question; and why should such a grand old city remain untenanted? What is to become of Goslar? Will it, because trade has for the time been diverted into other channels, disappear slowly from the map of Europe, or be once more a populous and thriving city? Forty thousand people living in Goslar in barbaric days, and now only nine thousand! A city dwindling away for want of being known, and several hundred thousands of people reminded of its existence through the pages of an American magazine, in these modern days of enterprise and railway communication! Let us endeavor to sketch its modern aspect, and the welcome it can give to strangers. There is no very good inn in the Harz Mountains, but there is plain, and generally clean, German accommodation; there are always ridiculous little beds, and food which the mountain air renders more than tolerable. Herr Paul, at the inn near the round tower, is an attentive host, who speaks English, and is adapting himself to English habits and customs as far as he has opportunities of observing them. The *Kaiserwerth* in the market-place is the principal inn—a picturesque old building of the fifteenth century, adorned exteriorly with statues of former emperors—and there are several others in the town. The streets are roughly paved, and some not too clean; but the old houses, with their carved frontages and high-pitched gables, fringed with ornament and decorated with grotesque figures, the creepers growing over the closed lattices, the solid brass door-knockers in the likeness of mermaids, satyrs, dolphins, dragons, and griffins, the deep rich color of the time-stained wood, and the peeps of the hills at the ends of the streets, lead the visitor on



OVER THE COBBLE-STONES.

and on, over innumerable and wearying cobble-stones.

To see what are called the "show-places" in the town, the visitor will probably do best to take a human guide, and give himself up to his care for one day. He will then see in detail what we can only indicate here—the relics of a wonderful tenth-century city. He will be shown the remains of the imperial *Dom*, and what is said to be a votive altar of the early Saxons; and what is more interesting, because more authentic, the walls of the ancient Kaiserhaus, erected by the Emperor Henry III. in 1059. Its style is Romanesque, and its proportions and situation make many similar buildings of a later

DRINKING THE WATERS.

date look mean and poor. It is true that we can repeat the best lines in architecture that are the "monopoly of past ages," but we miss almost always the simple grandeur and fitness which are the stamp of ancient work. There are parts of this building, now used as a granary and piled up with rubbish, which are full of suggestion, and worthy of examination, we venture to think, by any architect who comes this way—such, for instance,

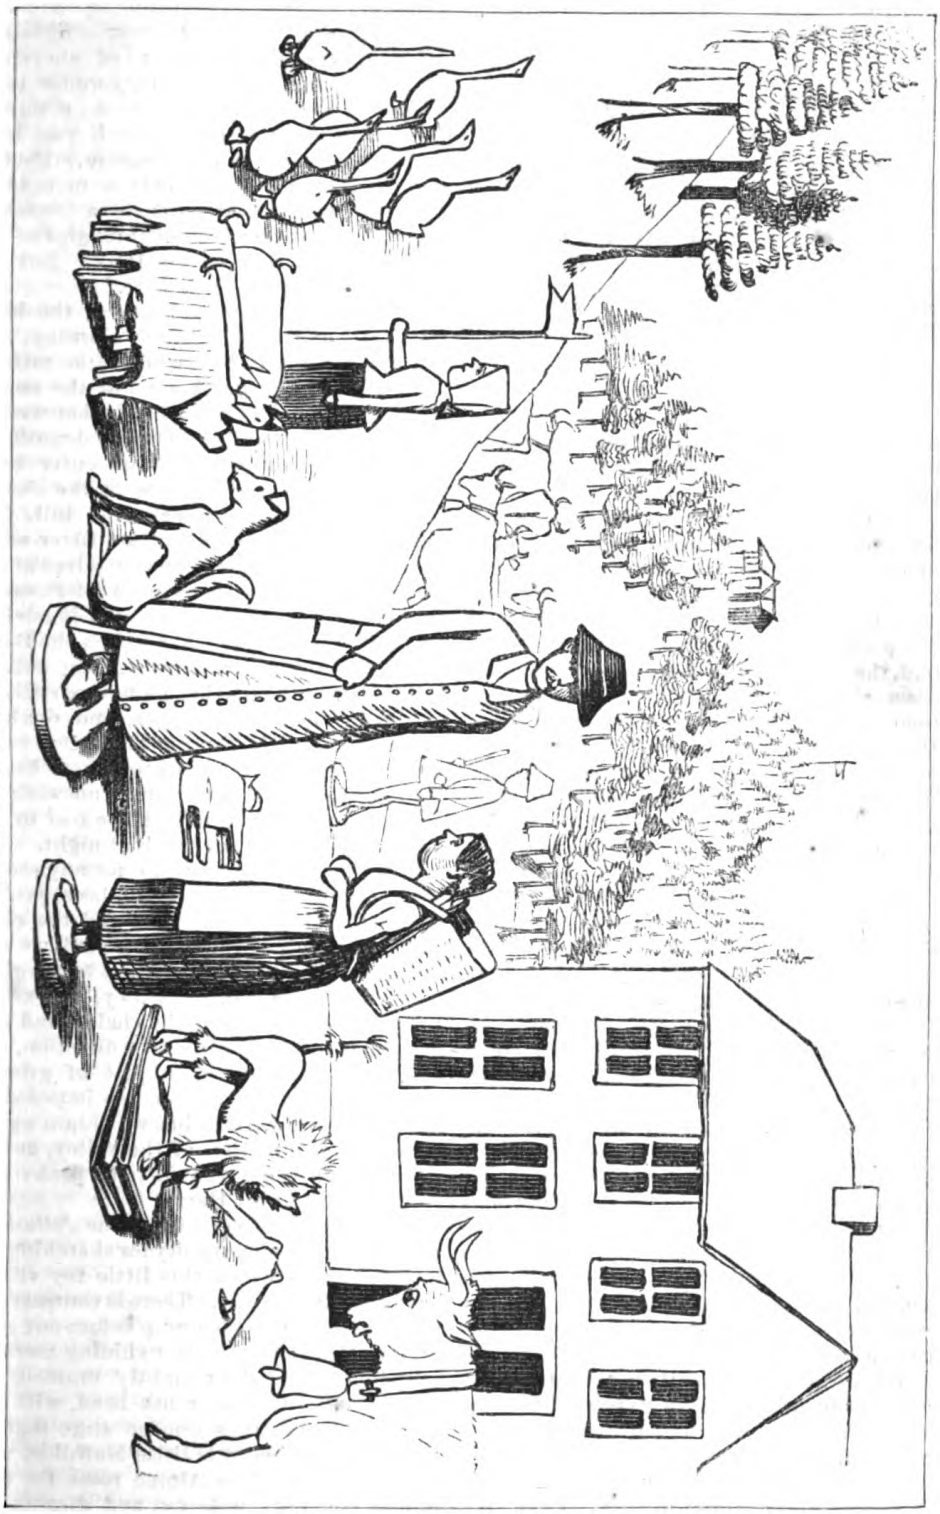
as the arrangement of the windows so as to command the best views and the finest air. In the Rathhaus, on one side of the market-place, there is an elaborately wrought silver tankard of the fourteenth century, with figures and implements in high relief, the expressions on the faces of the figures being wonderfully worked on a small scale. In this, and in some specimens of early stained glass, we are again reminded of the "lost arts" of which we have lately heard so much. If not "lost," these things are certainly fading before our eyes.

The relics in Goslar are not, however, its principal attraction. The visitor will be more struck by the picturesque aspects of its old streets, the variety and grandeur in design of its granaries and dwelling-houses, built of wood and stone, with dark wooden gables and lattices and massive timbers, sharp in outline and well preserved where the stone and brick foundations are crumbling away. The ornamentations of the exteriors of the houses should not be passed over, nor the patterns in the wood carving in the interiors. Here and there we may see, as in Moorish work, the conventional forms of flowers and plants introduced in ornament in the most natural way. Just above our heads, on the front of a small dwelling-house, the ripe fruit and leaves of the Indian corn are carved in scrolls as a fringe to the gables, and grapes and flowers are modeled on the panels. Artists might settle down in Goslar with a summer's work before them of the rarest kind, for, happily for those who are yet to come, it is still almost unknown.

But ancient Goslar has already a fashionable life of its own, and affects, to some extent, the manners of to-day. It does not attempt to compete with Harzburg or the more modern watering-places of Blankenburg or Wernigerode, but it *is* a watering-place, and it has its own particular promenade. Let us come this afternoon and see "life in Goslar," or, in other words, the "procession of the sick." The figures are pilgrims that have come from far and wide to combine the attractions of a holiday with the benefits of a wonderful "cure" for which the town has long been celebrated. The promenades and walks on the ramparts, lined with trees, are crowded at certain periods of the day with valetudinarians, who are going through a prescribed course of getting up early, taking regular exercise, attending strictly to their diet, and generally undoing what they have been steadily doing since their last visit. The fine air and regular habits which are strictly enforced have the natural beneficial effect on the majority, but there are some who require stronger measures, and whose regimen consists in drinking daily several quarts of a dark mixture having the appearance, taste, and effect of taraxacum or senna. The bottles of this liquid are supplied to the patients at the public gardens and little *cafés*, situated at convenient distances in the suburbs of Goslar. The usual time prescribed by the physician under whose control the gardens are managed is about a fortnight for each patient, who takes two or three bottles a day. It is a serious business with some of them, but they generally put a good face on the matter, so that a stranger to the place would merely regard them as holiday-makers of a rather dilapidated and eccentric type. We have sketched the scene at one of these gardens about four o'clock in the afternoon, when the conviviality is at its height.

Among the antiquities of Goslar we must not omit to speak of the mines. About a mile up the valley, in a southward direction, there is a mine that has been *worked for at least eight centuries*, yielding "gold and silver, copper, lead, zinc, sulphur, vitriol, and alum." We repeat the catalogue of minerals as given to strangers who visit the Rammelsberg mine. At the present time there is little activity, as the yield hardly pays the expense of working.



IN HARZBURG.

The situation of Harzburg, the next town on our route, at the head of a little valley, closed in on either side by woods, will remind the traveler of the watering-places of the Pyrenees. It is in a *cul-de-sac*, from which there is no easy escape, except by returning northward into the plains.

As we drive up the valley, past the railway terminus, we pass a long line of scattered cottages of the peasants before reaching the new and fashionable Harzburg, the growth of the last few years. The road is wide and smooth as we leave the old village behind us; on either side are large hotels, out-door cafés, and private, park-like villas, with prettily laid out gardens. Through the gates of one of these gardens the driver turns, and stops at the veranda of a large, noisy hotel. The *Juliushalle* is so celebrated

ON THE BURGBERG.

tobacco, clings to the valley on a summer's night, and quite overwhelms the scent of the pines.

It is evening when we stroll up the valley, and the peasants are returning from the mountains; cattle, sheep, pigs, goats, and geese line the roads, and the people all stop to stare as usual. We have only been in the mountains a few days, but these figures and the lines of fir-trees above our heads seem strangely familiar. Where have we seen these grave peasants in long coats, these wooden-faced women with baskets on their backs, these spotted cows, flat-sided pigs, and uniform geese? Where these formal-looking houses, rows of stiff-looking trees, white, staring dogs, and grave, fat-faced children? It is the child's box of German toys, suddenly opened and turned out before us; the strange impression produced upon a child—who shall say how many years ago?—reproduced in life before our eyes! Here are all the living materials for "Noah's arks" and "Christmas-trees." Noah, with his long brown coat in stiff wooden folds, and his hat and stick, as presented to us in childhood; his wife and family in red, brown, and buff, standing staring vacantly in a row; the shepherd with his horn and gigantic crook, painted green; cows and goats walking home two by two; and pigs lying flat upon the ground, like little toys thrown down. Under the trees, as the sun goes down, our "Christmas-tree" is lighted up, and the figures that move before us only want packing up and selling at two sous each at a child's bazar.

We have called the Harz Mountains the "Toy Country" of North Germany, because it is suggestive at every turn of toys and children. Every mountain we shall ascend is covered with rows of those stiff-looking trees which are carved in wood by the children of the Black Forest and the towns of Germany. Every hill-side is a plantation—hence their formality—and there are complete forests of fir-trees of all sizes, according to the year of growth. The effect is curious on a mountain walk, when, after threading a pathway with Lilliput footsteps through a forest of enormous pines, you suddenly come to a nursery of little trees, a miniature forest, on which you look down like Brobdingnag, stepping at one stride over a mountainette covered with a hundred trees; and so on through the entire tour of the Harz. But we must not anticipate.

There are clouds at the head of the valley next morning, and behind the clouds it is raining on the Brocken; but the sun is so hot by ten o'clock that we are glad to get out of the valley and walk up through the woods, which we enter by a wicket gate nearly opposite to the *Juliushalle*, to the Burgberg, or castle hill, just above the town. In about a quarter of an hour we are surprised to find ourselves at the summit. There are the ruins of a fortress on this eminence, and there is, says Baedeker, a "small but comfortable hotel on the Burgberg, affording a fine view. A flag hoisted in summer indicates that rooms are still disengaged. Guides, carriages, and donkeys can be hired at Harzburg. The ascent takes forty minutes." This announcement brings numerous excursionists from Brunswick every Sunday, who accomplish the feat in one day, returning to Brunswick at night.

Whether it is worth while for any one to walk up to this noisy little beer garden, where the shouts of waiters and the clink of glasses drown every other sound, we will not say. The walk through the woods gives us beautiful peeps of the valley, and we see as on a map beneath us the chalets and gardens that are rising in every direction, and covering every available plot of ground. From the top the view is much impeded by the masses of fir-trees; but we obtain a good idea of the formation of the valley, and in clear weather see the distant peaks and slopes of the Upper Harz.

Under the long veranda of the *Juliushalle* we have ample opportunity for sketching the motley throng which this little toy village has brought together. There is contrast and variety enough in the group before our eyes. Standing in the sun with "shining morning face," her light hair tightly braided, her handkerchief tied over her head, with the stolid face and fixed wooden stare that we know so well, there is little Mathilde, with her basket of white Alpine roses for sale. She is generally welcome, and disposes of her bouquets quickly enough. But she has no more tact than the rest of her race, and is sometimes decidedly *de trop*.

In her round this morning through the café she has disturbed a philosopher at the

THE PROFESSOR.

wrong moment, and is the innocent subject of excited anathemas. The scene is worth recording for the curious contrast of the two figures—the violence of the professor and the stolidity of the girl; while underlying the irritability of the one and the immobility of the other there is a chord of sympathy and a mutual understanding, which we, as foreigners, can not penetrate. If we were not accustomed to such scenes, we should be surprised to find them all together in the afternoon on the common "roundabout" of the country, the professor astride of a wooden horse, and little Mathilde, with a baby in a basket-chair, whirling round and round under the dusty trees to the sound of a hand-organ, the ringing of bells, and the shouting of children.

And what of the ladies that crowd these watering-places, who are sitting about in the rooms leading on to the gardens, and in the summer-houses, reading and chatting over their worsted-work? The younger ones are of the fashionable colorless type which we all know well. They have evidently plenty of money, and have put themselves into the hands of a modiste from Berlin; they have put on whatever they have been told, regardless of whether the color suits them, or whether the pattern of their dresses should be worn by short people or tall, stout or slight. Thus their individuality is gone; they are all moulded to one pattern, in different colors, like machine-made toys; the only vestige of nature is in their almost expressionless faces, in the blue of their large eyes, and in the glimpses of wonderfully fair hair. What is to be said, what description can we give, from such meagre details? The artist is at a disadvantage in every respect; for these dresses have been made so beautifully and packed so carefully that they do not even fall into natural folds, or give the slightest expression or character to the wearer. Moreover, these young girls can neither walk erect nor show any grace of motion. Velasquez was a court painter, and struggled manfully with the stiff hooped dresses of his time, giving wondrous individuality to the hands of most of his portraits; Murillo had easier work in painting picturesque rags and limbs of beggar-boys. Were a great painter in Harzburg to-day, he would find little work to his hand. One head only in all this assembly stands out with marked character and individuality; it is unfashionable and prosaic, but not uninteresting. There is a concert of young people just commenced in the inner room, and a lady who has been working near us stops to listen; we note it rapidly in this sketch, but it is worthy the pencil of Holbein.

A PORTRAIT.

From Harzburg there is a carriage-road to the inn at the top of the Brocken, but the pleasantest way is to drive to Ilsenberg, and then walk, the distance from the latter being about seven miles. The walk is altogether beautiful, through woods, by waterfalls, and under the shadow of great rocks, until the upper and more Alpine region is reached. We pass through open glades and pastures here and there, then into a thick forest of pines, then out again on to the road for a while, following the windings of the Ilse. On our left hand, as we ascend, an almost perpendicular ridge of rock towers over the valley, and we pass a little sign-post which tells us that by a digression of three-quarters of an hour we can ascend the Ilsestein. From this prominence, where an iron cross is shining in the sun about 350 feet above our heads, there are views of scenery wilder and more grand than any thing that can be imagined from below. Continuing the ascent, which changes every moment from rocks and streams to the quiet and solitude of pines and firs—now walking on a carpet of living moss or dead fir cones, now coming upon a little garden of wild flowers, red, white, and blue, under our feet, with red berries, Alpine roses, and blue forget-me-nots, purple heath in the distance, and above our heads mosses and creepers growing round projecting boulders—we come suddenly upon a little plantation of toy fir-trees, from four to six inches high, railed off like a miniature park—a nursery for forests for our great-grandchildren to walk in when the trees above our heads are turned into the eaves and gables of towns. No one touches these plantations, which are to be seen on the mountain-side in various sizes, planted out wider year by year as they grow larger, until they spread into a living forest.

A SCHOOL-GIRL.

Here and there we come upon masses of felled timber, and the encampments of charcoal-burners, with the women hard at work, as usual, with grimy faces, and shawls tied over their heads. And here it is that

NOAH AND HIS FAMILY.

our summer holiday-making parties come face to face with "the slaves of the Harz." A young lady fresh from school in fashionable Berlin (who has come upon a pony) stares with all her eyes at a care-worn woman who has seen no more summers than herself, an "old girl" of seventeen, who has carried loads of wood since she was four, and who knows of no life but labor.

A rest for half an hour near one of these encampments, and we are again ascending, meeting several more barefooted, wild-looking women, who are porters, coming from the Brocken. The path now leaves the stream and all traces of the road, and we enter open ground, up a steep and stony path, across heather and furze, and between great blocks of granite, where there is no track visible; then into more woods, and so by an easy ascent of three hours to the top of the Brocken. The air has been crisp and keen, the sky is almost cloudless, and the aspect of the mountain during the last half hour reminds us for the first time of Switzerland. We are climbing on up the last steep ascent, strewn with enormous moss-grown boulders, which hide the view above us, and are unaware until we are within a few yards of the inn that we have reached the summit of the famous "Blocksberg," the spot haunted by spectres, witches, and bogies from the earliest times.

Here we are in the "Toy Country" again, but this time it is Noah and his family that we see before us. There is, as our sketch will indicate, the identical form of packing-case which the religious world of all nations has vulgarized into a plaything for children. There is the host with his three sons coming out to meet us; the people walking two and two; the horses, sheep, pigs, and goats all stowed away at the great side-doors. The resemblance is irresistible, and more fascinating to our minds than the legends and mysteries with which German imagination has peopled this district. As we ascended from Ilsenberg, every spot of interest on the path, every weather-beaten pine, had some story of witchcraft or devilry attached to it; but the thing is overdone, and in this romantic neighborhood there is too much devilry and blue fire. The traveler who would dwell upon the poetic fancy of Goethe, who would hear in imagination the songs of the spirit-world that haunt this lonely summit, has little chance for reverie. The atmosphere is too theatrical and forced from beginning to end, and he will be more likely to find himself, on arrival, listening by force to some holiday-making members of Gungl's band, recalling the Faust of the stage, or Mephistopheles descending through a trap-door in a blaze of fire.

The sun is setting upon the weather-beaten walls of our house of refuge, and shining across the far-off plains as we arrive. The sky is clear overhead, and the drifting white clouds that floated round at intervals during the day now settle down in the dark valleys like little snow-fields, and rest among the branches of the pines. The sun is burning upon the distant town of Halberstadt, while the villages beneath us are all in gloom. Before us, in the far distance, there are little specks dotted on the plains, which indicate (we are told) the towns of Brunswick and Hanover; and nearer to us, just beneath, is the valley of Harzburg and other watering-places of the Lower Harz. Turning to the southwest, the upper district, where the positions of Andreasberg and Clausthal can be just discerned through the rising mist, we see a variety of pine-covered summits in undulating line. The view northward, so much spoken of, is the least interesting part, because, although you may with a telescope, from a tower a few feet above the inn, "just see Hamburg," there is little more than a speck to be made out on the clearest day.

Of the "bogie" which haunts the Brocken, the famous optical illusion which, under certain conditions of the atmosphere, reflects figures of enormous size on the clouds, we can only speak by hearsay, as it is seldom seen—but once or twice during a summer. The "spectre" is said to appear at sunset, or "whenever the mists happen to ascend perpendicularly out of the valley, on the side opposite to the sun, and leave the mountain-top itself free from vapor. The shadow of the mountain is reflected against the perpendicular face of the rising vapor as it were against a gigantic wall. The inn then becomes a palace in size, and the human beings on the summit become giants." This spectre and the dance of witches on the eve of May-day are the two "associations of the Brocken" which no traveler comes away without hearing of, nor without having pointed out to him the great granite blocks

SPECTRES OF THE BROCKEN.

called the "Witches' Altar," the "Devil's Pulpit," and other monuments commemorative, it is said, of the conversion of the early Saxons to Christianity. The ordinary aspect of the Brocken is described in a few words by Andersen. "It gives me," he says, "an idea of a Northern tumulus on a grand scale. Here stone lies piled on stone, and a strange silence rests over the whole. Not a bird twitters in the low pines; round about are white grave-flowers growing in the high moss, and stones lie in masses on the sides of the mountain-top. We were now on the top, but every thing was in a mist; it began to blow, and the wind drove the clouds onward over the mountain's top as if they were flocks of sheep." And thus it is in a few minutes with us. In less time than it takes to write these lines the whole aspect of the mountain has changed, the clouds have come up from the valleys, and we are under a veil of mist. Here and there it has cleared for a moment, and revealed to us the only "spectres of the Brocken" we ever saw during our stay—sad, wet, and weary travelers waiting for the view. Another minute and they disappear in the clouds, and the strains of Gounod's music coming from the *Brockenhaus*, and the sounds of voices and the clinking of glasses, make us beat a retreat. The transition to the scene within is as startling as a transformation scene in a pantomime, and almost as grotesque. Here are at least sixty people crowded together—English, Americans, French, Spaniards, and Germans, the latter already hard at work on the viands which the slaves of the Harz had brought up from the valleys on their backs. The accommodation for travelers is, of course, rough and plain, but we are all sheltered from the pitiless storm outside, and are kept alive until the morning.

The day breaks and the sun rises over the plains of Europe, while we sixty travelers are enveloped in mist. There is a view at sunrise here once in a summer, which those who have not slept on the Righi or Mount Pilate, in Switzerland, describe as surpassingly beautiful. It is a relief to descend again into the region of sunshine, to walk across green pastures, and in moss-covered woods, to rest by picturesque water-falls, and hear the thunder of the stream, swollen by the clouds that we have left behind us. It is a beautiful romantic walk by the foot-paths down to Wernigerode; we meet hardly any travelers but the charcoal-burners and woodmen for the first two hours, when the path by the stream, winding out be-

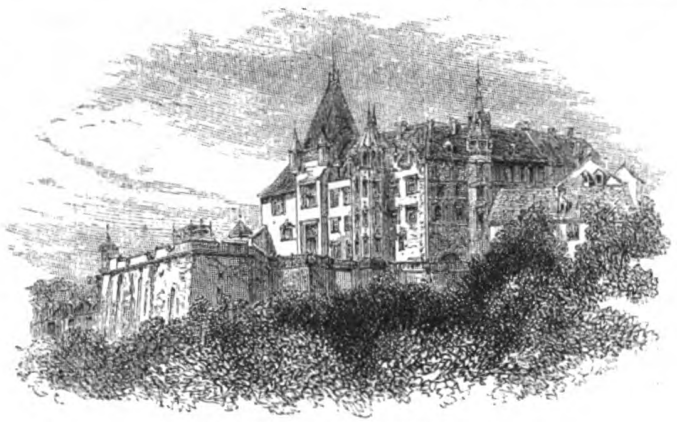
THE POINT OF UNION.

tween the granite rocks, crosses a rough wooden bridge, and we come suddenly on two figures that have a familiar aspect, and soon we find a café, and a little bazar for the sale of photographs, crystals, and the like. There are about twenty Germans reposing after the labors of the climb to this spot from Wernigerode (they have left their carriages a few feet below), and various restoratives are being applied by the host in the kitchen of his wood cabin. From hence through Hasserode to Wernigerode we meet more holiday groups than we have done on our travels.

It is a sudden change to civilization to approach Wernigerode from the mountains. On descending from the Brocken we are scarcely prepared for a macadamized road a mile long, lined with modern villas and pleasure-gardens, and to see fine carriages and horses, and people driving about in the fashions of Berlin. But changes are being made rapidly at Wernigerode: the castle and beautiful park, with its woods that skirt the northern slopes of the mountains, remain, but the property is passing into Prussian hands, and the old town itself, which was modernized after the fire in 1844, will soon lose its antique character. It is a spot much too delightful and healthy as a residence, and altogether too valuable, in the vicinity of such beautiful scenery, to escape this fate; and no one but the antiquary or the artist need regret it, for with railway communication, and good roads and walks, it is one of the best situations for a residence during summer. There are a few fine old timber houses left, and the Rathhaus that we have sketched on the market-place, in the front of our hotel windows, is both picturesque and curious.

The fine broad road by which we leave the town on our way to Elbingerode is lined with people promenading on this fine summer afternoon; there are girls' schools, loungers, and ennuyées, fashionable equestrians, and numerous handsome carriages, but none of the walking parties that we see elsewhere in the neighborhood of mountains, and very few knapsacks or dusty pedestrians.



There is a good carriage-road to Elbingerode, past which, with its hard-working and dingy population, through the valleys where the smoke hangs over us, and the fumes from the mines seem to blight the land, through dreary valleys, with strange forms of rocks on either side, we come in about three hours to the village of Rübeland, deep in the gorge through which runs the river Bode. Here, as at Elbingerode, there is no thought of natural beauty, and the valley is picturesque in spite of its inhabitants. The general aspect is of work, smoke, and the grinding of machinery, and the people, from their appearance, might have come from Staffordshire, in England. On a fine summer's day many visitors come to see the celebrated stalactite caverns, and give Rübeland for the time a holiday aspect. In front of the inn (the "Goldener Löwe") there are numerous carriages and guides to conduct visitors to the caverns; in short, Rübeland is turned

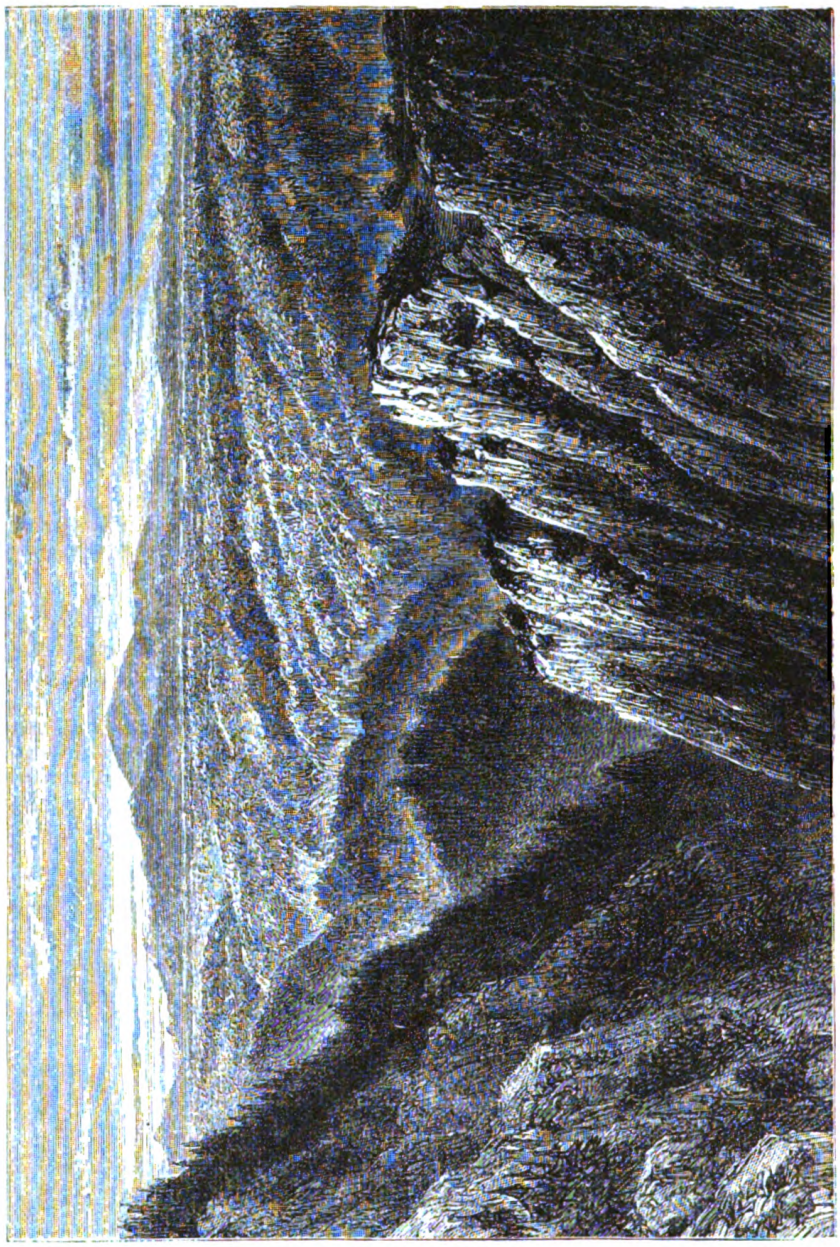
into a show-place during three months in the year. Every traveler who drives through this sombre valley is stopped at the door of the inn, and a waiter, in the full-dress of civilization, is ready to receive him; his thoughts are turned at once from the romantic aspect of the valley, from the spots immortalized by Goethe and Schiller, to the most prosaic associations; and it is well to abandon himself at once to the situation, for in Rübeland there is no escape. "To dine, and see the caverns lighted by Bengal-lights," is the programme for all.

THE SCHLOSS, BLANKENBURG.

These stalactite caverns, which extend for long distances under the limestone rocks at Rübeland, assume the most fantastic shapes, and when lighted up are a wonderful sight. The principal caves shown to visitors are the *Baumannshöhle* and the *Bielshöhle*, the former a natural cavern, discovered more than 200 years ago. It is now entered by an opening cut in the rocks, 144 feet above the village, through which visitors descend by spiral staircases and ladders. The finest stalactites have long been removed from Rübeland, and it is only here and there that we get a glimpse of those wonderful colors which have inspired German poets of all ages.



Passing up the valley of the Bode, leaving the black iron-foundries and ochre mines, we soon arrive at a bleak, flat tableland, where the air is keen and fresh, and, in about two hours after leaving Rübeland, turn off suddenly from the high-road to a spot where a view bursts upon us as unexpected as it is beautiful. We are at the Ziegenkoff, on the heights above Blankenburg, a promontory 1360 feet above the

THE BROCKEN FROM THE HEXEN TANZPLATZ.

plains, with an uninterrupted view looking northward and eastward, which may be fairly called "one of the noblest in the Harz."

The plateau of mountains on which we have been traveling here ends abruptly; it is the end of the upper world, but the plains seem illimitable. It is about an hour before sunset when we arrive at the spot from which we obtained the view outlined on the previous page; the air is still and the sky is clear, with a few little clouds over the plain and on the hills behind us, obscuring the sun's brightest rays. There is nothing between us and Berlin, nothing to impede the view, which is too extensive to describe adequately in this article.*

The more immediate foreground of this view, and the features that give character and interest to it, may be gathered from the sketch. There is the castle, or Schloss, on the heights, the town of Blankenburg at our feet, the strange wall of rocks, with their goblin histories, which crest the hills in the middle distance, the curves of the valleys, the smooth pastures, the undula-

THE WAITER'S GREETING.

ting woods, and the roads winding away across the plains. Its central point of interest is the church spire, with its cluster of houses spreading upward to the protecting walls of the château, with its massive walls and terraces fringed with trees. There is the most exquisite variety of forms in their curves and windings, which are worthy of study, if only as suggestive of feudal times, when the feeling of support and protection from the castle was a natural expression of the people, and not, as now, only a picturesque effect.

Descending to the town, we find the streets of Blankenburg as rough and ill-paved as any artist could desire. The buildings are most interesting; there is something to study in the exterior of nearly every house, and the outline is varied in every gable. The perspective down the steep streets near the old market-place, which is almost under the walls of the castle, is full of variety and color, and the figures of the market-women have a more picturesque aspect than in any other town in the Harz. Blankenburg, as we said, is old-fashioned and "homely," and we are introduced at the *table d'hôte* of the principal inn to some characteristics of the country. Opposite to us, for instance, is seated a general in the Prussian army, whose appearance on parade is imposing enough, and whose information and tone of conversation on acquaintance are rather belied by his attitude and appearance when preparing for a charge on the "Mittagsessen," the event of the day in time of peace.

There are many curious customs to be studied at the table of the "Weisser Adler," where the host shows us with pride the list of distinguished strangers who have enjoyed his hospitality.

Thale, the next place on our list, is neither a town nor a village: it is a place which it is almost impossible to describe satisfactorily, and about which no two people are agreed. The guide-books speak of it as the terminus of the Halberstadt Railway, and, indeed, it is little more. The railway passes the actual village of Thale without stopping, its terminus being a mile higher, at the head of the valley, close to a large modern hotel, standing in its own grounds. There are promenades laid out, avenues of little trees, and a few summer-houses springing up in the modern Thale, and there is an aspect of town comfort and convenience, including carriages of the last Berlin pattern, which take the traveler by surprise—an air of civilization quite inconsistent with its immediate surroundings of smelting-works on one side, and bold rocky scenery and dreary-looking moraine on the other. The mountains which close it in are beautifully wooded, and preserved, as usual, but Thale itself is little more than what is stated in Baedeker (*Hotel Zehnpfund. Rail. Restaur.*).

There is so little to see in Thale, excepting the inn, that we may at once ascend the mountain on the opposite side of the Bode, through a wood, to the famous rock called the Rosstrappe, an almost perpendicular ridge of granite, which stands out like a wall, and hems in the entrance to the valley. There is a path to the most projecting point, which commands a view up and down the valley of the Bode, with its gray rocks and trees overhanging precipices, its waterfalls and its dark recesses, and beyond, toward Treseburg, mountains rising one behind the other, covered with trees. The Rosstrappe is scarcely 1400 feet above the sea-level, but its shape, like a narrow wedge, and its isolated position, with sides descending almost perpendicularly beneath us, render it one of the most striking sights in the Harz. The romantic legend of a princess having leaped across this valley is learned by heart by every visitor, and the proof of the feat is shown in the marks of a gigantic horse's hoofs on the rock! We will not attempt to describe the grandeur of the view from the Rosstrappe, because immediately

opposite to us is another eminence projecting into the valley, from which it is even more remarkable. The valley is crossed by a precipitous descent of 800 feet, and by an ascent on the other side by a staircase cut in the rock with 1100 steps, to reach the "Hexen Tanzplatz"—the platform of rock from which our drawing is taken. The immediate foreground of the view is, of course, an inn, where an artist might well take up his summer quarters; and in little nooks and natural recesses of the rock he will, if a figure painter, find many subjects for his pencil, especially the groups of thirsty natives sitting with their

THIRSTY NATIVES.

backs to the view that they have come many miles to see. He will be continually disturbed in the middle of the day by a holiday crowd, and by much singing, shouting, and the firing of guns to disturb the echoes; but the sunset over the valley of the Bode in the evening light, when the clink of glasses is over and the holiday-makers have gone down the hill, is a sight and a sensation never to be forgotten.

There is a romance about the name and associations of the Harz that we all feel instinctively at a distance; but it is only when we come into districts like these that we realize the poetical aspect of the Harz Mountains, and understand their being chosen as the seats of the goblin literature of North Germany. We have seen, during the last few days, forms of rocks more wild and grotesque in outline than any thing in Doré's dreams; and here before us this evening—across a dark chasm so deep and distant in its recesses that trees and woods look like little clumps of moss set in the recesses of a stone—there is spread before us a view so extensive and varied in outline that neither pencil nor pen can depict its beauties. Immediately before us there is an amphitheatre of mountains, clothed as richly with trees as the preserves of a private park; and stretching away beyond there rises wave after wave of foliage glowing in the evening sunlight, and a further horizon of golden mist, through which we see the Brocken, exaggerated in height and apparent distance by the mist (as its grandeur is exaggerated in story) and by the clouds that ever surround it. Stand still on the rocks just behind the inn, and watch the transformations as the sun goes down; see its slanting rays lighting up the highest rocks near the Rosstrappe, the bright gleams that cross the valley hiding the intervening mountains, and leaving the Brocken soaring, as it were, in mid-air. Wait a few moments more, and the Brocken disappears in a cloud of rain, while the tips of the beech and fir trees are still tinged with gold, and the valley beneath us is in deep gloom.

Turn from this dark abyss—over which the rocks stretch out their fantastic arms—to the broad plain on our right hand, where cities and villages, far away down the valley of the Bode, are in full light of day, and the heavy rain-clouds that will settle upon Thale presently are casting shadows for miles across the distant fields. Watch the glow-worm lights of a town three hundred feet below; hear the bells of the goats, the "jodel" of the herdsmen, the rush of water, and the distant thunder echoing near the Brocken.

See this view at sunrise and sunset, and in its various aspects of sunshine and storm, before reading what Ruskin says of the Harz Mountains in *Ethics of the Dust*. "I have done myself much harm already," he says, "by seeing the monotonous and heavy form of the Brocken; but whether the mountains be picturesque or not, the tricks which the goblins teach the crystals in them are incomparably pretty." We can wish for nothing better for the credit of the landscape of the Harz than that Mr. Ruskin should see this view, and the one from Blankenburg of which we have already spoken.

At Thale the tourist who is merely passing through the Harz district may leave the mountains, with the knowledge that it is in this neighborhood that its beauties culminate; unless he is going southward, when it will be well to drive through Gernrode to Ballenstedt, where there is a railway station. The pedestrian who wishes to make a complete tour can work his way from Thale westward to Clausthal on foot (see map, page 68). It will take at least two days, for there is great variety in this walk, and the geologist or the botanist will be especially rewarded. The extraordinary forms of some of the masses of rock; the precipitous sides of the valleys, with trees growing on their walls, apparently without soil, one above the other; the park-like aspect of some of the breaks in the pine forests; the variety of trees—beech, oak, birch, sycamore, and chestnut, with beautiful varieties of ivy on their stems; the density of the growth in places where, if the path is

A CLAUSTHALER.

missed, it is often necessary (but illegal) to cut through with a hatchet; the sudden and unexpected views that are obtained; the mosses and wild flowers that abound and have never been thoroughly collected—are attractions to the pedestrian, who may wander for a week without meeting a fellow-traveler, and find plenty of occupation with a sketch-book or a geological hammer.

At Clausthal we are in a district where the whole business and interest of the population are under-ground. There are bright green fields, beautiful pastures, old-timbered houses in gardens full of flowers, with their red-tiled roofs, with creepers twining round them. There is sweet air from the mountains, and such freshness in nature overhead that the aspect of the human population filing down the paths in a long black procession, like some accursed race, throws a gloom over the landscape this morning which it is difficult to shake off. Bleak, barren, and gloomy, "a city of perpetual rain," built on an elevation where corn ceases to ripen, where storms make havoc, and where there is no protection from the winds—a long, straggling, wooden town, built on the top and slopes of a hill, the houses roofed and their sides covered with slate for protection—a town with "a desolate look about it," which no one should visit excepting on some serious errand. This is the almost universal description of it, varied a little by accounts of the miners' *fêtes*, of the home life behind these dark timber dwellings, and of the doings of the young students who come from Germany, England, and America to learn mining practically in the government schools, and who winter at Clausthal.

But we are looking at the bright side of Clausthal. It is the finest summer morning of the year: the sky is clear, the distant mountains are in full view, and down the long wide streets the houses rise and fall in picturesque perspective until they end in fields of brilliant green. There is plenty of color and contrast: the red tiles relieve the gray roofs and dark walls; over the doorways and round the houses (some with beautiful carving on their beams) there are innumerable creepers, and crisp bright mountain flowers decorate the windows and gardens. The streets are nearly empty, and these little weather-beaten wooden houses, sprinkled thickly on the rise and fall of the hills, resemble nothing so much as a fleet of fishing boats at anchor off the shore. It is like the long groundswell of a subsiding sea, on which there rides grandly—old and battered, its paint worn off, its beams strained, its figure-head pointed eastward and glittering in the morning sun—the "Ark of Refuge" of the little fleet that surrounds it, the wooden church of Clausthal. It stands high above the houses in the principal square, the little windows in its wooden sides giving it a strange appearance for a church. It was burned down in 1844, and at once reconstructed with the materials nearest to hand. Its design is simple enough: add a spire to the child's Noah's ark, place it in the rain until the paint has been washed off, and there is the wooden church of Clausthal.

Opposite to the church there is the chief object of interest to visitors, the Bergsschule—the government school of mines and the museum. It is here that several hundred pupils from all parts of the world are gratuitously instructed in mining operations, having in the course of their studies to practice under-ground—every pupil having to learn the use of miners' tools, and *work with the men* for a certain time in each operation. In the museum there are models of the machinery used in the mines, miniature shafts and galleries—in short, the whole under-ground life of the Harz Mountains is here presented to us in the easiest way. There is a very fine collection of minerals, classified carefully, and within easy reach for reference. The models of machinery, of the trucks, and of the different smelting processes are all movable and made to scale, so that a morning's study in the museum gives the uninitiated a much clearer idea of the working at Claus-

AT CLAUSTHAL.

PREPARED FOR THE DESCENT.

thal than a visit to the mines. Nearly all the operations are carried on by water-power, and every spring and river in the neighborhood has been diverted for that purpose.

In order to descend the mines at Clausthal, visitors have to divest themselves of the costume of ordinary civilization, and be arrayed in the cast-off suits of the miners, which are left at the entrance of the mine for the purpose. As we approach the mouth of the shaft, where the miners are waiting with lanterns to commence the descent, our party—consisting, it may be stated, of four Englishmen—a professor of geology, a director of mines, an editor, and an artist—present the somewhat undignified aspect in the sketch.

With lantern in hand, we commence the descent by steep ladders for about five hundred feet. The shaft is small, but well ventilated, and at intervals we rest on a wooden platform, where we can see down dark side galleries, and hear the miner's "pick" at work. We pass along narrow galleries, which are in reality water-conduits boarded over; the walls are streaming with water, and there is scarcely room to creep through. Leading out of these at right angles along darker passages, we find a party of work-people, men and women, resting in a cavern. They are scarcely distinguishable in the uncertain light; but on the arrival of our party with more lanterns there is a flashing light here and there overhead from specks of silver ore, and a glitter of human eyes. The figures scarcely move, but they make a curious half-hollow sound, and all mutter the words "Glück auf" to the stranger. It means, literally, well out of the mine, or "good luck to you," but it means also "backshish"—the universal cry of the human creature wherever the traveler finds him, whether burrowing two thousand feet below the surface or clambering ten thousand feet above it.

There is little information of a scientific nature to be gathered in the hurry of these under-ground wanderings, and to those who have visited mines in other countries we can hardly recommend a visit. It is a fatiguing march of about three hours in dark wet passages, and during the greater part of the time there is nothing to see but the wet heels of a miner, and the glimmer of his lantern overhead. At certain points the visitor is shown some crystals or some bright specks of ore, which are dislodged and presented to him as a memorial of the visit; at another place he has pointed out to him the enormous timber-works which have been constructed to support the shafts and galleries, the pumping apparatus, and the perfect system of ventilation. Lamps are carried about uncovered, and a mass of tow is lighted without risk at one place, and thrown down a shaft to show its enormous depth: the effect of this as the fire floats down, lighting up the sides of an apparently bottomless pit, is worth seeing; but the sudden firing of guns in the narrow galleries to awaken the echoes startles us to a consciousness that we are, as usual, making a show-place of a mine in which there is much serious work. The population of Clausthal is about ten thousand, and of these there are at least a thousand under-ground. If we follow the tunnels, we shall come to the smelting-works already spoken of, where the trucks of loose wet soil are wheeled, and the rubbish, as it appears, is made to yield up its riches. In these processes of crushing, washing, sifting, etc., at least another thousand people are employed, and in the neighboring town of Zellerfeld the same works are being carried on.

We should mention the "man-lift" used on our upward journey. This elevator, or "man-lift," which is also in use in Cornwall, in England, and other places, is worked by water-power, and is an ingenious substitute for the ordinary rope and bucket. An enormous crank, working slowly, raises and lowers two continuous beams alternately, and the miners, by *clinging to the ascending one*, are raised to the surface with comparative ease.

One of our last days at Clausthal is "the day of Sedan;" the whole town is *en fête*, and no one goes under-ground. Every house is decorated, and the Prussian tricolor is flying on the dark timbers of the houses. From windows full of flowers there are red, white, and black streamers, and the streets are festooned across with flowers and devices, with

the word "Sedan," and gigantic portraits of the king, Bismarck, and Count Moltke. It is a great day, and a great occasion to enjoy the hospitality of the inhabitants of Clausthal, and to see what charming interiors there are under those dark, weather-beaten roofs; what delightful rooms, with carved furniture, snow-white curtains, old embroideries, shining silver ornaments, lace-work vases and plates made of iron, wrought into the most delicate and beautiful open-work patterns, this last a specialty of the Harz.

Across the bright, fresh fields again, leaving Clausthal and the great smelting-works in the valley which they desolate—a walk on springy turf across sweet pastures, through park-like little forests and deep glades, between regiments of silent pines over hill and dale for six miles, brings us to the brow of a hill, from which we first see Grund.

In the midst of a series of what we may call "mountainettes," tinted with the most delicate gradations of gray, we see sloping woods and fields, set with bright, red-tiled gables and glittering spires, and little paths leading from them, with processions of goats and cattle coming down, led by toy shepherds (of one of whom the central figure in our illustration on page 73 is an exact portrait), and hear the tinkle of innumerable bells and the distant mountain-horn. This is our first impression of Grund. Winding down into the irregular streets, where old men and women are seated about, and the cattle that have parted from the droves are gravely walking in at the front-doors of their houses, unattended, we stop at the principal inn, in front of a market-place, which occupies a few yards of open level ground in the middle of the town. The view is limited from the windows on the front; the valley and the curtains of trees above and below shut us in from the outer world, and give, it must be confessed, a rather close feeling to one of the loveliest mountain villages in Europe. We are encompassed by rocks and streams and trees; and when the clouds come down and shut off our view of the blue sky, we begin to think it can scarcely be as healthy for invalids as is generally supposed. We are comfortably housed at Grund, but even in this retired valley there is no peace to-night. Here, as at Clausthal, the people have been keeping the feast of Sedan; they appear to go to bed at three, and to rise at four. As the last villager goes home to bed he meets the first cow on its way to pasture; as the last song dies away we hear the tinkle of bells and the summons of the mountain-horn.

The town has the most pastoral appearance of any in the Harz, although many of the inhabitants are engaged in the neighboring mines. There is but one good inn ("Rathskeller"), which in the summer is

THE "MAN-LIFT."

crowded with visitors, who come to take the pine-baths for which this valley has, in spite of its visitors, an old reputation; but it is altogether more rustic and simple in appearance than any village of the same importance in the Harz. English or American travelers are seldom seen at Grund, and the habits of the visitors at the inn are, in all respects, German. The *Rathskeller* is the market-house, town-hall, and centre of all the judicial business of the district, so that at certain seasons the scene from the gallery of the old inn is very animated, and the gatherings of the village magnates round the fire in autumn evenings a sight to be remembered. The inn is a rambling, spacious building, with remnants of the original structure (anno 1675) still remaining; it has been greatly enlarged, to accommodate the crowds of travelers who pay it a flying visit. Grund has a great reputation for its scenery, its whey cures, and its baths, and it has also a reputation for rain. The impression of half the visitors to Grund is of a valley filled with vapor, of a damp-looking little inn, with streams pouring from above on all sides, but of an interior warm and spacious, with large wood fires in June, and plenty of spiced beer.

Let us endeavor to picture it to the reader as we last saw it in 1872. In a deep cleft in the mountain-side a stream descends, winding in and out between overhanging trees, now disappearing in some crevice, now descending almost perpendicularly, now spreading out right and left, but ever following the form and structure of the mountain down which it pours. It is a stream of red-tiled cottages, with dark gables, shelter-

ing atoms of human life—a mountain village, as bright and glittering as a stream of water winding its way through green pastures, between gray rocks and waving trees. This is its distant aspect on a fine summer's evening in 1872, before the railway, which is already making beneath our feet, is completed, and the kitchen of some "Grand Hotel" sends its smoke up the valley.

After visiting Grund there is no prettier or more delightful way of quitting this district than through the valley northward to Lautenthal, and then to Seesen, where the system of railways is reached again. To the general question, "Are the Harz Mountains really worth visiting for a short summer tour?" we must answer, "No," if by so doing the traveler should miss seeing Switzerland, or even the Alps of Southern Germany. It is not a place to recommend English or American travelers to visit without some special purpose. The artist would do well to come straight here from the nearest seaport, and spend a summer in the neighborhood of Thale and Rübeland. He would never regret it, because he could work *unmolested*, and bring home a portfolio of drawings of scenes unknown to the greater part of the world. With a knapsack, a little knowledge of German, and a few thalers, he could spend a summer more useful, peaceful, and delightful than could be imagined from a visit to more crowded places; and we may remind him that the Harz is *not* a black country, as is generally supposed—it is really no more desolated or disfigured by mining operations than the green fields of the south of England are affected by the smoke of Staffordshire; and that in the beauty of its forests, the forms of its rocks, in the romantic aspects of its scenery, it is still almost a *terra incognita*. As a land of bogies, tradition, mysteries, smoke, and blue fire, it is familiar to children of all ages and nations. But the romance of the Harz is in books and dreams, and at far-off firesides; in a holiday scamper, or in a sketching tour, the legends attaching to the district are felt rather as an intrusion, and disturb the quiet appreciation of its beauties.

OLD KENSINGTON.

By MISS THACKERAY.

CHAPTER LIII.

THAT THOU ART BLAMED SHALL NOT BE THY DEFECT.

ONCE, as Dolly was hurrying away through the passages to the great front entrance, she looked back, for she thought she heard Robert's step coming after her. It was only Casimir, the servant, who had been loitering by a staircase, and had seen her pass. She came to the great wide doors of the music-hall, where the people were congregated, the servants carrying their mistresses' carriage cloaks over their arms, the touters and vendors of programmes. The music was still in her ears; she felt very calm, very strange. Casimir would have darted off for the carriage if she had not stopped him.

"Is Mademoiselle indisposed? Shall I accompany her?" he asked.

But although Dolly looked very pale, she said she was not ill; she would go home alone: and when she was safely seated in the little open carriage he called for her the color came back into her cheeks. She leaned back, for she was very tired. As she drove along she tried to remember what had happened, to think what more would happen, but she could not do so. It was a feeling, not an event, that had moved her so; and the outward events that relate these great unseen histories to others are to the actors themselves of little consequence. As for the future, Dolly could scarcely believe in a future. Was any thing left to her now? Her life seemed over, and she was scarcely twenty: she was sorry for herself. She did not regret what she had done, for he did not love her. It was Rhoda whom he loved—Rhoda who seemed to have absorbed every thing, little by little. There was nothing that she had spared. Dolly wondered what they would say at the Court. She thought of Frank Raban, too. If the squire's news was true, Frank Raban would be thinking no more of her, but absorbed in other interests. Even Frank—was any one faithful in life? Then she thought of George: he had not failed: he had been true to the end, and this comforted her.

Every thing seemed to have failed with

her, and yet—how shall I explain it?—Dolly was at peace with herself. In her heart she knew that she had tried, always tried, to do her best. No pangs of conscience assailed her as she drove home through this strange chaos of regrets and forgetfulness. Her hands fell into her lap as she leaned back in the little carriage: it was bringing her away through the dull rattle of the streets to a new home, a new life, swept and garnished, so it seemed to Dolly, where every thing was strange and bare—one in which, perhaps, little honor was to be found, little credit. What did she care! She was too true a lady to trouble herself about resentments and petty slights and difficulties. They had both meant to do right. As for Rhoda, Dolly would not think of Rhoda just then; it hurt her. For George's sake she must try to think kindly of her; was it for *her* to cast a stone? Dolly came up stairs slowly and steadily, opened the door, which was on the latch, and came in, looking for her mother. Miss Vanborough had never, not even in the days of her happy love, looked more beautiful than she did as she came into the little sitting-room at home. A light was in her face; it was the self-forgetful look of some one who has passed for a moment beyond the common state of life, escaping the assaults of selfish passion, into a state where feeling is not destroyed but multiplied beyond itself. In these moods sacrifice scarcely exists. The vanities of the world glitter in vain, discord can not jar, and in the midst of tumult and sorrow souls are at peace.

Mrs. Palmer was not alone; the squire was there. He had brought news. He had been detained by a peremptory telegram from Norah—"*Jonah arrives Paris to-morrow; mamma says, remain; bring Jonah home*"—and Jonah, who had come almost at the same time as the telegram, had accompanied the squire, and was waiting impatiently enough, hoping to see Dolly. He had been somewhat bored by the little elderly flirtation which had been going on for the last half hour between his aunt and his godfather (which sort of *pot-pourri*, retaining a certain faint perfume of by-gone roses, is not uncommon); but he did not move, except to go and stand out upon the balcony and stare up and down the street; he was leaning over the slender railing when Dolly came in, and so it happened that at first she only saw the squire sitting by her mother's easy-chair. She gave him her hand. He stood holding it in his, and looking at her, for he saw that something had happened.

"Alone!" said Mrs. Palmer. "Is Robert with you? I have some news for you; guess, Dolly;" and Philippa looked archly toward the window.

Dolly looked at her mother. "I left them at the concert," she said, not asking what the news was.

"What made you leave them? Why do you stare at me like that?" cried Mrs. Palmer, forgetting her news. "Have you had another quarrel? Dolly, I have only just been saying so to Mr. Anley; under the circumstances you really should *not*—you *really* should—"

"It has all been a mistake, mamma," said Dolly, looking up, though she did not see much before her. "Every thing is over. Robert and I have parted, quite parted," she repeated, sadly.

"Parted!" exclaimed the squire. "Has it come to this?"

"Parted!" cried poor exasperated Philippa. "I warned you. It is your own fault, Dolly; you have been possessed all along. Mr. Anley, what is to be done?" cried the poor lady, turning from one to the other. "Is it your doing or Robert's? Dolly, what is it all about?"

Dolly did not answer for an instant, for she could not speak.

The squire began muttering something between his teeth, as he strode up and down the room with his hands in his pockets.

"Take care! you will knock over the jardinière," cried Mrs. Palmer.

Dolly's eyes were all full of tears by this time. As he turned she laid her hand upon the old man's arm. "It is my doing, not his," she said. "You must not be hard upon him; indeed, it is all my doing."

"It is your doing now, and most properly," said the squire, very gravely, and not in the least in his usual half-joking manner. "I can only congratulate you upon having got rid of that abominable prig; but you must not take it all upon yourself, my poor child."

Dolly blushed up. "You think it is not my fault," she said, and the glow spread and deepened. "He was not bound when he left me, only I had promised to wait." Then, with sudden courage, "You will not blame him when I tell you this," she said: "I have not been true to him, not quite true; I told him so: it was a pity, all a pity," she said, with a sigh. She stood with hanging hands and a sweet, wistful, tender face; her voice was like a song in its unconscious rhythms, for deep feeling gives a note to people's voices that is very affecting sometimes.

"You told him so! What will people say?" shrieked poor Mrs. Palmer. "And here is Jonah, whom we have quite forgotten."

Jonah was standing listening with all his honest ears. It seemed to the young soldier that he also had been listening to music, to some sweet sobbing air played with tender touch. It seemed to fill the room even after Dolly had left it; for when she turned and suddenly saw her cousin it was the climax of that day's agitation. She came up and kissed him with a little sob of surprise and emotion, tried to speak in welcome, and then

shook her head and quickly went away, shutting the door behind her. As Dolly left the room the two men looked at one another. They were almost too indignant with Henley to care to say what they thought of his conduct. "Had not we better go?" said Jonah, awkwardly, after a pause.

But Mrs. Palmer could not possibly dispense with an audience on such an occasion as this: she made Jonah promise to return to dinner; she detained the squire altogether to detail to him the inmost feelings of a mother's heart; she sent for cups of tea. "Is Miss Dolly in her room, Julie?" she asked.

"Yes, madame; she has locked the door," said Julie.

"Go and knock, then, immediately, Julie; and come and tell me what she says, poor dear."

Then Mrs. Palmer stirs her own tea, and describes all that she has felt ever since first convinced of Robert's change of feeling. Her experience had long ago taught her to discover those signs of indifference which..... The poor squire listens in some impatience.

While Robert and Rhoda are driving home together from the concert, flattered, dazzled, each pursuing their own selfish schemes, each seeing the fulfillment of small ambitions at hand, Dolly, sitting at the foot of her bed, is saying good-by again and again. The person she had loved and longed to see, and thought of day after day and hour after hour, was not Henley, but some other quite different man, with his face, perhaps, but with another soul and nature..... That Robert who had been so dear to her at one time, so vivid, so close a friend, so wise, so sympathetic, so strong, and so tender, was nothing, no one—he had never existed. The death of this familiar friend, the dispersion of this familiar ghost, seemed, for a few hours, as if it meant her own annihilation. All her future seemed to have ended here. It was true that she had accused herself openly of want of faithfulness; but the mere fact of having accused herself seemed to make that self-reproach lighter and more easy to bear. After some time she roused herself. Marker was at the door, and saying that it was dinner-time, and Dolly let her in, and dressed for dinner in a dreamy sort of way, taking the things, as Marker handed them to her, in silence, one by one. The squire and Jonah were both in the sitting-room when Dolly came in in the white dress she usually wore, with some black ribbons round her waist and tied into her bronze hair. She did not want to look as if she was a victim, and she tried to smile as usual.

"You must not mind me," she said, presently, in return for the squire's look of sympathy. "It is not to-day that this has happened; it began so long ago that I am used to it now." Then she added, "Mamma, I should like to see Robert again this evening, for I left him very abruptly, and I am afraid he may be unhappy about me."

"Oh, as to that, Dolly, from what the squire tells me, I don't think you need be at all alarmed," cried Dolly's mamma: "Jonah met him on the stairs with Rhoda, and really, from what I hear, I think he must have already proposed. I wonder if he will have the face to come in himself to announce it."

Both Jonah and the squire began to talk together, hoping to stop Mrs. Palmer's abrupt disclosures; but who was there who could silence Mrs. Palmer? She alluded a great deal to a certain little bird, and repeatedly asked Dolly during dinner whether she thought this dreadful news could be true, and Robert really engaged to Rhoda?

"I think it is likely to be true before long, mamma," said Dolly, patiently: "I hope so."

She seemed to droop and turn paler and paler in the twilight. She was not able to pretend to good spirits that she did not feel; but her sweetness and simplicity went straight to the heart of her two champions, who would have gladly thrown Robert out of the first-floor window if Dolly had shown the slightest wish for it.

After dinner, as they all sat in the front-room, with wide evening windows, Julie brought in the lamp. She would have shut out the evening and drawn down the blinds if they had not prevented her. The little party sat silently watching the light dancing and thrilling behind the house-tops; nobody spoke. Dolly leaned back wearily. From time to time Mrs. Palmer whispered any fresh surmise into the squire's ear: "Why did not Robert come? Was *she* keeping him back?"

Presently Mrs. Palmer started up: a new idea had occurred to her. She would go in herself, unannounced; she would learn the truth; the squire, he too must come. The squire did as he was bid. As they left the room Jonah got up shyly from his seat, and went and stood out on the balcony. Dolly asked him whether there was a moon.

"There is a moon rising," said the captain, "but you can't see it from where you sit; there, from the sofa, you can see it." And then he came back, and wheeled the sofa round, and began turning down the wheel of the lamp, saying it put the moonlight out.

As the lamp went out suddenly with a splutter, all the dim radiance of the silver evening came in a soft vibration to light the darkened room. One stream of moonlight trickled along the balcony, another came lapping the stone coping of the window: the moon was rising in state and in silence, and Dolly leaned back among her cushions, watching it all with wide-open eyes. Jonah's dark cropped head rose dark against the Milky Way. As the moon rose above the gable of the opposite roof a burst of chill light flooded the balcony, and overflowed, and presently reached the foot of the couch

where Dolly was lying, worn out by her long day.

Robert, who had been taking a rapid walk on the pavement outside, had not noticed the moon: he was preoccupied by more important matters. Rhoda's speeches were ringing in his ears. Yet it was Dolly's fault all along; he was ready to justify himself; to meet complaint with complaint; she might have been a happy woman. He had behaved honorably and forbearingly; and now it was really unfair that she should expect any thing more from him, or complain because he had found his ideal in another and more feminine character.

Dolly had heard the roll of the wheels of the carriage that brought Robert and Rhoda home, but she had not heard the short little dialogue which was being spoken as the wheels rolled under the gateway. The two had not said much on the way. Rhoda waited for Robert to speak. Robert sat gazing at his boots.

"One knows what every body will say," he said at last, very crossly.

"The people who know you as I do will say that Dolly might have been a happy woman," Rhoda answered; "that she has wrecked her own happiness." And then they were both again silent.

Rhoda was frightened, and trembled as she looked into Robert's offended face. She thought that the end of it all might be that he would go—leave her and all other complications, and Rhoda had not a few of her own. If he were to break free? Rhoda's heart beat with apprehension; her feeling for Robert was more genuine than most of her feelings, and this was her one excuse for the part she had played. Her nature was so narrow, her life had been so stinted, that the first touch of sentiment overbalanced and carried her away. Dolly possessed the genius of living and loving and being to a degree that Rhoda could not even conceive; with all her tact and quickness, she could not reach beyond herself. For some days past she had secretly hoped for some such catastrophe as that which had just occurred. She had taken the situation for granted.

"One sometimes knows by instinct what people feel," she said at last. "I have long felt that Dolly did not understand you; but then, indeed, you are not easy to understand." And Robert, raising his eyes from his boots, met the beautiful gloom of her speaking eyes.

One has sometimes watched a cat winding its way between brittle perils of every sort. Rhoda softly and instinctively avoided the vanities of Robert's mind; she was presently telling him of her troubles, money troubles among the rest. She had spent more than her income; she did not dare confess to Mr. Tapeall; she felt utterly incapable of managing that fortune which ought never to have been hers—which she was ready to give up at any hour.

"Cleverer people than I am might do something with all this money," said Rhoda: "something worth doing; but I seem only to get into trouble. You say you will help me, but you will soon be gone."

"I shall be always ready to advise you," said Robert. "If there is any thing at any time—"

"But when you are gone?" said Rhoda, with great emotion.

There was a pause; the horses clattered in under the gateway.

"You must tell me to stay," said Robert, in a low voice, as he helped Rhoda out of the carriage.

As the two slowly mounted the staircase which Dolly had climbed, Jonah, coming away from his aunt's apartment, almost ran up against them. Robert exclaimed, but Jonah passed on. What did Rhoda care that he brushed past as if he had not seen them? She was sure he had seen them, and Rhoda had her own reasons for wishing no time to be lost before her news was made public. She had won her great stake, secured her prize: her triumph was not complete until others were made aware of all that had happened. She urged Robert to tell his aunt at once.

"It is only fair to yourself. Dolly will be telling her story—dear Dolly! she is always so kind; but still, as you have often said, there are two sides to a question. I am afraid your cousin passed us intentionally," said Rhoda. "Not that I care for any thing now."

"Let us have our dinner in peace," said Robert, "and then I will tell them any thing you like." And he sank down comfortably into one of the big arm-chairs, not sorry to put after dinner out of her mind. While he was with Rhoda he was at ease with himself, and thought of nothing else; but he had vague feelings of a conscience standing outside on the landing, and ready to clutch him as he passed out of the charm of her presence.

He did not go straight off to his aunt when he left Rhoda, and so it happened that he missed Mrs. Palmer when she burst in upon Rhoda and Miss Rougemont. The resolute Robert was pacing the pavement outside, and trying to make up his mind to face those who seemed to him more like life-long enemies than friends. He took courage at last, and determined to get it over, and he turned up the street again, and climbed the staircase once more. Philippa had left the hall door open, and Robert walked in as he had been used to do. He opened the drawing-room door. He was angry with Dolly still, angry with her mother, and ready to resent their reproaches. Robert opened the

drawing-room door, and stopped short at the threshold.

The room was not dark, for the bright moonlight was pouring in. Dolly was still lying, asleep. A log burned low in the fireplace, crimsoning the silver light. Robert was startled. He came forward a few steps and stood in the darkened room looking at the sleeping girl: something in her unconsciousness, in the utter silence, in the absence of reproach, smote him as no words of blame or appeal could have done. His excuses, his self-assertions, of what good were they here—who cared for them here? She scarcely moved; she scarcely seemed to breathe; her face looked calm—it was almost like the face of a dead person; and so she was—dead to him. For an instant he was touched, taken by surprise; he longed to awaken her, to ask her to forgive him for leaving her; but as he stood there a dark figure appeared in the open window. It was Jonah, who did not speak, but who pointed to the door.

At any other time Robert might have resented this, but to-night something had moved his cold and selfish heart, some ray from Dolly's generous spirit had unconsciously reached him at last. He turned away and went quietly out of the room, leaving her sleeping still.

He did not see her again; two days later she left for England.

CHAPTER LIV.

HOLY ST. FRANCIS, WHAT A CHANGE IS HERE!

TWELVE o'clock is striking in a bare room full of sunshine. A woman, who is spending her twelfth year in bed, is eating tripe out of a basin; another, sitting by the fire, is dining off gruel; beds and women alternate all down the ward; two nurses are coming and going, one of them with a black eye. Little garlands of paper, cleverly cut out, decorate the place in honor of some royal birthday. Two little flags are stuck up against the wall and flying triumphantly from the farther end of the room. A print of the royal family, brilliantly colored, is also pinned up. Mrs. Fane is walking down the middle of the work-house infirmary with a basket on her arm, when one of the old women puts out a wrinkled hand to call her back.

"Ain't we grand, mum?" says the old woman, looking up. "It does us all good;" and she nods and goes on with her gruel again.

"How is Betty Hodge to-day?" says Mrs. Fane. The old woman points significantly.

All this time some one has been lying quite still at the further end of the room, covered by a sheet.

"At eight o'clock this morning she went off werry comfortable," says the old woman. "Mrs. Baker she is to scrub the steps now; the matron sent word this morning."

That is all. In this infirmary of the work-house it is a matter of course that people should die. It does not mean a black carriage, nodding feathers, nor blinds drawn, and tombstones with inscriptions. It means ease at last, release from the poor old body that used to scrub the steps so wearily day after day. There it was, quite still in the sunshine, with the garlands on the wall.

"*I* sha'n't be long," said the old tripe woman, sententiously. She has been expecting to go for months. A friend has sent her a shroud and some silver paper ready cut: she says it is all ready, and she has seen the priest.

"Ah! Mrs. Blaney, you are a sufferer," says the nurse with the black eye. "She can't eat, mum, but she likes her cup of tea;" and the nurse, who also likes her cup of tea, eyes the little packet which she sees coming out of Mrs. Fane's basket, and fetches a canister, into which she elaborately shakes the refreshing shower.

Mrs. Fane hurries on, for she has a guest at home expecting her, and a tea-party organizing for that afternoon, and she has still a visit to pay in the men's ward. Some one brought her a message—Smith wanted to speak to her; and she walked along the white-washed walls, and past check blue counterpanes, looking for her petitioner. By one of the high windows of the ward lay a brown haggard face, with a rough chin, and the little old slipshod messenger pointed to attract Mrs. Fane's attention. She remembered the man at once. He had come to see her not long before. She had sent him some money to Paris—his own money, that he had given to a nurse to keep. Mrs. Fane looked with her kind round eyes into the worn face that tried to upraise itself to greet her.

"I am sorry to see you here," she said. "Did you not find your friends?"

"Gone to America," gasped the man.

"You know I have still got some of your money," said Mrs. Fane, sitting down by the bedside.

"It were about that I made so bold as to hask for to see you, mum," said the man. "I have a boy at Dartford," he went on, breathing painfully. "He ain't a good boy, but I've wrote to him to go to you, and if you would please keep the money for him, mum—three pound sixteen the reverend calc'lated it—with what you sent for my journey here. I had better have stopped where I was, and where the young lady found me. Lord! what a turn she give me. I know'd it was all up when I seed her come in."

He was muttering on vacantly, as people do who are very weak. Mrs. Fane's kind heart ached for his lonely woe-begone state.

She took his hand in hers—how many sick hands had she clasped in her healing palm! —but poor Smith was beyond her help.

"I see a young fellow that died beside me at the battle of the Alma," said Smith, "and when that young lady came up, as you might be, it brought it all back as it might be now. He was a gentleman, they said; he weren't half a bad chap."

"Who are you speaking of?" said Mrs. Fane, not quite following.

"They called him George—George Vance," said the man; "but that were not his name no more than Smith is mine."

"I have heard of a man of that name who was wounded at the Alma. I did not know that he had died there," said Mrs. Fane. Her hand began to tremble a little, but she spoke very quietly.

Smith hesitated for a minute; then he looked up into the clear, constraining eyes that seemed to him to be expecting his answer. "It ain't no odds to me now," he said, hoarsely, "whether I speak the tru—uth or not; you're a lady, and will keep the money safe for my poor lad. Captain Henley he offered a matter o' twenty pound if we found poor Vance alive. He were a free-handed chap were poor Vance. We know'd he would not grudge the money.....And when the Roosians shot him, poor fellow, it wasn't no odds to him."

Mrs. Fane, looking round, saw the chaplain passing, and she whispered to the old attendant to bring him to her.

"And so you said that you had found him alive, I suppose?" said Mrs. Fane, quickly guessing at the truth, and drawing away her hand.

"Well, mum, you ain't far wrong," said Smith, looking at his thin brown fingers. "There was another poor chap of our corps died on the way to the ships. It were a long way down to the shore; we changed their names. We didn't think we had done no great harm; for twenty pound is twenty pound; but I have heard as how a fortune was lost through it all—a poor chap like me has no fortune to lose."

"It was the young lady you saw who lost her fortune," said Mrs. Fane, controlling herself, and trying to hide her agitation. "You did her great injury, you see, though you did not mean it. But you can repair this wrong. I think you will like to do so," she said, "and—and—we shall all be very much obliged to you." She would not bribe the poor dying man by promising that she would keep his money all the same. "Mr. Morgan," Mrs. Fane continued, turning to the chaplain, who had come up to the bedside, "here is a poor fellow who wishes to do us a service, and to make a statement, and I want you to take it down." She had writing materials in her basket. She often wrote the sick people's letters for them.

"What is it, my man?" said the chaplain; but as he listened his face changed. He wrote and signed the paper; Mrs. Fane signed it; and then, at her request, poor bewildered Smith feebly scrawled his name. He did it because he was told: he did not seem to care much one way or another for any thing more.

"Joe can tell you all about it," he said. "Joe Carter—he has took his discharge. I don't know where he is—Liverpool maybe."

John Morgan could hardly contain his excitement, and his umbrella whirled like a mill as he left the work-house. "You have done a good morning's work," said the chaplain, as he came away with Mrs. Fane; "say nothing more at present. We must find out this Joe who was with him."

Afterward it turned out that it would have been better far if John Morgan had spoken openly at the time; but his terror of Rhoda's schemes was so great that he felt that if she only knew all she would lay hands on Joe, carry off Smith himself, make him unsay all he had said. "There is no knowing what that woman may not do," said Morgan. "She wrote to me; I have not answered the letter. Do you know that the marriage is actually fixed? I am very glad that you have got Dolly away from that adder's nest."

"So am I," said Mrs. Fane, beaming for an instant: she had long ago taken Dolly to her heart with a confused feeling of some maternal fibre strung, of something more tender and more enduring than the mere friendship between a girl and an older woman.

I can not help it if most of those who knew my Dolly persisted in spoiling her. She wanted every bit of kindness and sunshine that came in her way. And yet she was free from the strain that had wrenched her poor little life; she need no longer doubt her own feelings, nor blind herself to that which she would so gladly escape.

The morbid fight was over, and the world was at peace. It was at peace, but unutterably sad, empty, meaningless. When people complain that their lives are dull and have no meaning, it is that they themselves have no meaning. Dolly felt as if she had been in the thick of the fight, and come away wounded. "I may as well be here as any where else," she had said that moonlight evening when poor Jonah had entreated her in vain to come away with him.

Dolly would not go back to Henley; she had her own reasons for keeping away. But next morning, when an opportune letter came from Mrs. Fane, Dolly, who had lain awake all night, went to her mother, who had slept very comfortably, and said, "Mamma, if you can spare me, I think I will go over to England with the squire and Jonah for a little time, until the marriage is over." Mrs. Palmer was delighted.

"To Yorkshire? Yes, dearest, the very best thing you can do."

"Not to Henley, mamma," Dolly said. "I should like, please, to go to Mrs. Fane's, if you do not object."

"What a child you are!" cried Mrs. Palmer; "you prefer poking yourself away in that horrid, dismal hospital, when poor Jonah is on his knees to you to go back to Henley with him."

"Perhaps that is the reason why I must not go, mamma," said Dolly, smiling. "I must not have any explanations with Jonah." Mrs. Palmer was seriously angry, and settled herself down for another nap.

"How can you pretend not to know that you have been going against my wishes all along? Take your own way, however, dearest. Tell Julie not to come until I ring."

So Dolly came to England one summer's afternoon, escorted by her faithful knights. All the streets were warm and welcoming, the windows were open, and the shadows were painting the pretty old towers and steeples of the city: some glint of an Italian sky had come to visit our northern world.

John Morgan met her at the train, Mrs. Fane stood on the door-step to welcome her, the roar of the streets sounded home-like and hopeful once more.

As for Lady Henley, she was furiously jealous when she heard of Dolly in London, and with Mrs. Fane. She abused her to every body for a fortnight. Jonah had come home for two days, and then returned to town again. "That is all we get of him, after all we have gone through," cried poor Lady Henley; "however, perhaps there is a good reason for it; all one wants is to see one's children happy," said the little lady to Mr. Redmayne, who was dining at the Court.

John Morgan lost no time in writing to his confessor, Frank Raban, to tell him of the strange turn that events had taken. "I entreat you to say no word of this to any one," said Morgan. "I am afraid of other influence being brought to bear upon this man that we are in search of, and it is most necessary that we should neglect no precautions. Dolly's interests have been too carelessly served by us all." Raban was rather annoyed by this sentence in Morgan's letter. What good would it have done to raise an opposition that would have only pained a person who was already sorely tried in other ways? Frank somewhat shared Dolly's carelessness about money, as we know. Perhaps in his secret heart it had seemed to him that it was not for him to be striving to gain a fortune for Dolly—a fortune that she did not want. When she looked at him entreatingly and asked him not to interfere, he immediately gave in to her wish, which somehow coincided with his own; now he suddenly began to blame himself, and determined to leave no stone unturned to find the evidence that was wanted. And yet he was more estranged from Dolly at this moment than he had ever been in his life before. He had purposely abstained from any communication with her. He knew she was in London, and he kept away.

Frank Raban was a man of a curious doggedness and tenderness of nature. When he had once set his mind to a thing, he went through with his mind. He could not help himself any more than some people can help being easily moved and dissuaded from their own inclinations. It was this unrelenting determination which had first estranged him from his home, and made him live in some disregard of some received traditions. This one, for instance, that people in the Court Guide are not to marry into the Commercial Directory. Frank had found out his mistake as far as Emma Penfold herself was concerned. Custom would have approved of Raban's second choice, but Frank did not consult other people's opinions any more about Dolly than he had done when he married poor Emma, the gardener's daughter; only he could not help listening in some degree to the accounts that now reached him of the catastrophe at Paris, and feeling that any faint, persistent hope was now crushed forever.

Lady Henley's wishes were apt to color her impression of events as they happened. According to her version, it was for Jonah's sake that Dolly had broken with Robert. It was to Jonah that Dolly had confided her real reason for parting from her cousin. "You know it yourself, squire. It was painful, but far better than the alternative."

"Miss Vanborough's confidences did not extend so far as you imagine, my dear lady," said Mr. Anley: "I must honestly confess that I heard nothing of the sort."

Lady Henley was peremptory. She was not at liberty to show her son's last letter, but she had *full* authority for her information. She was not in the habit of speaking at random. Time would show. Lady Henley looked obstinate. The squire seemed annoyed. Frank Raban said nothing; he walked away gloomily; he came less and less to the Court; he looked very cross at times, although the work he had taken in hand was prospering. Whitewashed cottages were multiplying; a cricket field had been laid out for the use of the village; Medmere was drained and sown with turnip seed. Frank was now supposed to be an experienced agriculturist. He looked in the *Farmer's Friend* regularly. Tanner used to consult him upon a variety of subjects. What was to be done about the sheep? Pitch plaster was no good, should they try Spanish ointment? Those hurdles must be seen to, and what about the flues and the grinders down at the mill?

Notwithstanding these all-absorbing in-

terests, Frank no sooner received Morgan's letter with its surprising news than he started off at once to concert measures with the rector. "Joe" was supposed to be at Liverpool, and Frank started for Liverpool and spent a fruitless week looking up all the discharged and invalided soldiers for ten miles round. He thought he had found some trace of the man he was in search of, but it was tiresome work, even in Dorothea's interest. John Morgan wrote that Jonah was in London, kind and helpful. Foolish Frank, who should have known better by this time, said to himself that they could have settled their business very well without Jonah's help. Frank did him justice, and wished him back in Yorkshire. Lady Henley's hints and wild assertions could not be altogether without foundation, thought this diffident lover. May he be forgiven! Diffidence and jealousy are human failings that bring many a trouble in their train. True love should be far beyond such pitiful preoccupations: and yet, if ever any man loved any woman honestly and faithfully, Frank Raban loved Dorothea, although his fidelity may have shown want of spirit, and his jealousy want of common-sense. Dolly had vaguely hoped that Raban might have written to her, but the jealous thought that she might show Jonah his letter had prevented him from writing. John Marplot wrote that Jonah was often in S—— Street. Why did not the good rector add that it was Mrs. Fane who asked him to come there? Dolly was rather provoked when Jonah reappeared time after time and offered himself to join them in a little expedition that Mrs. Fane had planned. Mrs. Fane was pleased to welcome the rector and the captain too. Six hours' fresh air were to set John Morgan up for his Sunday services. Dolly looked pale; some fresh air would do her good, said her friend.

CHAPTER LV.

SEE YOU NOT SOMETHING BESIDES MASONRY?

On the Friday before they were to start on their little expedition Mrs. Fane was busy; Dolly had been sitting alone for some time.

She suddenly called to old Marker, asked her to put on her bonnet and come out with her. Dolly made Marker stop a cab, and they drove off; the old nurse wanted to turn back when she found out where Dolly was going, but she could not resist the girl's pleading looks. "It will do me good, Marker," said Dolly; "indeed it will. I want to see the dear old place again."

All that morning she felt a longing to see the old place once more: something seemed to tell her that she must go. One often thinks that to be in such a place would bring ease, that the sight of such a person would solve all difficulties, and one travels off, and one seeks out the friend, and it was but a fancy after all. Poor old Church House! Dolly had often thought of going there, but Mrs. Fane had dissuaded her hitherto. All night long Dolly had been dreaming of her home, unwinding the skeins of the past one by one. It may have been a fancy that brought Dolly, but it was a curious chance.

They had come to the top of the lane, and Dolly got out and paid her cab. Her eyes were dim with the past, that was coming as a veil or a shroud between her and the present. She had no faint suspicion of what was at hand. They walked on unsuspiciously to the ivy gate: suddenly Marker cried out, and then Dolly too gave a little gasp. What cruel blow had fallen? what desecrating hand had dared to touch the dear old haunt? What was this? She had not *dreamed* this. The garden wall, so sweet with jasmine, was lying low; the prostrate ivy was struggling over a heap of bricks and rubbish; tracks of wheelbarrows ran from the house to the cruel heap, the lawn was tossed up, a mound of bricks stood raised by the drawing-room windows; the windows were gone, black hollows stood in their places, a great gap ran down from Dolly's old bedroom up above to the oak room on the terrace; part of the dining-room was gone: pathetic, black, charred, dismantled, the old house stood stricken and falling from its foundation. Dolly's heart beat furiously as she caught Marker's arm.

"What has happened?" she said. "It is not fire—it is—oh, Marker, this is too much!"

Poor Marker could not say one word; the two women stood clinging to each other in the middle of the garden walk. The sky was golden, the shadows were purple among the fallen bricks.

"This is too much," Dolly repeated, a little wildly; and then she broke away from Marker, crying out, "Don't come! don't come!"

The workmen were gone: for some reason the place was deserted, and there was no one to hear Dolly's sobs as she impatiently fled across the lawn. Was it foolish that these poor old bricks should be so dear to her? foolish that their fall should seem to her something more than a symbol of all that had fallen and passed away? Ah, no, no! While the old house stood she had not felt quite parted, but now the very place of her life would be no more; all the grief of that year seemed brought back to her, when she stopped short suddenly and stood looking round and about in a scared sort of way. She was looking for something that was not any more—listening for silent voices. Dolly! cried the voices, and the girl's whole heart answered as she stood stretching out her arms toward

the ulterior shores. At that minute she would have been very glad to lie down on the old stone terrace and never rise again. Time was so long, it weighed and weighed, and seemed to be crushing her. She had tried to be brave, but her cup was full, and she felt as if she could bear no more, not one heavy hour more. This great weight on her heart seemed to have been gathering from a long way off, to have been lasting for years and years: no tears came to ease this pain. Marker had sat down on the stone ledge, and was wiping her grief in her handkerchief. Dolly was at her old haunt by the pond, and bending over and looking into the depth with strange circling eyes.

This heavy weight seemed to be weighing her down and drawing her to the very brink of the old pond. She longed to be at rest, to go one step beyond the present, to be lying straight in the murky gray water, resting and at peace. Who wanted her any more? No one now. Those who had loved her best were dead; Robert had left her: every one had left her. The people outside in the lane may have seen her through the gap in the wall, a dark figure stooping among the purple shadows: she heard their voices calling, but she did not heed them; they were only living voices: then she heard a step upon the gravel close at hand, and she started back, for, looking up, she saw it was Frank Raban who came forward. Dolly was not surprised to see him. Every thing to-day was so strange, so unnatural, that this sudden meeting seemed but a part of all the rest. She threw up her hands and sank down upon the old bench.

His steady eyes were fixed upon her. "What are you doing here?" he said, frightened by the look in her face, and forgetting in his agitation to greet her formally.

"What does it all matter?" said Dolly, answering his reproachful glance, and speaking in a shrill voice: "I don't care about any thing any more; I am tired out, yes, very tired," the girl repeated. She was wrought up and speaking to herself as much as to him, crying out, not to be heard, but because this heavy weight was upon her, and she was struggling to be rid of it and reckless —she must speak to him, to any body, to the shivering bushes, to the summer dust and silence, as she had spoken to the stagnant water of the pond. She was in a state which is not a common one, in which pain plays the part of great joy, and excitement unloosens the tongue, forces men and women into momentary sincerity, and directness carries all before it; her long self-control had broken down, she was at the end of her powers—she was only thinking of her own grief and not of him just then. As she turned her pale stone-cut face away and looked across the low laurel bushes, Frank Raban felt a pang of pity for her of which Dorothea had no conception. He came up to the bench.

"Don't lose courage," he said—"not yet, you have been so good all this time."

It was not so much what he said which touched her, as the way in which he said it. He seemed to know how terribly she had been suffering, to be in tune even with this remorseless fugue of pain repeated. His kindness suddenly overcame her and touched her; she hid her face in her hands and burst out crying, and the tears eased and softened her strained nerves.

"It was coming here that brought it all back," she said; "and finding—" She looked round.

"I am very much shocked, more so than I can tell you," said Frank. "It was to-day quite by chance that I heard what had happened. I came off at once. I have been to your house. It seems Miss Parnell must have wanted money, and that she suddenly closed with a builder's offer. Mr. Tapeall should have warned us. I can hardly tell you the rest, or you will never forgive our fatal delay. They had no right whatever to do what they have done. You are the only person interested; it is you only to whom they should have applied, and we have been most blamable in not telling you this before."

Frank then and there began to tell Dolly of the curious discovery which Mrs. Fane had made, of Smith's confession, and of all that it involved. He told her very carefully, sparing her in every way, thinking of the words which would be simplest and least likely to give pain.

"We ought to have told you before," he repeated. "I shall never forgive myself. We meant to spare you until all the facts were clearly ascertained. We have made a fatal mistake, and now I am only adding to your pain."

But the tears with which Dolly listened to him were not bitter, his voice was so kind, his words so manly and simple. He did not shirk the truth, as some people sometimes do when they speak of sorrow, but he faced the worst with the simplicity and directness of a man who had seen it all very near. "Please don't blame yourself," she said.

If there are certain states of mind in which facts seem exaggerated and every feeling is overwrought, it is at these very times that people are most ready to accept the blessings of consolation. "Peace, be still," said the Divine Voice, speaking to the tossing waves. And voices come, speaking in human tones to many a poor tempest-tossed soul. It may be only a friend who speaks, only a lover perhaps, or a brother's or sister's voice. Love, friendship, brotherhood, give a meaning to the words. Only that day Dolly had thought that all was over, and already

the miracle was working, the storm was passing from her heart, and peace was near at hand.

It all seemed as a dream in the night, when she thought it over afterward. Some few days had passed. She had not seen Frank again, but to have seen him once more made all the difference to her.

Dolly was standing out on the balcony, carefully holding her black silk dress away from the dusty iron bars. It was a bright, gentle-winded Sunday morning, and the countless bells of the district were jangling together, and in different notes calling their votaries to different shrines. The high bell striking quick and clear, the low bell with melancholy cadence, the old-fashioned parish bell swinging on in a sing-song way: a little Catholic chapel had begun its chime an hour before. From the house doors came Sunday folks—children trotting along, with their best hats and conscious little legs, mammas radiant, maid-servants running, cabs going off laden. All this cheerful jingle-jangling filled Dolly's heart with a happy sadness. It was so long since she had heard it, and it was all so dear and so familiar, as she stood listening to it all, that it was a little service in her heart of grateful love and thanks—for love and for praise; for life to utter her love for the peace which had come to her after her many troubles. She was not more happy outwardly in circumstance, but how much more happy in herself none but she herself could tell. How it had come about she could scarcely have explained; but so it was. She had ceased to struggle; the wild storm in her heart had hushed away; she was now content with the fate which had seemed to her so terrible in the days of her girlhood. Unloved, misunderstood, was this her fate? she had in some fashion risen above it, and she felt that the same peace and strength were hers. Peace, she knew not why; strength, coming she scarcely knew how or whence. It was no small thing to be one voice in the great chorus of voices, to be one aspiration in the great breath of life, and to know that her own wishes and her own happiness were not the sum of all her wants.

CHAPTER LVI.

THE PLAY IS PLAYED, THE CURTAIN DROPS.

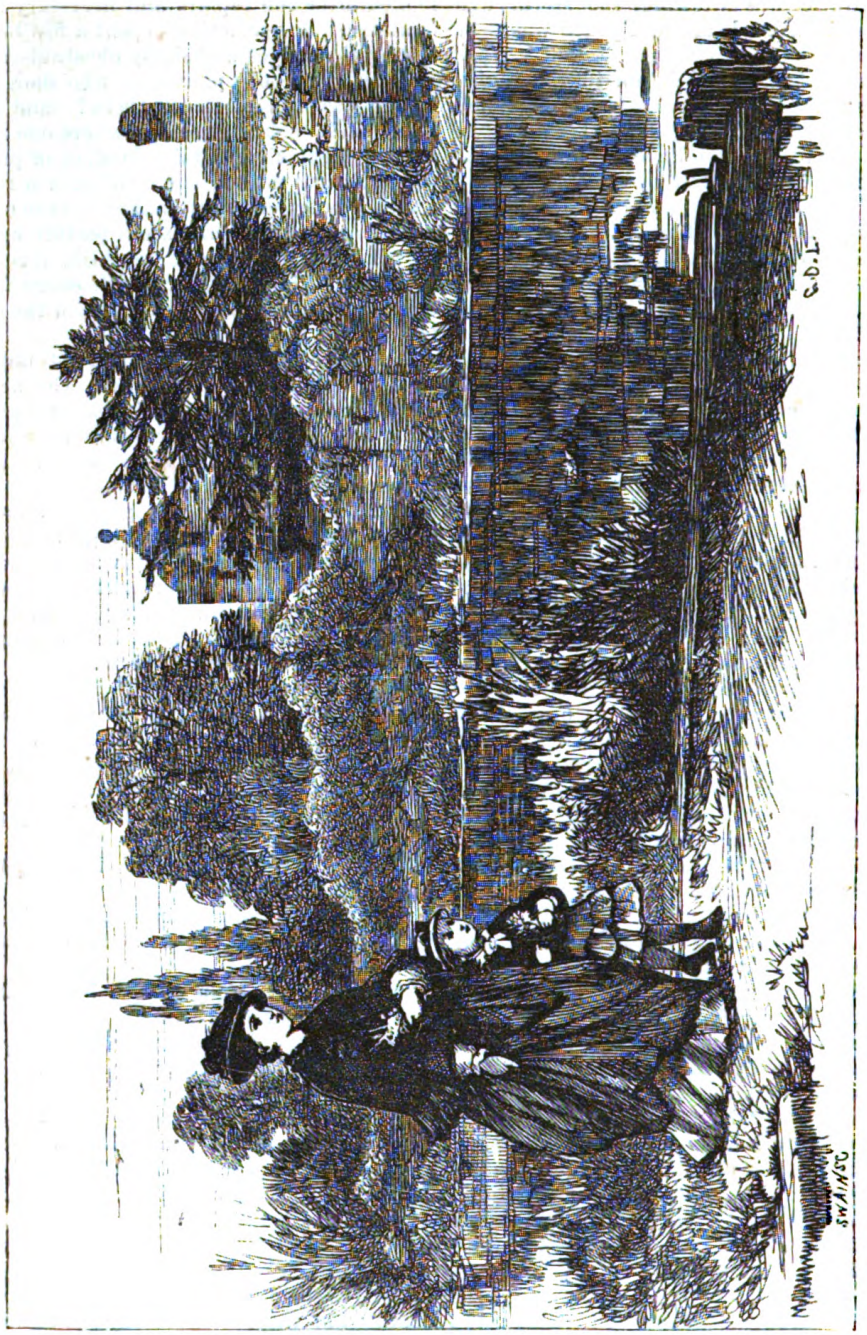
COLONEL FANE was not a rich man, but he had a house which had been his father's before him, and to which he returned now and again in the intervals of service. It stood at a bend of the river, and among hollows and ivy. He looked forward to ending his work there some day, and resting for a year or two. In the mean while the old house was often let in summer, and Mrs. Fane looked after the repairs and necessary renovations. She sometimes spent a few hours among the sedges and shady chestnut-trees. She loved the old place—as who does not love it who has ever been there?—and discovered this sleeping bower, where one may dream of chivalry, of fairy-land, or of peace on earth, or that one is sunshine, or a river washing between heavy banks; or turn one's back to the stream and see a pasture country sliding away toward the hills, through shade and fragrant hours, with songs from the hedges and mellow echoes from the distant farms.

The little party came down, not unprepared to be happy. Mrs. Fane, who never wasted an opportunity, had also brought a little girl from her orphanage, who was to remain for a time with the housekeeper at Queensmede—that was the name of the old house. The child was a bright little creature, with merry soft eyes flashing in wild excitement, and the kind lady was somewhat divided between her interest in some news that John Morgan was giving her and her anxiety lest little Charlotte, her goddaughter, should jump out of window.

"We have to thank the captain here," said John Morgan, "for finding the man we were in search of. I have sent to Tapeall," said John, rubbing his hands. "I find that, after all my precautions, Rhoda got a hint from him last week. Tapeall was evidently prepared for something of the sort when I called there yesterday. However, it is all right—thanks to the captain."

"I don't deserve any thanks," said Jonah. "Poor Carter found me out. He wanted to borrow 10*s*."

"When did all this happen?" said Mrs. Fane; and she kissed Dolly.



"Only yesterday," answered the rector. "I telegraphed to Raban; poor fellow, he had gone off to Shoeburyness on some false scent; I left word at home in case he should call."

Dolly stooped down and held up little Charlotte to see the pretty golden fields fly past, and the sheep and the lambs frisking.

"Are they gold flowers?" said the little girl. "Is that where ladies gets their money? Is you going to be very rich?"

Dolly did not answer; she had scarcely heard what they all were saying, so many voices were speaking to her, as she watched the flying fields and frisking lambs. Was it all to be hers? The old house was gone—and this was what she most dwelt upon—money was but little in comparison to the desolate home. Could she ever forgive Rhoda this cruel blow? Ah! she might have had it all, if she had but spared the dear home. A letter had come from Robert only that morning, and all this time Dolly was carrying it unopened in her pocket, failing courage to break the seal and open up the past.

DOLLY AND CHARLOTTE BY THE RIVER.

Shadows and foreboding clouds were far away from that tranquil valley, from the shady chestnut-tree beneath which Dolly is sitting, resting and shading her eyes from the light.

When the banquet is over they get up from their feast and stroll down to the river-side, through the silent village into the over-grown meadow, where green waving things are throwing their shadows, where an old half-ruined nunnery stands fronting the sun, and the silver river beyond the fields.

There were nuns at Queensmede once: one might fancy a Guinevere ending her sad life there in tranquil penitence; a knight on his knees by the river; a horse browsing in the meadow. The old building still stands among wild flowers and hay, within sight of the river bend; the deserted garden is unfenced, and the roses are growing straggling in the field, and mingle their petals with the clover and poppies that spring luxuriantly. The stable is a gabled building with slender lancet windows, with open doors swinging

on the latch. The nuns have passed out one by one from the Lady House, so they call it still. Dolly peeped in at the dismantled walls, and pictured their former occupants to herself—women singing and praying with pale sweet faces radiant in the sweet tranquillity of the old place, and yet their life seemed thin and sad somehow. It was not what she herself had ever dreamed of; a less beautiful existence would better content her, thought Dolly. It was here that she found courage at last to read Robert's letter as she stood in the doorway. She pulled it out and broke the seal.

"My dear Dorothea,—Notwithstanding all that has happened, I still feel that it is no common tie of friendship and interest which must always bind us together, and that it is due to you that I myself should inform you of a determination which will, as I trust, eventually contribute to every body's happiness. After what you said to me it will, I know, be no surprise to you to have heard that I have proposed to Rhoda, and been accepted by her, but I am anxious to spare your learning from any body but myself the fact that we have determined to put on our marriage, and that this letter will reach you on our wedding-day.

"Your friend Rhoda has entirely thrown herself upon my guidance, and under the circumstances it has seemed advisable to me to urge no longer delay. My affairs require my presence in England; hers also need the most careful management. I am not satisfied with the manner in which certain investments have been disposed of. Notwithstanding some—perhaps not unnatural—reluctance on her part, I propose returning to Church House immediately after our wedding, where, let me tell you, my dear Dora, you will ever find a hearty welcome, and a home if need be, although I am anxious to forget the past, particularly under my present circumstances. I can not but recall once more to you how differently events might have turned out. I have never had an opportunity of explaining that to you, but I hope you do me the justice to believe that it was not your change of fortune which affected my decision to abide by your determination. I have been most anxious to assure you of this. It was your want of trust which first made me feel how dissimilar we were in many ways, how little chance there was in my being able to influence you as a husband. Forgive me for saying that you did not understand my motives, nor do entire justice to the feelings which made me endeavor to persuade you for your own advantage as well as mine. If you had come to India when I wished it, much anxiety to yourself and much sorrow would have been spared you. Now it is too late to think of what might or might not have been: only this fact remains, and do not forget it, dear Dora, that you will never have a more sincere friend, nor one more ready to advise and assist you in any difficulty, than

"Your affectionate cousin, R. Henley.

"Rhoda (did she know I was writing) would unite in most affectionate love. I find her society more and more congenial and delightful to me."

"What are you reading, Dolly?" said Jonah, coming up. "I ought to know that confounded blue paper. Has that fellow the impudence to write to you?" Then he asked, more shyly, "May I see the letter?"

"No, dear Jonah," Dolly said, folding it up. "It is a kind letter, written kindly."

Then she looked hard at him and blushed a little. "This is his wedding-day," she said; "that is why he wrote to me."

Dolly would not show her letter to any one, except to Mrs. Fane. She felt that it would be commented on; she was grateful to Robert for writing it; and yet the letter made her ashamed, now that she began to see him not as he was, but to judge from another standard, and to look at him with other people's eyes. In after-days she scarcely ever spoke of him even to her nearest and dearest. To-day she merely repeated the news. No one made any comment in her hearing. They were anxious at first, but Dolly's face was serene, and they could see that she was not unhappy.

One thing neither Dolly nor Mrs. Fane could understand. Robert evidently knew nothing of the destruction of Church House.

"I am glad Robert had nothing to do with it," said Dolly.

"Will you come wiss me?" said little Charlotte, running up and taking Dolly's hand. Miss Vanborough was not sorry to leave the discussion of Robert's prospects to others, and she walked away, with the little girl still holding by her hand, and went and stood for a minute on the bridge, looking down at the river and the barge floating by; it slid under her feet with its cargo of felled wood, and its wild and silent human cargo, and then it went floating away between the summer banks.

The waters deepened and wavered. Tall waving grasses were also floating and dragging upon the banks, crimson poppies starting here and there, golden irises hanging their heads by the river. Little Charlotte presently ran away, and, half sunk in the grasses, stood struggling with a daisy. A sunshiny man came leading a horse from the sleepy old barn that stood beyond the Lady House. Its old bricks were hung with green veils, and with purple and golden nets of lichen and of moss.

Dolly stopped—was it a burst of music? It was a sweet overpowering rush of honeysuckle scent coming from the deserted garden. In this pastoral landscape there was no sound louder than the lap of the water, or the flowing gurgle of the pigeons straggling from one to another moss-grown ledge. Chance lights stole from the sedge to the grassy banks, from the creek by sweet tumbled grasses to the deserted old grange. Round about stood the rose-trees, flowering in the wilderness, dropping their blossoms; the swallows were flying about the eaves; the daisies sparkled where they caught the sunlight. The indescribable peace and silence of it all tranquillized Dorothea's troubled heart, although even then some thoughts came to her of the life she had wasted, and the love she had thrown away. It was not as in that day when in her despair she had thought there was nothing left; the bitterness of her wound was healed: it was not for the news that had come that she was grieving.

While Dolly and little Charlotte were

gathering their flowers, Frank Raban, who came walking along the fields by the river, had joined the others by the Lady House. Morgan's telegram had summoned him back to London, and his message had brought him on to Queensmede. He had heard the news; he said very little about it.

"Where is Miss Vanborough?" he asked, presently.

"Don't you see her on the bridge?" said Jonah, pointing.

Frank walked on a few steps. He saw her standing on the bridge, high above the torrent; then he saw her come slowly along, followed by her little companion.

They were walking slowly away from the field and the deserted garden. As they all straggled slowly homeward, with shadows at their feet, the old ivy buttresses of the walls were beginning to shine with vesper light, with deeper and crisper lines in the pure illumination all around. Dolly thought of Haydn's andante again, only here it was light that brought music out of all these instruments—silences, perfumes, and heavy creepers from the bewildering, sweet old place, overflown with birds, heaped up and falling into hollows.

Frank walked silently beside Dolly. He had come prepared to sympathize: full of concern for her, and she did not seem to want his help, or to care for it any more. That day by the pond, when she had first turned to him in her grief, he had felt nearer to her than now, when in her reserve she said no word of all that he knew she must be feeling. Could this be pride? Did she show this indifferent face to the world? was she determined that no one should guess at the secret strain? Was she treating him as the first-come acquaintance? It was very proper, no doubt, and very dignified, but he was disappointed. He could not understand it. She must be unhappy, and yet as he looked at her face he saw no effort there—only peace shining from it. She had stopped before a garland of briony that was drooping with beautiful leaves, making a garland of shadows upon the bricks. She pointed it out to him.

"It is very pretty," said Raban, "but I am in no appreciative mood;" and he looked back at Jonah, who came up just then, and began admiring. Why was Jonah always with her? Why did he seem to join into all their talk? Frank was jealous of Jonah, but he was still more jealous of Dorothea's confidence. There seemed to be no end to Dolly's cousins. Here was Jonah, to whom she had already given more of her confidence than to him—Jonah, who had served her effectually, while he, Frank, had done nothing. He had not quite believed Lady Henley's intimations, but now he began to believe them, and he looked up at Dolly, who was walking along, still looking at the bunches of briony she had gathered. It was not a very heroic mood, and I am truly ashamed of my hero's passing ill humor, coming as it did at this inopportune moment to trouble Miss Vanborough's tardy happiness. And yet somehow it did not trouble her; she saw that Frank was silent and gloomy, but with her instinct for idealizing those she loved, she supposed there was some good reason for it, and she felt that she might perhaps even try to find out what was amiss; it was no longer wrong to take an interest in all that affected him—even Dolly's conscience allowed this—and, when the others walked on, in her sweet voice she asked "if any thing was wrong," and as she spoke her gray eyes opened kindly. Dolly loved to take care of the people she loved. There was a motherly instinct in all her affection.

"My only concern is for you, and for the news that Jonah Henley has told me," said Frank; "but you did not tell me yourself, so I did not like to speak of it to you."

Dolly sighed—then looked up again. "I do not know how to talk of it all," she said, "and that is why I said nothing."

"You are right!" Frank answered, with a sort of sneer; "when one comes to think of it, there are no words in common language that can characterize such conduct."

"Please don't," said Dolly, pained; then she added, "I have been so unhappy that I must not ever pretend to feel what I am not feeling. Perhaps you may think it strange I am happy, not unhappy, to-day. You are all so kind—every thing is so kind. Look at that Virginia creeper over the gate—and that ocean of ivy. I feel as if I could believe in happiness again. I am only beginning now to believe in it. I am sure I hope they will have a great deal in their lives. Robert has written to me very kindly. Is not Jonah calling us?" Jonah was waiting for them at the gate of the house, and waving a long, shadowy arm, that seemed to reach across the road.

"Happiness," said Frank, lingering, and cross again, and looking round. "This is the sort of thing people mean, I suppose; green pastures and still waters, and if one can be satisfied with grass, as the people were in the Psalms, so much the better for one's self; one may enjoy all the things one didn't particularly want—and watch another man win the prize; another perhaps who doesn't even—" Frank stopped short—what was he saying? he might be giving pain, and he hated himself and his ill humor, jarring and jangling in the peaceful serenity.

But Dolly finished the sentence calmly enough. "Who doesn't care for it; perhaps the prize isn't worth having," she said, very slowly. She did not think of herself until she had spoken; then suddenly her heart began to beat, and she blushed crimson; for

her eyes met his, and his looks spoke plainly enough—so plainly that Dolly's gray orbs fell beneath that fixed dreamy gaze. It seemed to look through her heart. Could he read all that she was thinking? Ah! he might read her heart, for she was only thinking as she stood there of all her friend's long fidelity and steady friendship. What had she ever done to deserve it all? And her heart seemed to answer her thought with a strange silent response. Now she might own to herself the blessing of his unfailing friendship; it was no longer a wrong to any human being. Even if she were never any thing more to him, she might openly and gratefully accept his help and his interest; acknowledge the blessing, the new life it had brought her. She had struggled so long to keep the feeling hidden away, it was an unspeakable relief to have nothing more to conceal from herself nor from others—nothing more. She knew at last that she loved him, and she was not ashamed. What a journey she had traveled since they had stood by the spring that autumn day, not a year ago! what terrible countries she had visited! and had it come to this once more? Might she love now in happiness as well as in sorrow? Was she not happy, standing in this golden hollow, with the person whose society she loved best in all the world? No other human being was in sight, nothing but the old shady village, floating into overflowing green, the sleepy hay-cocks, the empty barn, the heaping ivy on the wall, the sunlight slanting upon the silence. She did not mean to speak, but Frank, in this utter silence, heard her secret thought at last. "Don't you know?" said Dorothea. "Oh, Frank, don't you know?" Did she speak the words or look them? He could never tell: only this he knew, that she was his, that life is kind, that true hearts do come together, that one moment of such happiness and completeness lights up a whole night's wild chaos, and reveals the sweetness of the dawning world.

Jonah, who had gone on with Mrs. Fane, came to the door to call them again, but they did not see him, and he went back into the house, where Mrs. Fane and John Morgan were hard at work upon an inventory.

"Here, let me help you," said Jonah; "I'm not too clumsy to count tea-cups." Little Charlotte made herself very useful by carrying a plate from one chair to another. She finally let it drop, and would have cried when it broke, if the good-natured young captain had not immediately given her the ink to hold. This mark of confidence filled her with pride, and dried her tears. "Sall I 'old it up very high?" she said. "Can you draw a ziant? I can, wiss your pen."

It took them nearly an hour to get through their task, and by this time the tea was ready in the library, the old-fashioned urn hissing and steaming, and Jonah and John Morgan were preparing to set out on their journey home. Frank went with them, and then when he was gone Dolly told her friend her story, and the two sat talking until late into the starlight.

Two days afterward an announcement appeared in the *Times*, and the world learned that Robert Henley and Miss Rhoda Parnell had been married at the British Embassy at Paris by special license by the Bishop of Orinoco. The next news was that of Dolly's marriage to Frank Raban. Pebblesthwaite was very much excited. Lady Henley's indignation was boundless at first, but was happily diverted by the news of her favorite daughter Norah's engagement to Mr. Jack Redmayne.

James Brand's blue eyes twinkled a kindly sympathy when the letter came announcing Frank's happiness. He came up to be present at the wedding. It was in the little city church, with its smoke-stained windows. John Morgan's voice failed as he read the opening words and looked down at the bent heads of the two who had met at last hand in hand. "In perfect love and peace," he said; and, as he said it, he felt that the words were no vain prayers.

He had no fear for them, nor had they fear for each other. Some one standing in the drizzle of the street outside saw them drive off with calm and happy faces. It was Robert Henley, who was passing through London with his wife. Philippa, who saw him, kissed her hand and would have stopped him, but he walked on without looking back. He had been to Mr. Tapeall's that morning, after a painful explanation with Rhoda—Rhoda, who was moodily sitting at the window of her room in the noisy hotel, and going over the wretched details of that morning's talk. It was true that she had sold Church House, tempted by the builder's liberal offer, and wanting money to clear the many extravagances of her Paris life; it was true that she had concealed the lawyer's letter from Robert in which she learned that her title to the property was about to be disputed. She had hurried on their wedding, she had won the prize for which her foolish soul had longed: it was not love so much as the pride of life and of gratified vanity. These things had dazzled her, for these things this foolish little creature had sacrificed her all. Dolly might have been happy in time even married to Robert, but for Rhoda what chance was there? Would her French kid gloves put out their primrose fingers to help her in her lonely hours? would her smart bonnets crown her home with peace and the content of a loving spirit? She lived long enough to find out something of the truth, and to come to Dolly one day to help her in her sorest need. This was long after, when Dolly had long

been living at Ravensrick, when her children were playing round about her, and the sunshine of her later life had warmed and brightened the sadness of her youth. What more shall I say of my heroine? That sweet and generous soul, ripening by degrees, slow and credulous, not imbittered by the petty pains of life, faithful and tender and vibrating to many tones, is no uncommon type. Her name is one that I gave her long ago, but her real names are many, and are those of the friends whom we love.

Church House was never rebuilt. At Dolly's wish a row of model lodgings, with iron balconies, patent boilers, ventilators, and clothes hanging out to dry on every floor, have been erected on the site of the place where Lady Sarah lived; and so the kind woman's dreams and helpful schemes have come true.

"We could not put back the old house," said Dolly, "and we thought this would be the next best thing to do." The rooms are let at a somewhat cheaper rate than the crowded lodging-houses round about. People, as a rule, dislike the periodical whitewashing, and are fond of stuffing up the ventilators, but otherwise they are very well satisfied.

Dolly did not receive many wedding presents. Some time after her marriage Rhoda sent Dolly a diamond cross; it was that one that Frank Raban had given her many years before. She was abroad at the time, and for many years neither Rhoda nor Dolly met again. Mrs. Palmer used to write home accounts of Rhoda's beauty and fashion from Ems and other watering-places where she used to spend her summers.

The Admiral, who was still abroad, made it a special point, so Philippa declared, that she should spend her summers on the Continent.

One day Mrs. Raban was turning out some papers in a drawer in her husband's writing-table, when she came upon a packet of letters that she thought must belong to herself. They were written in a familiar writing that she knew at once, for it was Henley's. They were not addressed, and Dolly could not at first imagine how these letters had come there, nor when she had received them. As she looked she was still more bewildered. They were letters not unlike some that she had received, and yet they had entirely passed from her mind. Presently turning over a page, she read not her own name on the address, but that of Emma Penfold, and a sentence: "It is best for your welfare that we should not meet again," wrote Henley. "I am not a marrying man myself—circumstances render it impossible. May you be as happy in your new life. You will have an excellent husband, and one who....."

"What have you got there?" said Frank, who had come in.

"Oh, Frank, don't ask me," said Dolly, hastily going up to the fire that was burning in the grate, and flinging the packet into the flames; then she ran up to him, and clung hold of his arm for a minute. She could not speak.

Frank looked at the burning packet, at the open drawers, and then he understood it all. "I thought I had burned those letters long ago," he said; and stooping, he took his wife's hand in his and kissed it.

* * * * * *

As I write the snow lies thick upon the ground outside, upon the branches of the trees, upon the lawns. Here, within, the fire leaps brightly in its iron cage; the children cluster round the chair by the chimney-corner, where the mother sits reading their beloved fairy tales. The hearth was empty once—the home was desolate; but time after time, day by day, we see the phenix of home and of love springing from the dead ashes; hopes are fulfilled that seemed too sweet to dream of; love kindles and warms chilled hearts to life. Take courage, say the happy, to those in sorrow and trouble; are there not many mansions even here? seasons in their course, harvests in their season, thanks be to the merciful ordinance that metes out sorrow and peace, and longing and fulfillment, and rest after the storm.

Take courage, say the happy—the message of the sorrowful is harder to understand. The echoes come from afar, and reach beyond our ken. As the cry passes beyond us into the awful unknown, we feel that this is, perhaps, the voice in life that reaches beyond life itself. Their fires are out, their hearths are in ashes, but see, it was the sunlight that put out the flame.

THE END.

RECOLLECTIONS OF AN OLD STAGER.

Notices of conspicuous Public Men, with characteristic Anecdotes illustrating their Peculiarities.—Accounts of Congressional and other Duels, and personal Collisions in Congress, including a Glance at Washington Public Life during several Administrations.

MORE ABOUT GAMBLING.

MANY amusing stories were current at different times illustrative of the peculiar habits and customs of the people who procured a livelihood by playing upon the weaknesses and passions of the communities in which they resided, or, in other words, lived by their wits. In the old time this class of men came nearer social recognition than at the present day. I do not refer to the enforced association of the race-course, growing out of a community of pursuits and tastes not dissimilar. Blacklegs and gentlemen stand on the same plane, and meet on apparently equal terms, with betting books in their hands. Neither in this respect nor

in the character of the transactions on the turf has there been any sensible change within the last third of a century. Gambling in every form is always demoralizing, and those who habitually indulge in the practice get their notions of right and wrong much mixed up. On the race-course the outsiders used to be taken in and plundered by the knowing ones. Experienced turfmen were accustomed to laugh at the idea of a fair race. The result was known to a few favored ones in advance. This was the case in important races with hardly an exception. I heard the "Napoleon of the turf," as Colonel Johnson, of Virginia, was termed, say, in a moment of exuberant conviviality, that Bob Stockton was worth a clean ten thousand dollars a year to him. "I never let him win a race," he continued, "but he generally runs a good second, and hopes for better luck next time. He's full of pluck, and is sure of winning on the next trial." James Long, who was a joint owner with Colonel Johnson of the famous racer Boston, in a fit of extravagant frankness, the result of a drinking bout of unusual length, told an acquaintance in advance of the race that Fashion was to beat the old sorrel, that the thing was all arranged, and advised him to make up his betting book accordingly. This might have been the mere vagary of a drunken man, or he might unwittingly have revealed a secret intended to be confined to a limited number of sharpers. Long was the principal proprietor of the well-known gambling-house on the corner of Sixth Street and the Avenue, where Thaddeus Stevens and Franklin Pierce sometimes risked their money. The great turfmen act upon this plan at the present day, and a similar device is adopted by experts in every species of gambling. The brokers of Wall and Broad streets would grow rich but slowly if their operations were confined to fleecing each other. The country speculators are their natural prey, and the losses of the scores who fall victims to their artful representations, if small individually, constitute a large sum in the aggregate.

The Washington gambling-houses have never been supported to any considerable extent by the resident population. Members of Congress, particularly from the South, Southwest, and West, were the largest contributors to the incomes of the sporting men. Contractors and Indian traders were generally bold and sometimes desperate players. Members of the House frequently staked their mileage and per diem at the faro-table, and they played all sorts of round games, "short cards," as they were called, in the club rooms. Probably the amount risked would not constitute what is termed "high play" in these days, but the losses of these men of limited means were often sufficient to keep them impoverished and embarrassed during their entire Congressional service. Some men played for excitement chiefly, not caring much whether they won or lost. Thaddeus Stevens was one of this description. He was like Fox, who described winning at hazard as the greatest pleasure in life, and losing at the same game as the next greatest. Stevens lost and won with the same apparent indifference. He played with consummate coolness, never lost his temper, and never increased the amount of his bet either to retrieve his losses or more rapidly to increase his winnings. His sarcastic remarks upon the discomposure of his fellow-players, who sometimes exclaimed with rage and profanity at their ill luck, were always witty as well as cutting. While they were eating and drinking with the voracity of cormorants, he never indulged in any thing more stimulating than a cracker and a sip of water. The contrast between his coolness and apparent apathy and the eager, fierce excitement of others sitting at the same table and engaged in the same pursuit was amazing. I have rarely seen a more pitiable and painful exhibition than was often presented by the ungoverned passions of a gamester after a run of ill luck. To Mr. Stevens such displays of weakness seemed to afford amusement rather than to excite sympathy or compassion. He was a hard, cynical man, capable of acts of benevolence under strong emotion, but gentleness or tenderness was not his ordinary mood. He threw off more good things in conversation without effort than any man I ever saw, and his sayings were pointed with a degree of epigrammatic force that I never witnessed in any other man.

I am surprised that a biography of Mr. Stevens should not ere this have been prepared by a competent hand. Hundreds of greatly inferior men have had their lives written up and published, notwithstanding their obscurity and the uneventful nature of their careers. Mr. Stevens was a most dextrous and effective controversial debater. He was never seen at his best in Congress. In the Constitutional Convention of Pennsylvania in 1836, and subsequently in the Legislature, he distinguished himself beyond all his contemporaries in that capacity. Self-possessed, conscious of his strength, and rather aggressive in his disposition, he defied all comers, and was in a perpetual contest, never finding his match in a personal discussion.

There was a story current at Washington in the closing year of Mr. Tyler's administration which created some merriment among those acquainted with the parties to the affair. A well-known gambler, who had a faro-bank on Pennsylvania Avenue, opened a place of business at the White Sulphur Springs, in Virginia. The wife of the gambler was a well-connected woman of Wash-

ington, of good character, of fine culture, and considerable social experience. The society at the White Sulphur was inclined to exclusiveness, and while the gentlemen associated freely with the gambler, lost their money at his table, partook of his hospitality without scruple or hesitation, and recognized him on all occasions, his wife was cut dead by the ladies in public and private. She had an elegant establishment, drove a beautiful pair of ponies in a stylish phaeton, dressed more richly and in better taste than any other lady at the Springs, wore more costly jewels, and really bore herself in a proper and becoming manner. But all this had no effect upon the aristocratic ladies who composed a large portion of the visitors at the Springs, except that, being annoyed by her superior display, they manifested their vexation by loftier airs and a more rigorous enforcement of the exclusion to which they had subjected her at the outset. She lived in a condition of isolation and solitude as utter as if she had been on a desert island, and this at a fashionable and well-attended watering-place. As the season approached the close, and the visitors were about to disperse, the lady determined to free her mind, and at the same time acquaint her censors with her view of the situation. One fine morning, when most of the ladies were assembled in the parlor, she appeared among them, much to their astonishment. With perfect composure, and the air of a well-bred woman, she addressed them substantially as follows: "Ladies, we have been here in the same house most of us for more than two months, and not a word has been addressed to me by one of you during that time. I am as well born, as well educated, as well behaved, and of as good character as any lady among you. Not a syllable has ever been heard derogatory to my reputation, and yet you have treated me with less consideration than if I had been one of your negro slaves. You have passed me with a supercilious toss of the head, as though there was contamination in my touch. The cause of this arrogance and insolence is obvious enough. You refuse to recognize me because my husband is a gambler. That such is his profession I avow without hesitation. But what of that? Your husbands are all gamblers. They risk their money at his table. They are on one side of that table, and he on the other. You can not make a distinction between them on that ground. But that my husband's is the best side of the table is proved by the fact that they lose and he wins the money bet on the cards."

The ladies looked at each other in amazement. But, as one of them remarked afterward, the arguments to refute the propositions of the gambler's wife did not seem to occur to any of them.

Gambling on the turf, or in any other mode, undoubtedly tends to great demoralization. Men of the highest repute and of the nicest sense of honor get their notions of right and wrong sadly confused under the temptations of the race-course. A more chivalric, high-toned, and gallant gentleman than General Jackson did not live among his contemporaries. And yet a story was current in Tennessee some fifty years ago—whether true or false I am not able to say—which goes to show that even he was shrewdly suspected of playing his game with the "advantages," in the dainty phraseology of sporting men. The story ran in this wise:

The general became discontented with a mulatto boy, who had been his favorite rider, and sold him to a neighbor, who was his great rival on the turf. The boy was to ride in a very important race against a favorite horse of the general's. Jackson had a heavy bet pending on the race, and he was overheard remonstrating with his late rider. "You black rascal, mind what you are about. None of your old tricks with me. If I catch you squirting your tobacco juice in my boy's eyes I'll cut your heart out!"

This may have been a pure fabrication; but if sharp practice on the turf had not been the rule rather than the exception, an anecdote of this description could not have obtained currency as applied to General Jackson.

I have quoted it not as reflecting any discredit upon a man who stood above reproach among his neighbors, but as indicating the general moral tone which prevailed among turfmen half a century ago. Whether there has been any great improvement in that regard since that time I shall not undertake to decide. That the tendency of gaming of all kinds is to lower the tone of public morals is a proposition that few reflecting men will be inclined to dispute. The pretense that the main purpose of gambling is a pleasurable wholesome excitement, irrespective of the pecuniary consequences of the practice, is too absurd to be maintained for a moment. The love of gain lies at the foundation of all gaming, and every other consideration is subordinated to that overmastering passion.

THE MEXICAN COMMISSION.

The commission to settle the claims of American citizens upon Mexico had many strange cases before it. The board was composed of George Evans, Caleb Smith, of Indiana, afterward Secretary of the Interior under Mr. Lincoln, and Colonel Payne, of North Carolina. The claims were many in number, and enormous in amount. A large portion of them were of undoubted validity, and when supported by adequate proof, were allowed without difficulty. Others were of doubtful character, and these

the commissioners subjected to the most rigid scrutiny. There was one that gave the board a great deal of trouble and perplexity. The claimant was a Dr. Gardiner, originally of Philadelphia. He was a man of imposing appearance and fine address. He pressed his claim with a sort of audacity that excited some suspicion in the board. The whole thing proved to be a fraud in the end, and Gardiner committed suicide to avoid the earthly consequences of his crime. He had practiced dentistry in Mexico, but he had suffered no wrong from the government, nor had he been engaged in any enterprise there upon which to base a claim for indemnity. It was a great scheme of villainy, concocted with much ingenuity, and executed with a degree of boldness and address that set detection at defiance, as against the means ordinarily employed to ascertain the facts in such cases. The scene was laid in a remote and inaccessible part of the country, where the man claimed to have had a productive silver mine, with mills, machinery, and all other necessary appliances for raising and smelting the ore. He alleged that he was working it at an immense profit, making sixty or seventy thousand dollars a year, when he was despoiled of his property, his works destroyed, and he driven out of the country. He employed several eminent counsel, Thomas Corwin, afterward Secretary of the Treasury under Mr. Fillmore, being among the number. The case was made out perfectly. In fact, the proofs were so ample and complete that the commissioners became suspicious of the verity of the evidence. They suspected simulation and forgery, and hesitated about acting finally upon it. The president of the board, Mr. Evans, was specially concerned and distrustful. When the counsel pointed to the mass of evidence by which the claim was supported, he insisted that that of itself was a suspicious circumstance. There was too much of it. A fraudulent claim was certain to be fully sustained. The work of fabrication once begun, the knaves engaged in it were more likely to overwork the case and provoke close scrutiny by the multiplicity of their proofs than to fail by their inadequacy. While the matter was before the board, I went with Mr. Evans to call upon the President, General Taylor. He narrated the circumstances to the President, and suggested that as the amount was so large—the sum demanded being nearly half a million of dollars—a person should be sent to Mexico to ascertain the facts. He said an investigation would probably ascertain that Gardiner had no claim whatever; that as the case then stood the claim could not be rejected. An award to a large amount must be made; and if it should prove to be fraudulent, it would damage the board essentially, and the administration would suffer from the scandal. General Taylor was reluctant to take the responsibility of acting upon the suggestion of Mr. Evans. He seemed to doubt his authority in the premises, and advised an application to Congress. The result was that nothing was done, and an award was finally made in favor of Gardiner, and he drew from the treasury the sum of nearly four hundred thousand dollars. When the fraud was discovered there was a great deal of public clamor, and allegations of connivance and complicity were bruited about, involving several prominent men. But no evidence ever appeared tending to prove that Gardiner had any accomplices in his stupendous scheme of villainy.

There was a degree of form and ceremony about the organization of the board, which was endeavored to be carried out in the proceedings, altogether distasteful to the commissioners, who were practical, sensible men, with no nonsense about them. There was a secretary, a clerk, and two messengers, and these understrappers had contrived to surround the board with a sort of solemn dignity, the reflex of which they expected to enjoy themselves in an enhanced degree of obsequiousness and servility on the part of claimants. This thing was carried so far as to provoke some merriment among gentlemen visiting the commission, and in the board also. A newspaper correspondent, on intimate terms with the gentlemen composing the board, determined to shock the sensitive nerves of the subordinates who had formed such an exaggerated estimate of the dignity and consequence of the concern. Calling in at the antechamber, he desired one of the messengers to inquire whether the board was specially engaged. The negro made the inquiry, and informed the gentleman that the honorable commissioners were considering a case, but they would receive any communication which Mr. —— might wish to make. Entering the presence, he asked if the board was prepared to entertain a proposition which he desired to offer. The secretary and clerk opened their eyes in amazement, confounded by his presumption. The president courteously replied that the board was considering an important case, but would hear any thing which the gentleman might have to propose.

"I move," said he, "that the board adjourn, and go around to Potter's and take a drink."

"Carried unanimously," replied the president, and the sitting was closed for the day.

THE MASON FAMILY.

A gentleman who is recognized as a highly respectable member of Congress some thirty odd years ago sends to the publishers of the magazine, for the benefit of the "Old Stager," some facts relating to the Mason

family of Virginia. The statements in these papers upon the number of relatives in Congress suggested to this gentleman that these facts might be read with interest.

He writes as follows:

"My attention has been attracted by your articles in *Harper's Monthly* as an 'Old Stager.'

"May I take the liberty of calling your attention to several cases of 'relatives in Congress'—one of the heads of your December article. For example, the *Masons*. George Mason was one of the first Senators elected to the Congress of the United States from Virginia under the Constitution. For some cause he never took his seat, however. He was subsequently succeeded by his nephew, Stevens Thompson Mason, in the days of Mr. Jefferson, and who was in his time a leading member of the Senate. He died in 1803. In turn he was succeeded by his own son, the unfortunate Armstead Thompson Mason, who fell in a duel, 1819, with his cousin, Colonel John Mason M'Carty. Subsequently he was followed by his cousin, the grandson of George Mason, viz., James Murray Mason, with whose history the people of the present day are so familiar, and who died about a year ago.

"In the House of Representatives there have been three of the same family and name, viz., John Y. Mason, subsequently Judge of the United States Court, Secretary of the Navy, Attorney-General, and minister to France, where he died about the year 1858, James M. Mason, above referred to, and John Thompson Mason, of Maryland, subsequently Judge of the Court of Appeals of that State—making in all seven representatives of one family and name in the Congress of the United States, besides several others of the same family maternally descended. In addition, there were a number of other members of the same family who held other high positions in the several States. For example, Stevens Thompson Mason, grandson of the former of the same name, was twice Governor of Michigan; Richard B. Mason was the first Governor of California; John Thompson Mason, father of the previously named, was Attorney-General and Chief Justice of Maryland, and United States Attorney for the District of Columbia under Mr. Jefferson; and Thompson F. Mason, grandson of George, was Judge of the United States Circuit Court for the District of Columbia at the time of his death. (See *Appleton's Encyclopedia*.)

"The Reading district of Pennsylvania, now represented by Heister Clymer, was formerly represented by his father and grandfather, and all three were graduates of Princeton College. The same is precisely true as regards the Harford district of Maryland, now represented by Stevenson Archer. He is the successor of his father and grandfather, and all three, as in the case of the Clymers, are graduates of Princeton College.

"The Stocktons of New Jersey are still more remarkable, for I believe there have been, with the present Senator, four generations in the Senate, and all graduates of Princeton."

THE NEW MAGDALEN.

By WILKIE COLLINS.

CHAPTER XXVII.—(*Concluded.*)

MAGDALEN'S APPRENTICESHIP.

"WHAT was it possible for a friendless girl in my position to do, when the full knowledge of the outrage had been revealed to me?

"If I had possessed near and dear relatives to protect and advise me, the wretches into whose hands I had fallen might have felt the penalty of the law. I knew no more of the formalities which set the law in motion than a child. But I had another alternative (you will say). Charitable societies would have received me and helped me, if I had stated my case to them. I knew no more of the charitable societies than I knew of the law. At least, then, I might have gone back to the honest people among whom I had lived? When I recovered my freedom, after the interval of some days, I was ashamed to go back to the honest people. Helplessly and hopelessly, without sin or choice of mine, I drifted, as thousands of other women have drifted, into the life which set a mark on me for the rest of my days.

"Are you surprised at the ignorance which this confession reveals?

"You, who have your solicitors to inform you of legal remedies, and your newspapers, circulars, and active friends to sound the praises of charitable institutions continually in your ears—you, who possess these advantages, have no idea of the outer world of ignorance in which your lost fellow-creatures live. They know nothing (unless they are rogues accustomed to prey on society) of your benevolent schemes to help them. The purpose of public charities, and the way to discover and apply to them, ought to be posted at the corner of every street. What do *we* know of public dinners and eloquent sermons and neatly printed circulars? Every now and then the case of some forlorn creature (generally of a woman) who has committed suicide, within five minutes' walk, perhaps, of an Institution which would have opened its doors to her, appears in the newspapers, shocks you dreadfully, and is then forgotten again. Take as much pains to make charities and asylums known among the people *without* money as are taken to make a new play, a new journal, or a new medicine known among the people *with* money, and you will save many a lost creature who is perishing now.

"You will forgive and understand me if I say no more of this period of my life. Let me pass to the new incident in my career which brought me for the second time before the public notice in a court of law.

"Sad as my experience has been, it has not taught me to think ill of human nature. I had found kind hearts to feel for me in my former troubles; and I had friends—faithful, self-denying, generous friends—among my sisters in adversity now. One of these poor women (she has gone, I am glad to think, from the world that used her so hard-

ly) especially attracted my sympathies. She was the gentlest, the most unselfish creature I have ever met with. We lived together like sisters. More than once, in the dark hours when the thought of self-destruction comes to a desperate woman, the image of my poor devoted friend, left to suffer alone, rose in my mind and restrained me. You will hardly understand it, but even we had our happy days. When she or I had a few shillings to spare, we used to offer one another little presents, and enjoy our simple pleasure in giving and receiving as keenly as if we had been the most reputable women living.

"One day I took my friend into a shop to buy her a ribbon—only a bow for her dress. She was to choose it, and I was to pay for it, and it was to be the prettiest ribbon that money could buy.

"The shop was full; we had to wait a little before we could be served.

"Next to me, as I stood at the counter with my companion, was a gaudily dressed woman, looking at some handkerchiefs. The handkerchiefs were finely embroidered, but the smart lady was hard to please. She tumbled them up disdainfully in a heap, and asked for other specimens from the stock in the shop. The man, in clearing the handkerchiefs out of the way, suddenly missed one. He was quite sure of it, from a peculiarity in the embroidery which made the handkerchief especially noticeable. I was poorly dressed, and I was close to the handkerchiefs. After one look at me he shouted to the superintendent, 'Shut the door! There is a thief in the shop!'

"The door was closed; the lost handkerchief was vainly sought for on the counter and on the floor. A robbery had been committed; and I was accused of being the thief.

"I will say nothing of what I felt—I will only tell you what happened.

"I was searched, and the handkerchief was discovered on me. The woman who had stood next to me, on finding herself threatened with discovery, had no doubt contrived to slip the stolen handkerchief into my pocket. Only an accomplished thief could have escaped detection in that way without my knowledge. It was useless, in the face of the facts, to declare my innocence. I had no character to appeal to. My friend tried to speak for me; but what was she? Only a lost woman like myself. My landlady's evidence in favor of my honesty produced no effect; it was against her that she let lodgings to people in my position. I was prosecuted, and found guilty. The tale of my disgrace is now complete, Mr. Holmcroft. No matter whether I was innocent or not, the shame of it remains—I have been imprisoned for theft.

"The matron of the prison was the next person who took an interest in me. She reported favorably of my behavior to the authorities; and when I had served my time (as the phrase was among us) she gave me a letter to the kind friend and guardian of my later years—to the lady who is coming here to take me back with her to the Refuge.

"From this time the story of my life is little more than the story of a woman's vain efforts to recover her lost place in the world.

"The matron, on receiving me into the Refuge, frankly acknowledged that there were terrible obstacles in my way. But she saw that I was sincere, and she felt a good woman's sympathy and compassion for me. On my side, I did not shrink from beginning the slow and weary journey back again to a reputable life from the humblest starting-point—from domestic service. After first earning my new character in the Refuge, I obtained a trial in a respectable house. I worked hard, and worked uncomplainingly; but my mother's fatal legacy was against me from the first. My personal appearance excited remark; my manners and habits were not the manners and habits of the women among whom my lot was cast. I tried one place after another—always with the same results. Suspicion and jealousy I could endure; but I was defenseless when curiosity assailed me in its turn. Sooner or later inquiry led to discovery. Sometimes the servants threatened to give warning in a body—and I was obliged to go. Sometimes, where there was a young man in the family, scandal pointed at me and at him—and again I was obliged to go. If you care to know it, Miss Roseberry can tell you the story of those sad days. I confided it to her on the memorable night when we met in the French cottage; I have no heart to repeat it now. After a while I wearied of the hopeless struggle. Despair laid its hold on me—I lost all hope in the mercy of God. More than once I walked to one or other of the bridges, and looked over the parapet at the river, and said to myself, 'Other women have done it: why shouldn't I?'

"You saved me at that time, Mr. Gray—as you have saved me since. I was one of your congregation when you preached in the chapel of the Refuge. You reconciled others besides me to our hard pilgrimage. In their name and in mine, Sir, I thank you.

"I forget how long it was after the bright day when you comforted and sustained us that the war broke out between France and Germany. But I can never forget the evening when the matron sent for me into her own room and said, 'My dear, your life here is a wasted life. If you have courage enough left to try it, I can give you another chance.'

"I passed through a month of probation in a London hospital. A week after that I wore the red cross of the Geneva Convention—I was appointed nurse in a French ambulance. When you first saw me, Mr. Holm-

croft, I still had my nurse's dress on, hidden from you and from every body under a gray cloak.

"You know what the next event was; you know how I entered this house.

"I have not tried to make the worst of my trials and troubles in telling you what my life has been. I have honestly described it for what it was when I met with Miss Roseberry—a life without hope. May you never know the temptation that tried me when the shell struck its victim in the French cottage! There she lay—dead! *Her* name was untainted. *Her* future promised me the reward which had been denied to the honest efforts of a penitent woman. My lost place in the world was offered back to me on the one condition that I stooped to win it by a fraud. I had no prospect to look forward to; I had no friend near to advise me and to save me; the fairest years of my womanhood had been wasted in the vain struggle to recover my good name. Such was my position when the possibility of personating Miss Roseberry first forced itself on my mind. Impulsively, recklessly—wickedly, if you like—I seized the opportunity, and let you pass me through the German lines under Miss Roseberry's name. Arrived in England, having had time to reflect, I made my first and last effort to draw back before it was too late. I went to the Refuge, and stopped on the opposite side of the street, looking at it. The old hopeless life of irretrievable disgrace confronted me as I fixed my eyes on the familiar door; the horror of returning to that life was more than I could force myself to endure. An empty cab passed me at the moment. The driver held up his hand. In sheer despair I stopped him, and when he said 'Where to?' in sheer despair again I answered, 'Mablethorpe House.'

"Of what I have suffered in secret since my own successful deception established me under Lady Janet's care I shall say nothing. Many things which must have surprised you in my conduct are made plain to you by this time. You must have noticed long since that I was not a happy woman. Now you know why.

"My confession is made; my conscience has spoken at last. You are released from your promise to me—you are free. Thank Mr. Julian Gray if I stand here self-accused of the offense that I have committed, before the man whom I have wronged."

CHAPTER XXVIII.

SENTENCE IS PRONOUNCED ON HER.

It was done. The last tones of her voice died away in silence.

Her eyes still rested on Horace. After hearing what he had heard, could he resist that gentle pleading look? Would he forgive her? A while since Julian had seen tears on his cheeks, and had believed that he felt for her. Why was he now silent? Was it possible that he only felt for himself?

For the last time—at the crisis of her life—Julian spoke for her. He had never loved her as he loved her at that moment; it tried even his generous nature to plead her cause with Horace against himself. But he had promised her, without reserve, all the help that her truest friend could offer. Faithfully and manfully he redeemed his promise.

"Horace!" he said.

Horace slowly looked up. Julian rose and approached him.

"She has told you to thank *me*, if her conscience has spoken. Thank the noble nature which answered when I called upon it! Own the priceless value of a woman who can speak the truth. Her heart-felt repentance is a joy in heaven. Shall it not plead for her on earth? Honor her, if you are a Christian! Feel for her, if you are a man!"

He waited. Horace never answered him.

Mercy's eyes turned tearfully on Julian. *His* heart was the heart that felt for her! *His* words were the words which comforted and pardoned her! When she looked back again at Horace it was with an effort. His last hold on her was lost. In her inmost mind a thought rose unbidden—a thought which was not to be repressed. "Can I ever have loved this man?"

She advanced a step toward him; it was not possible, even yet, to completely forget the past. She held out her hand.

He rose, on his side—without looking at her.

"Before we part forever," she said to him, "will you take my hand as a token that you forgive me?"

He hesitated. He half lifted his hand. The next moment the generous impulse died away in him. In its place came the mean fear of what might happen if he trusted himself to the dangerous fascination of her touch. His hand dropped again at his side; he turned away quickly.

"I can't forgive her!" he said.

With that horrible confession—without even a last look at her—he left the room.

At the moment when he opened the door Julian's contempt for him burst its way through all restraints.

"Horace," he said, "I pity you!"

As the words escaped him he looked back at Mercy. She had turned aside from both of them—she had retired to a distant part of the library. The first bitter foretaste of what was in store for her when she faced the world again had come to her from Horace! The energy which had sustained her thus far quailed before the dreadful prospect—

doubly dreadful to a woman—of obloquy and contempt. She sank on her knees before a little couch in the darkest corner of the room. "O Christ, have mercy on me!" That was her prayer—no more.

Julian followed her. He waited a little. Then his kind hand touched her; his friendly voice fell consolingly on her ear.

"Rise, poor wounded heart! Beautiful, purified soul, God's angels rejoice over you! Take your place among the noblest of God's creatures!"

He raised her as he spoke. All her heart went out to him. She caught his hand—she pressed it to her bosom; she pressed it to her lips—then dropped it suddenly, and stood before him trembling like a frightened child.

"Forgive me!" was all she could say. "I was so lost and lonely—and you are so good to me!"

She tried to leave him. It was useless—her strength was gone; she caught at the head of the couch to support herself. He looked at her. The confession of his love was just rising to his lips—he looked again, and checked it. No, not at that moment; not when she was helpless and ashamed; not when her weakness might make her yield, only to regret it at a later time. The great heart which had spared her and felt for her from the first spared her and felt for her now.

He, too, left her—but not without a word at parting.

"Don't think of your future life just yet," he said, gently. "I have something to propose when rest and quiet have restored you." He opened the nearest door—the door of the dining-room—and went out.

The servants engaged in completing the decoration of the dinner-table noticed, when "Mr. Julian" entered the room, that his eyes were "brighter than ever." He looked (they remarked) like a man who "expected good news." They were inclined to suspect—though he was certainly rather young for it—that her ladyship's nephew was in a fair way of preferment in the Church.

Mercy seated herself on the couch.

There are limits, in the physical organization of man, to the action of pain. When suffering has reached a given point of intensity the nervous sensibility becomes incapable of feeling more. The rule of Nature, in this respect, applies not only to sufferers in the body, but to sufferers in the mind as well. Grief, rage, terror, have also their appointed limits. The moral sensibility, like the nervous sensibility, reaches its period of absolute exhaustion, and feels no more.

The capacity for suffering in Mercy had attained its term. Alone in the library, she could feel the physical relief of repose; she could vaguely recall Julian's parting words to her, and sadly wonder what they meant—and she could do no more.

An interval passed; a brief interval of perfect rest.

She recovered herself sufficiently to be able to look at her watch and to estimate the lapse of time that might yet pass before Julian returned to her as he had promised. While her mind was still languidly following this train of thought she was disturbed by the ringing of a bell in the hall, used to summon the servant whose duties were connected with that part of the house. In leaving the library Horace had gone out by the door which led into the hall, and had failed to close it. She plainly heard the bell—and a moment later (more plainly still) she heard Lady Janet's voice!

She started to her feet. Lady Janet's letter was still in the pocket of her apron—the letter which imperatively commanded her to abstain from making the very confession that had just passed her lips! It was near the dinner hour, and the library was the favorite place in which the mistress of the house and her guests assembled at that time. It was no matter of doubt; it was an absolute certainty that Lady Janet had only stopped in the hall on her way into the room.

The alternative for Mercy lay between instantly leaving the library by the dining-room door—or remaining where she was, at the risk of being sooner or later compelled to own that she had deliberately disobeyed her benefactress. Exhausted by what she had already suffered, she stood trembling and irresolute, incapable of deciding which alternative she should choose.

Lady Janet's voice, clear and resolute, penetrated into the room. She was reprimanding the servant who had answered the bell.

"Is it your duty in my house to look after the lamps?"

"Yes, my lady."

"And is it my duty to pay you your wages?"

"If you please, my lady."

"Why do I find the light in the hall dim, and the wick of that lamp smoking? I have not failed in my duty to You. Don't let me find you failing again in your duty to Me."

(Never had Lady Janet's voice sounded so sternly in Mercy's ear as it sounded now. If she spoke with that tone of severity to a servant who had neglected a lamp, what had her adopted daughter to expect when she discovered that her entreaties and her commands had been alike set at defiance?)

Having administered her reprimand, Lady Janet had not done with the servant yet. She had a question to put to him next.

"Where is Miss Roseberry?"

"In the library, my lady."

Mercy returned to the couch. She could

stand no longer; she had not even resolution enough left to lift her eyes to the door.

Lady Janet came in more rapidly than usual. She advanced to the couch, and tapped Mercy playfully on the cheek with two of her fingers.

"You lazy child! Not dressed for dinner? Oh, fie, fie!"

Her tone was as playfully affectionate as the action which had accompanied her words. In speechless astonishment Mercy looked up at her.

Always remarkable for the taste and splendor of her dress, Lady Janet had on this occasion surpassed herself. There she stood revealed in her grandest velvet, her richest jewelry, her finest lace—with no one to entertain at the dinner-table but the ordinary members of the circle at Mablethorpe House. Noticing this as strange to begin with, Mercy further observed, for the first time in her experience, that Lady Janet's eyes avoided meeting hers. The old lady took her place companionably on the couch; she ridiculed her "lazy child's" plain dress, without an ornament of any sort on it, with her best grace; she affectionately put her arm round Mercy's waist, and rearranged with her own hand the disordered locks of Mercy's hair—but the instant Mercy herself looked at her, Lady Janet's eyes discovered something supremely interesting in the familiar objects that surrounded her on the library walls.

How were these changes to be interpreted? To what possible conclusion did they point?

Julian's profounder knowledge of human nature, if Julian had been present, might have found a clew to the mystery. *He* might have surmised (incredible as it was) that mercy's timidity before Lady Janet was fully reciprocated by Lady Janet's timidity before Mercy. It was even so. The woman whose immovable composure had conquered Grace Roseberry's utmost insolence in the hour of her triumph—the woman who, without once flinching, had faced every other consequence of her resolution to ignore Mercy's true position in the house—quailed for the first time when she found herself face to face with the very person for whom she had suffered and sacrificed so much. She had shrunk from the meeting with Mercy, as Mercy had shrunk from the meeting with *her*. The splendor of her dress meant simply that, when other excuses for delaying the meeting down stairs had all been exhausted, the excuse of a long and elaborate toilet had been tried next. Even the moments occupied in reprimanding the servant had been moments seized on as the pretext for another delay. The hasty entrance into the room, the nervous assumption of playfulness in language and manner, the evasive and wandering eyes, were all referable to the same cause. In the presence of others, Lady Janet had successfully silenced the protest of her own inbred delicacy and inbred sense of honor. In the presence of Mercy, whom she loved with a mother's love—in the presence of Mercy, for whom she had stooped to deliberate concealment of the truth—all that was high and noble in the woman's nature rose in her and rebuked her. What will the daughter of my adoption, the child of my first and last experience of maternal love, think of me, now that I have made myself an accomplice in the fraud of which she is ashamed? How can I look her in the face, when I have not hesitated, out of selfish consideration for my own tranquillity, to forbid that frank avowal of the truth which her finer sense of duty had spontaneously bound her to make? Those were the torturing questions in Lady Janet's mind, while her arm was wound affectionately round Mercy's waist, while her fingers were busying themselves familiarly with the arrangement of Mercy's hair. Thence, and thence only, sprang the impulse which set her talking, with an uneasy affectation of frivolity, of any topic within the range of conversation, so long as it related to the future, and completely ignored the present and the past.

"The winter here is unendurable," Lady Janet began. "I have been thinking, Grace, about what we had better do next."

Mercy started. Lady Janet had called her "Grace." Lady Janet was still deliberately assuming to be innocent of the faintest suspicion of the truth.

"No," resumed her ladyship, affecting to misunderstand Mercy's movement, "you are not to go up now and dress. There is no time, and I am quite ready to excuse you. You are a foil to me, my dear. You have reached the perfection of shabbiness. Ah! I remember when I had my whims and fancies too, and when I looked well in any thing I wore, just as you do. No more of that. As I was saying, I have been thinking and planning what we are to do. We really can't stay here. Cold one day, and hot the next—what a climate! As for society, what do we lose if we go away? There is no such thing as society now. Assemblies of well-dressed mobs meet at each other's houses, tear each other's clothes, tread on each other's toes. If you are particularly lucky you sit on the staircase, you get a tepid ice, and you hear vapid talk in slang phrases all round you. There is modern society. If we had a good opera, it would be something to stay in London for. Look at the programme for the season on that table—promising as much as possible on paper, and performing as little as possible on the stage. The same works, sung by the same singers year after year, to the same stupid people—in short, the dullest musical evenings in Europe. No! the more I think of it, the more plainly I perceive that there is but one sensi-

ble choice before us: we must go abroad. Set that pretty head to work; choose north or south, east or west; it's all the same to me. Where shall we go?"

Mercy looked at her quickly as she put the question.

Lady Janet, more quickly yet, looked away at the programme of the opera-house. Still the same melancholy false pretenses! still the same useless and cruel delay! Incapable of enduring the position now forced upon her, Mercy put her hand into the pocket of her apron, and drew from it Lady Janet's letter.

"Will your ladyship forgive me," she began, in faint, faltering tones, "if I venture on a painful subject? I hardly dare acknowledge—" In spite of her resolution to speak out plainly, the memory of past love and past kindness prevailed with her; the next words died away on her lips. She could only hold up the letter.

Lady Janet declined to see the letter. Lady Janet suddenly became absorbed in the arrangement of her bracelets.

"I know what you daren't acknowledge, you foolish child!" she exclaimed. "You daren't acknowledge that you are tired of this dull house. My dear! I am entirely of your opinion—I am weary of my own magnificence; I long to be living in one snug little room, with one servant to wait on me. I'll tell you what we will do. We will go to Paris in the first place. My excellent Migliore, prince of couriers, shall be the only person in attendance. He shall take a lodging for us in one of the unfashionable quarters of Paris. We will rough it, Grace (to use the slang phrase), merely for a change. We will lead what they call a 'Bohemian life.' I know plenty of writers and painters and actors in Paris—the liveliest society in the world, my dear, until one gets tired of them. We will dine at the restaurant, and go to the play, and drive about in shabby little hired carriages. And when it begins to get monotonous (which it is only too sure to do!) we will spread our wings and fly to Italy, and cheat the winter in that way. There is a plan for you! Migliore is in town. I will send to him this evening, and we will start to-morrow."

Mercy made another effort.

"I entreat your ladyship to pardon me," she resumed. "I have something serious to say. I am afraid—"

"I understand! You are afraid of crossing the Channel, and you don't like to acknowledge it. Pooh! The passage barely lasts two hours; we will shut ourselves up in a private cabin. I will send at once—the courier may be engaged. Ring the bell."

"Lady Janet, I must submit to my hard lot. I can not hope to associate myself again with any future plans of yours—"

"What! you are afraid of our 'Bohemian life' in Paris? Observe this, Grace! If there is one thing I hate more than another, it is 'an old head on young shoulders.' I say no more. Ring the bell."

"This can not go on, Lady Janet! No words can say how unworthy I feel of your kindness, how ashamed I am—"

"Upon my honor, my dear, I agree with you. You *ought* to be ashamed, at your age, of making me get up to ring the bell."

Her obstinacy was immovable; she attempted to rise from the couch. But one choice was left to Mercy. She anticipated Lady Janet, and rang the bell.

The man-servant came in. He had his little letter-tray in his hand, with a card on it, and a sheet of paper beside the card, which looked like an open letter.

"You know where my courier lives when he is in London?" asked Lady Janet.

"Yes, my lady."

"Send one of the grooms to him on horseback; I am in a hurry. The courier is to come here without fail to-morrow morning—in time for the tidal train to Paris. You understand?"

"Yes, my lady."

"What have you got there? Any thing for me?"

"For Miss Roseberry, my lady."

As he answered, the man handed the card and the open letter to Mercy.

"The lady is waiting in the morning-room, miss. She wished me to say she has time to spare, and she will wait for you if you are not ready yet."

Having delivered his message in those terms, he withdrew.

Mercy read the name on the card. The matron had arrived! She looked at the letter next. It appeared to be a printed circular, with some lines in pencil added on the empty page. Printed lines and written lines swam before her eyes. She felt, rather than saw, Lady Janet's attention steadily and suspiciously fixed on her. With the matron's arrival the foredoomed end of the flimsy false pretenses and the cruel delays had come.

"A friend of yours, my dear?"

"Yes, Lady Janet."

"Am I acquainted with her?"

"I think not, Lady Janet."

"You appear to be agitated. Does your visitor bring bad news? Is there any thing that I can do for you?"

"You can add—immeasurably add, madam—to all your past kindness, if you will only bear with me and forgive me."

"Bear with you and forgive you? I don't understand."

"I will try to explain. Whatever else you may think of me, Lady Janet, for God's sake don't think me ungrateful!"

Lady Janet held up her hand for silence.

"I dislike explanations," she said, sharply. "Nobody ought to know that better

than you. Perhaps the lady's letter will explain for you. Why have you not looked at it yet?"

"I am in great trouble, madam, as you noticed just now—"

"Have you any objection to my knowing who your visitor is?"

"No, Lady Janet."

"Let me look at her card, then."

Mercy gave the matron's card to Lady Janet, as she had given the matron's telegram to Horace.

Lady Janet read the name on the card—considered—decided that it was a name quite unknown to her—and looked next at the address: "Western District Refuge, Milburn Road."

"A lady connected with a Refuge?" she said, speaking to herself; "and calling here by appointment—if I remember the servant's message? A strange time to choose, if she has come for a subscription!"

She paused. Her brow contracted; her face hardened. A word from her would now have brought the interview to its inevitable end, and she refused to speak the word. To the last moment she persisted in ignoring the truth! Placing the card on the couch at her side, she pointed with her long yellow-white forefinger to the printed letter lying side by side with her own letter on Mercy's lap.

"Do you mean to read it, or not?" she asked.

Mercy lifted her eyes, fast filling with tears, to Lady Janet's face.

"May I beg that your ladyship will read it for me?" she said—and placed the matron's letter in Lady Janet's hand.

It was a printed circular announcing a new development in the charitable work of the Refuge. Subscribers were informed that it had been decided to extend the shelter and the training of the institution (thus far devoted to fallen women alone) so as to include destitute and helpless children found wandering in the streets. The question of the number of children to be thus rescued and protected was left dependent, as a matter of course, on the bounty of the friends of the Refuge, the cost of the maintenance of each one child being stated at the lowest possible rate. A list of influential persons who had increased their subscriptions so as to cover the cost, and a brief statement of the progress already made with the new work, completed the appeal, and brought the circular to its end.

The lines traced in pencil (in the matron's handwriting) followed on the blank page.

"Your letter tells me, my dear, that you would like—remembering your own childhood—to be employed when you return among us in saving other poor children left helpless on the world. Our circular will inform you that I am able to meet your wishes. My first errand this evening in your neighborhood was to take charge of a poor child—a little girl—who stands sadly in need of our care. I have ventured to bring her with me, thinking she might help to reconcile you to the coming change in your life. You will find us both waiting to go back with you to the old home. I write this instead of saying it, hearing from the servant that you are not alone, and being unwilling to intrude myself, as a stranger, on the lady of the house."

Lady Janet read the penciled lines, as she had read the printed sentences, aloud. Without a word of comment she laid the letter where she had laid the card; and, rising from her seat, stood for a moment in stern silence, looking at Mercy. The sudden change in her which the letter had produced—quietly as it had taken place—was terrible to see. On the frowning brow, in the flashing eyes, on the hardened lips, outraged love and outraged pride looked down on the lost woman, and said, as if in words, You have roused us at last.

"If that letter means any thing," she said, "it means you are about to leave my house. There can be but one reason for your taking such a step as that."

"It is the only atonement I can make, madam—"

"I see another letter on your lap. Is it *my* letter?"

"Yes."

"Have you read it?"

"I have read it."

"Have you seen Horace Holmcroft?"

"Yes."

"Have you told Horace Holmcroft—"

"Oh, Lady Janet—"

"Don't interrupt me. Have you told Horace Holmcroft what my letter positively forbade you to communicate, either to him or to any living creature? I want no protestations and excuses. Answer me instantly, and answer in one word—Yes, or No."

Not even that haughty language, not even those pitiless tones, could extinguish in Mercy's heart the sacred memories of past kindness and past love. She fell on her knees—her outstretched hands touched Lady Janet's dress. Lady Janet sharply drew her dress away, and sternly repeated her last words.

"Yes? or No?"

"Yes."

She had owned it at last! To this end Lady Janet had submitted to Grace Roseberry; had offended Horace Holmcroft; had stooped for the first time in her life to concealments and compromises that degraded her. After all that she had sacrificed and suffered, there Mercy knelt at her feet, self-convicted of violating her commands, trampling on her feelings, deserting her house! And who was the woman who had done this? The same woman who had perpetrated the fraud,

and who had persisted in the fraud until her benefactress had descended to become her accomplice. Then, and then only, she had suddenly discovered that it was her sacred duty to tell the truth!

In proud silence the great lady met the blow that had fallen on her. In proud silence she turned her back on her adopted daughter and walked to the door.

Mercy made her last appeal to the kind friend whom she had offended—to the second mother whom she had loved.

"Lady Janet! Lady Janet! Don't leave me without a word. Oh, madam, try to feel for me a little! I am returning to a life of humiliation—the shadow of my old disgrace is falling on me once more. We shall never meet again. Even though I have not deserved it, let my repentance plead with you! Say you forgive me!"

Lady Janet turned round on the threshold of the door.

"I never forgive ingratitude," she said. "Go back to the Refuge."

The door opened, and closed on her. Mercy was alone again in the room.

Unforgiven by Horace, unforgiven by Lady Janet! She put her hands to her burning head, and tried to think. Oh, for the cool air of the night! Oh, for the friendly shelter of the Refuge! She could feel those sad longings in her: it was impossible to think.

She rang the bell—and shrank back the instant she had done it. Had *she* any right to take that liberty? She ought to have thought of it before she rang. Habit—all habit. How many hundreds of times she had rung the bell at Mablethorpe House!

The servant came in. She amazed the man—she spoke to him so timidly: she even apologized for troubling him!

"I am sorry to disturb you. Will you be so kind as to say to the lady that I am ready for her?"

"Wait to give that message," said a voice behind them, "until you hear the bell rung again."

Mercy looked round in amazement. Julian had returned to the library by the dining-room door.

CHAPTER XXIX.

THE LAST TRIAL.

THE servant left them together. Mercy spoke first.

"Mr. Gray!" she exclaimed, "why have you delayed my message? If you knew all, you would know that it is far from being a kindness to me to keep me in this house."

He advanced closer to her—surprised by her words, alarmed by her looks.

"Has any one been here in my absence?" he asked.

"Lady Janet has been here in your absence. I can't speak of it—my heart feels crushed—I can bear no more. Let me go!"

Briefly as she had replied, she had said enough. Julian's knowledge of Lady Janet's character told him what had happened. His face showed plainly that he was disappointed as well as distressed.

"I had hoped to have been with you when you and my aunt met, and to have prevented this," he said. "Believe me, she will atone for all that she may have harshly and hastily done when she has had time to think. Try not to regret it, if she has made your hard sacrifice harder still. She has only raised you the higher—she has additionally ennobled you and endeared you in my estimation. Forgive me if I own this in plain words. I can not control myself—I feel too strongly."

At other times Mercy might have heard the coming avowal in his tones, might have discovered it in his eyes. As it was, her delicate insight was dulled, her fine perception was blunted. She held out her hand to him, feeling a vague conviction that he was kinder to her than ever—and feeling no more.

"I must thank you for the last time," she said. "As long as life is left, my gratitude will be a part of my life. Let me go. While I can still control myself, let me go!"

She tried to leave him, and ring the bell. He held her hand firmly and drew her closer to him.

"To the Refuge?" he asked.

"Yes," she said. "Home again!"

"Don't say that!" he exclaimed. "I can't bear to hear it. Don't call the Refuge your home!"

"What else is it? Where else can I go?"

"I have come here to tell you. I said, if you remember, I had something to propose."

She felt the fervent pressure of his hand; she saw the mounting enthusiasm flashing in his eyes. Her weary mind roused itself a little. She began to tremble under the electric influence of his touch.

"Something to propose?" she repeated. "What is there to propose?"

"Let me ask you a question on my side. What have you done to-day?"

"You know what I have done: it is your work," she answered, humbly. "Why return to it now?"

"I return to it for the last time; I return to it with a purpose which you will soon understand. You have abandoned your marriage engagement; you have forfeited Lady Janet's love; you have ruined all your worldly prospects; you are now returning, self-devoted, to a life which you have yourself described as a life without hope. And all this you have done of your own free-will—at a time when you are absolutely secure of your position in the house—for the sake of speaking the truth. Now tell me, is a woman who can make that sacrifice a woman

who will prove unworthy of the trust if a man places in her keeping his honor and his name?"

She understood him at last. She broke away from him with a cry. She stood with her hands clasped, trembling and looking at him.

He gave her no time to think. The words poured from his lips without conscious will or conscious effort of his own.

"Mercy, from the first moment when I saw you I loved you! You are free; I may own it; I may ask you to be my wife!"

She drew back from him farther and farther, with a wild imploring gesture of her hand.

"No! no!" she cried. "Think of what you are saying! think of what you would sacrifice! It can not, must not be."

His face darkened with a sudden dread. His head fell on his breast. His voice sank so low that she could barely hear it.

"I had forgotten something," he said. "You have reminded me of it."

She ventured back a little nearer to him. "Have I offended you?"

He smiled sadly. "You have enlightened me. I had forgotten that it doesn't follow, because I love you, that you should love me in return. Say that it is so, Mercy, and I leave you."

A faint tinge of color rose on her face—then left it again paler than ever. Her eyes looked downward timidly under the eager gaze that he fastened on her.

"How *can* I say so?" she answered, simply. "Where is the woman in my place whose heart could resist you?"

He eagerly advanced; he held out his arms to her in breathless, speechless joy. She drew back from him once more with a look that horrified him—a look of blank despair.

"Am *I* fit to be your wife?" she asked. "Must *I* remind you of what you owe to your high position, your spotless integrity, your famous name? Think of all that you have done for me, and then think of the black ingratitude of it if I ruin you for life by consenting to our marriage—if I selfishly, cruelly, wickedly, drag you down to the level of a woman like me!"

"I raise you to *my* level when I make you my wife," he answered. "For Heaven's sake do me justice! Don't refer me to the world and its opinions. It rests with you, and you alone, to make the misery or the happiness of my life. The world! Good God! what can the world give me in exchange for You?"

She clasped her hands imploringly; the tears flowed fast over her cheeks.

"Oh, have pity on my weakness!" she cried. "Kindest, best of men, help me to do my hard duty toward you! It is *so* hard, after all that I have suffered—when my heart is yearning for peace and happiness and love!" She checked herself, shuddering at the words that had escaped her. "Remember how Mr. Holmcroft has used me! Remember how Lady Janet has left me! Remember what I have told you of my life! The scorn of every creature you know would strike at you through me. No! no! no! Not a word more. Spare me! pity me! leave me!"

Her voice failed her; sobs choked her utterance. He sprang to her and took her in his arms. She was incapable of resisting him; but there was no yielding in her. Her head lay on his bosom, passive—horribly passive, like the head of a corpse.

"Mercy! My darling! We will go away—we will leave England—we will take refuge among new people, in a new world—I will change my name—I will break with relatives, friends, every body. Any thing, any thing, rather than lose you!"

She lifted her head slowly and looked at him.

He suddenly released her; he reeled back like a man staggered by a blow, and dropped into a chair. Before she had uttered a word he saw the terrible resolution in her face—Death, rather than yield to her own weakness and disgrace him.

She stood with her hands lightly clasped in front of her. Her grand head was raised; her soft gray eyes shone again undimmed by tears. The storm of emotion had swept over her and had passed away. A sad tranquillity was in her face; a gentle resignation was in her voice. The calm of a martyr was the calm that confronted him as she spoke her last words.

"A woman who has lived my life, a woman who has suffered what I have suffered, may love you—as *I* love you—but she must not be your wife. *That* place is too high above her. Any other place is too far below her and below you." She paused, and advancing to the bell, gave the signal for her departure. That done, she slowly retraced her steps until she stood at Julian's side.

Tenderly she lifted his head and laid it for a moment on her bosom. Silently she stooped and touched his forehead with her lips. All the gratitude that filled her heart and all the sacrifice that rent it were in those two actions—so modestly, so tenderly performed! As the last lingering pressure of her fingers left him, Julian burst into tears.

The servant answered the bell. At the moment when he opened the door a woman's voice was audible in the hall speaking to him.

"Let the child go in," the voice said. "I will wait here."

The child appeared—the same forlorn little creature who had reminded Mercy of her own early years on the day when she and Horace Holmcroft had been out for their walk.

There was no beauty in *this* child; no halo of romance brightened the commonplace horror of her story. She came cringing into the room, staring stupidly at the magnificence all round her—the daughter of the London streets! the pet creation of the laws of political economy! the savage and terrible product of a worn-out system of government and of a civilization rotten to its core! Cleaned for the first time in her life, fed sufficiently for the first time in her life, dressed in clothes instead of rags for the first time in her life, Mercy's sister in adversity crept fearfully over the beautiful carpet, and stopped wonder-struck before the marbles of an inlaid table—a blot of mud on the splendor of the room.

Mercy turned from Julian to meet the child. The woman's heart, hungering in its horrible isolation for something that it might harmlessly love, welcomed the rescued waif of the streets as a consolation sent from God. She caught the stupefied little creature up in her arms. "Kiss me!" she whispered, in the reckless agony of the moment. "Call me sister!" The child stared vacantly. Sister meant nothing to her mind but an older girl who was strong enough to beat her.

She put the child down again, and turned for a last look at the man whose happiness she had wrecked—in pity to *him*.

He had never moved. His head was down; his face was hidden. She went back to him a few steps.

"The others have gone from me without one kind word. Can *you* forgive me?"

He held out his hand to her without looking up. Sorely as she had wounded him, his generous nature understood her. True to her from the first, *he* was true to her still.

"God bless and comfort you," he said, in broken tones. "The earth holds no nobler woman than you."

She knelt and kissed the kind hand that pressed hers for the last time. "It doesn't end with this world," she whispered: "there is a better world to come!" Then she rose, and went back to the child. Hand in hand the two citizens of the Government of God—outcasts of the Government of Man—passed slowly down the length of the room. Then out into the hall. Then out into the night. The heavy clang of the closing door tolled the knell of their departure. They were gone.

But the orderly routine of the house—inexorable as death—pursued its appointed course. As the clock struck the hour the dinner-bell rang. An interval of a minute passed, and marked the limit of delay. The butler appeared at the dining-room door.

"Dinner is served, Sir."

Julian looked up. The empty room met his eyes. Something white lay on the carpet close by him. It was her handkerchief—wet with her tears. He took it up and pressed it to his lips. Was that to be the last of her? Had she left him forever?

The native energy of the man, arming itself with all the might of his love, kindled in him again. No! While life was in him, while time was before him, there was the hope of winning her yet!

He turned to the servant, reckless of what his face might betray.

"Where is Lady Janet?"

"In the dining-room, Sir."

He reflected for a moment. His own influence had failed. Through what other influence could he now hope to reach her? As the question crossed his mind the light broke on him. He saw the way back to her—through the influence of Lady Janet.

"Her ladyship is waiting, Sir."

Julian entered the dining-room.

EPILOGUE:

CONTAINING SELECTIONS FROM THE CORRESPONDENCE OF MISS GRACE ROSEBERRY AND MR. HORACE HOLMCROFT; TO WHICH ARE ADDED EXTRACTS FROM THE DIARY OF THE REVEREND JULIAN GRAY.

I.

From MR. HORACE HOLMCROFT *to* MISS GRACE ROSEBERRY.

"I HASTEN to thank you, dear Miss Roseberry, for your last kind letter, received by yesterday's mail from Canada. Believe me, I appreciate your generous readiness to pardon and forget what I so rudely said to you at a time when the arts of an adventuress had blinded me to the truth. In the grace which has forgiven me I recognize the inbred sense of justice of a true lady. Birth and breeding can never fail to assert themselves: I believe in them, thank God, more firmly than ever.

"You ask me to keep you informed of the progress of Julian Gray's infatuation, and of the course of conduct pursued toward him by Mercy Merrick.

"If you had not favored me by explaining your object, I might have felt some surprise at receiving from a lady in your position such a request as this. But the motives by which you describe yourself as being actuated are beyond dispute. The existence of Society, as you truly say, is threatened by the present lamentable prevalence of Liberal ideas throughout the length and breadth of the land. We can only hope to protect ourselves against impostors interested in gaining a position among persons of our rank by becoming in some sort (unpleasant as it may be) familiar with the arts by which imposture too frequently succeeds. If we wish to know to what daring lengths cunning can go, to what pitiable self-delusion credulity

can consent, we must watch the proceedings —even while we shrink from them—of a Mercy Merrick and a Julian Gray.

"In taking up my narrative again, where my last letter left off, I must venture to set you right on one point.

"Certain expressions which have escaped your pen suggest to me that you blame Julian Gray as the cause of Lady Janet's regretable visit to the Refuge the day after Mercy Merrick had left her house. This is not quite correct. Julian, as you will presently see, has enough to answer for without being held responsible for errors of judgment in which he has had no share. Lady Janet (as she herself told me) went to the Refuge of her own free-will to ask Mercy Merrick's pardon for the language which she had used on the previous day. 'I passed a night of such misery as no words can describe'—this, I assure you, is what her ladyship really said to me—'thinking over what my vile pride and selfishness and obstinacy had made me say and do. I would have gone down on my knees to beg her pardon if she would have let me. My first happy moment was when I won her consent to come and visit me sometimes at Mablethorpe House.'

"You will, I am sure, agree with me that such extravagance as this is to be pitied rather than blamed. How sad to see the decay of the faculties with advancing age! It is a matter of grave anxiety to consider how much longer poor Lady Janet can be trusted to manage her own affairs. I shall take an opportunity of touching on the matter delicately when I next see her lawyer.

"I am straying from my subject. And—is it not strange?—I am writing to you as confidentially as if we were old friends.

"To return to Julian Gray. Innocent of instigating his aunt's first visit to the Refuge, he is guilty of having induced her to go there for the second time the day after I had dispatched my last letter to you. Lady Janet's object on this occasion was neither more nor less than to plead her nephew's cause as humble suitor for the hand of Mercy Merrick. Imagine the descendant of one of the oldest families in England inviting an adventuress in a Refuge to honor a clergyman of the Church of England by becoming his wife! In what times do we live! My dear mother shed tears of shame when she heard of it. How you would love and admire my mother!

"I dined at Mablethorpe House by previous appointment on the day when Lady Janet returned from her degrading errand.

"'Well?' I said, waiting, of course, until the servant was out of the room.

"'Well,' Lady Janet answered, 'Julian was quite right.'

"'Quite right in what?'

"'In saying that the earth holds no nobler woman than Mercy Merrick.'

"'Has she refused him again?'

"'She has refused him again.'

"'Thank God!' I felt it fervently, and I said it fervently. Lady Janet laid down her knife and fork, and fixed one of her fierce looks on me.

"'It may not be your fault, Horace,' she said, 'if your nature is incapable of comprehending what is great and generous in other natures higher than yours. But the least you can do is to distrust your own capacity of appreciation. For the future keep your opinions (on questions which you don't understand) modestly to yourself. I have a tenderness for you for your father's sake; and I take the most favorable view of your conduct toward Mercy Merrick. I humanely consider it the conduct of a fool.' (Her own words, Miss Roseberry. I assure you once more, her own words.) 'But don't trespass too far on my indulgence—don't insinuate again that a woman who is good enough (if she died this night) to go to heaven, is *not* good enough to be my nephew's wife.'

"I expressed to you my conviction a little way back that it was doubtful whether poor Lady Janet would be much longer competent to manage her own affairs. Perhaps you thought me hasty then? What do you think now?

"It was, of course, useless to reply seriously to the extraordinary reprimand that I had received. Besides, I was really shocked by a decay of principle which proceeded but too plainly from decay of the mental powers. I made a soothing and respectful reply, and I was favored in return with some account of what had really happened at the Refuge. My mother and my sisters were disgusted when I repeated the particulars to them. You will be disgusted too.

"The interesting penitent (expecting Lady Janet's visit) was, of course, discovered in a touching domestic position! She had a foundling baby asleep on her lap; and she was teaching the alphabet to an ugly little vagabond girl whose acquaintance she had first made in the street. Just the sort of artful *tableau vivant* to impose on an old lady —was it not?

"You will understand what followed, when Lady Janet opened her matrimonial negotiation. Having perfected herself in her part, Mercy Merrick, to do her justice, was not the woman to play it badly. The most magnanimous sentiments flowed from her lips. She declared that her future life was devoted to acts of charity, typified, of course, by the foundling infant and the ugly little girl. However she might personally suffer, whatever might be the sacrifice of her own feelings—observe how artfully this was put, to insinuate that she was herself in love with him!—she could not accept from Mr. Julian Gray an honor of which she was unworthy.

Her gratitude to him and her interest in him alike forbade her to compromise his brilliant future by consenting to a marriage which would degrade him in the estimation of all his friends. She thanked him (with tears); she thanked Lady Janet (with more tears); but she dare not, in the interests of *his* honor and *his* happiness, accept the hand that he offered to her. God bless and comfort him; and God help her to bear with her hard lot!

"The object of this contemptible comedy is plain enough to my mind. She is simply holding off (Julian, as you know, is a poor man) until the influence of Lady Janet's persuasion is backed by the opening of Lady Janet's purse. In one word—Settlements! But for the profanity of the woman's language, and the really lamentable credulity of the poor old lady, the whole thing would make a fit subject for a burlesque.

"But the saddest part of the story is still to come.

"In due course of time the lady's decision was communicated to Julian Gray. He took leave of his senses on the spot. Can you believe it?—he has resigned his curacy! At a time when the church is thronged every Sunday to hear him preach, this madman shuts the door and walks out of the pulpit. Even Lady Janet was not far enough gone in folly to abet him in this. She remonstrated, like the rest of his friends. Perfectly useless! He had but one answer to every thing they could say: 'My career is closed.' What stuff!

"You will ask, naturally enough, what this perverse man is going to do next. I don't scruple to say that he is bent on committing suicide. Pray do not be alarmed! There is no fear of the pistol, the rope, or the river. Julian is simply courting death—within the limits of the law.

"This is strong language, I know. You shall hear what the facts are, and judge for yourself.

"Having resigned his curacy, his next proceeding was to offer his services, as volunteer, to a new missionary enterprise on the West Coast of Africa. The persons at the head of the Mission proved, most fortunately, to have a proper sense of their duty. Expressing their conviction of the value of Julian's assistance in the most handsome terms, they made it nevertheless a condition of entertaining his proposal that he should submit to examination by a competent medical man. After some hesitation he consented to this. The doctor's report was conclusive. In Julian's present state of health the climate of West Africa would in all probability kill him in three months' time.

"Foiled in his first attempt, he addressed himself next to a London Mission. Here it was impossible to raise the question of climate; and here, I grieve to say, he has succeeded.

"He is now working—in other words, he is now deliberately risking his life—in the Mission to Green Anchor Fields. The district known by this name is situated in a remote part of London, near the Thames. It is notoriously infested by the most desperate and degraded set of wretches in the whole metropolitan population, and it is so thickly inhabited that it is hardly ever completely free from epidemic disease. In this horrible place, and among these dangerous people, Julian is now employing himself from morning to night. None of his old friends ever see him. Since he joined the Mission he has not even called on Lady Janet Roy.

"My pledge is redeemed—the facts are before you. Am I wrong in taking my gloomy view of the prospect? I can not forget that this unhappy man was once my friend; and I really see no hope for him in the future. Deliberately self-exposed to the violence of ruffians and the outbreak of disease, who is to extricate him from his shocking position? The one person who can do it is the person whose association with him would be his ruin—Mercy Merrick. Heaven only knows what disasters it may be my painful duty to communicate to you in my next letter!

"You are so kind as to ask me to tell you something about myself and my plans.

"I have very little to say on either head. After what I have suffered—my feelings trampled on, my confidence betrayed—I am as yet hardly capable of deciding what I shall do. Returning to my old profession—to the army—is out of the question, in these leveling days, when any obscure person who can pass an examination may call himself my brother officer, and may one day perhaps command me as my superior in rank. If I think of any career, it is the career of diplomacy. Birth and breeding have not quite disappeared as essential qualifications in *that* branch of the public service. But I have decided nothing as yet.

"My mother and sisters, in the event of your returning to England, desire me to say that it will afford them the greatest pleasure to make your acquaintance. Sympathizing with me, they do not forget what you too have suffered. A warm welcome awaits you when you pay your first visit at our house. Most truly yours,

"HORACE HOLMCROFT."

II.

From MISS GRACE ROSEBERRY *to* MR. HORACE HOLMCROFT.

"DEAR MR. HOLMCROFT,—I snatch a few moments from my other avocations to thank you for your most interesting and delightful letter. How well you describe, how accurately you judge! If Literature stood a little higher as a profession, I should almost advise you—but no! if you entered Litera-

ture, how could *you* associate with the people whom you would be likely to meet?

"Between ourselves, I always thought Mr. Julian Gray an overrated man. I will not say he has justified my opinion. I will only say I pity him. But, dear Mr. Holmcroft, how can you, with your sound judgment, place the sad alternatives now before him on the same level? To die in Green Anchor Fields, or to fall into the clutches of that vile wretch—is there any comparison between the two? Better a thousand times die at the post of duty than marry Mercy Merrick.

"As I have written the creature's name, I may add—so as to have all the sooner done with the subject—that I shall look with anxiety for your next letter. Do not suppose that I feel the smallest curiosity about this degraded and designing woman. My interest in her is purely religious. To persons of my devout turn of mind she is an awful warning. When I feel Satan near me—it will be *such* a means of grace to think of Mercy Merrick!

"Poor Lady Janet! I noticed those signs of mental decay to which you so feelingly allude at the last interview I had with her in Mablethorpe House. If you can find an opportunity, will you say that I wish her well, here and hereafter? and will you please add that I do not omit to remember her in my prayers?

"There is just a chance of my visiting England toward the close of the autumn. My fortunes have changed since I wrote last. I have been received as reader and companion by a lady who is the wife of one of our high judicial functionaries in this part of the world. I do not take much interest in *him;* he is what they call a 'self-made man.' His wife is charming. Besides being a person of highly intellectual tastes, she is greatly her husband's superior—as you will understand when I tell you that she is related to the Gommerys of Pommery; *not* the Pommerys of Gommery, who (as your knowledge of our old families will inform you) only claim kindred with the younger branch of that ancient race.

"In the elegant and improving companionship which I now enjoy I should feel quite happy but for one drawback. The climate of Canada is not favorable to my kind patroness, and her medical advisers recommend her to winter in London. In this event, I am to have the privilege of accompanying her. Is it necessary to add that my first visit will be paid at your house? I feel already united by sympathy to your mother and your sisters. There is a sort of freemasonry among gentlewomen, is there not? With best thanks and remembrances, and many delightful anticipations of your next letter, believe me, dear Mr. Holmcroft,

"Truly yours, GRACE ROSEBERRY."

III.

From MR. HORACE HOLMCROFT *to* MISS GRACE ROSEBERRY.

"MY DEAR MISS ROSEBERRY,—Pray excuse my long silence. I have waited for mail after mail, in the hope of being able to send you some good news at last. It is useless to wait longer. My worst forebodings have been realized: my painful duty compels me to write a letter which will surprise and shock you.

"Let me describe events in their order as they happened. In this way I may hope to gradually prepare your mind for what is to come.

"About three weeks after I wrote to you last, Julian Gray paid the penalty of his headlong rashness. I do not mean that he suffered any actual violence at the hands of the people among whom he had cast his lot. On the contrary, he succeeded, incredible as it may appear, in producing a favorable impression on the ruffians about him. As I understand it, they began by respecting his courage in venturing among them alone; and they ended in discovering that he was really interested in promoting their welfare. It is to the other peril, indicated in my last letter, that he has fallen a victim—the peril of disease. Not long after he began his labors in the district, fever broke out. We only heard that Julian had been struck down by the epidemic when it was too late to remove him from the lodging that he occupied in the neighborhood. I made inquiries personally the moment the news reached us. The doctor in attendance refused to answer for his life.

"In this alarming state of things poor Lady Janet, impulsive and unreasonable as usual, insisted on leaving Mablethorpe House and taking up her residence near her nephew.

"Finding it impossible to persuade her of the folly of removing from home and its comforts at her age, I felt it my duty to accompany her. We found accommodation (such as it was) in a river-side inn, used by ship-captains and commercial travelers. I took it on myself to provide the best medical assistance, Lady Janet's insane prejudices against doctors impelling her to leave this important part of the arrangements entirely in my hands.

"It is needless to weary you by entering into details on the subject of Julian's illness.

"The fever pursued the ordinary course, and was characterized by the usual intervals of delirium and exhaustion succeeding each other. Subsequent events, which it is, unfortunately, necessary to relate to you, leave me no choice but to dwell (as briefly as possible) on the painful subject of the delirium. In other cases the wanderings of fever-strick-

en people present, I am told, a certain variety of range. In Julian's case they were limited to one topic. He talked incessantly of Mercy Merrick. His invariable petition to his medical attendants entreated them to send for her to nurse him. Day and night that one idea was in his mind, and that one name on his lips.

"The doctors naturally made inquiries as to this absent person. I was obliged (in confidence) to state the circumstances to them plainly.

"The eminent physician whom I had called in to superintend the treatment behaved admirably. Though he has risen from the lower order of the people, he has, strange to say, the instincts of a gentleman. He thoroughly understood our trying position, and felt all the importance of preventing such a person as Mercy Merrick from seizing the opportunity of intruding herself at the bedside. A soothing prescription (I have his own authority for saying it) was all that was required to meet the patient's case. The local doctor, on the other hand, a young man (and evidently a red-hot radical), proved to be obstinate, and, considering his position, insolent as well. 'I have nothing to do with the lady's character and with your opinion of it,' he said to me. 'I have only, to the best of my judgment, to point out to you the likeliest means of saving the patient's life. Our art is at the end of its resources. Send for Mercy Merrick, no matter who she is or what she is. There is just a chance — especially if she proves to be a sensible person and a good nurse—that he may astonish you all by recognizing her. In that case only, his recovery is probable. If you persist in disregarding his entreaties, if you let the delirium go on for four-and-twenty hours more, he is a dead man.'

"Lady Janet was, most unluckily, present when this impudent opinion was delivered at the bedside.

"Need I tell you the sequel? Called upon to choose between the course indicated by a physician who is making his five thousand a year, and who is certain of the next medical baronetcy, and the advice volunteered by an obscure general practitioner at the East End of London, who is not making his five hundred a year—need I stop to inform you of her ladyship's decision? You know her; and you will only too well understand that her next proceeding was to pay a third visit to the Refuge.

"Two hours later—I give you my word of honor I am not exaggerating—Mercy Merrick was established at Julian's bedside.

"The excuse, of course, was that it was her duty not to let any private scruples of her own stand in the way, when a medical authority had declared that she might save the patient's life. You will not be surprised to hear that I withdrew from the scene. The physician followed my example—after having written his soothing prescription, and having been grossly insulted by the local practitioner's refusal to make use of it. I went back in the doctor's carriage. He spoke most feelingly and properly. Without giving any positive opinion, I could see that he had abandoned all hope of Julian's recovery. 'We are in the hands of Providence, Mr. Holmcroft;' those were his last words as he set me down at my mother's door.

"I have hardly the heart to go on. If I studied my own wishes, I should feel inclined to stop here.

"Let me at least hasten to the end. In two or three days' time I received my first intelligence of the patient and his nurse. Lady Janet informed me that he had recognized her. When I heard this I felt prepared for what was to come. The next report announced that he was gaining strength, and the next that he was out of danger. Upon this Lady Janet returned to Mablethorpe House. I called there a week ago—and heard that he had been removed to the seaside. I called yesterday—and received the latest information from her ladyship's own lips. My pen almost refuses to write it. Mercy Merrick has consented to marry him!

"An Outrage on Society—that is how my mother and my sisters view it; that is how *you* will view it too. My mother has herself struck Julian's name off her invitation list. The servants have their orders, if he presumes to call: 'Not at home.'

"I am unhappily only too certain that I am correct in writing to you of this disgraceful marriage as of a settled thing. Lady Janet went the length of showing me the letters—one from Julian, the other from the woman herself. Fancy Mercy Merrick in correspondence with Lady Janet Roy! addressing her as 'My dear Lady Janet,' and signing, 'Yours affectionately!'

"I had not the patience to read either of the letters through. Julian's tone is the tone of a Socialist: in my opinion his bishop ought to be informed of it. As for *her*, she plays her part just as cleverly with her pen as she played it with her tongue. 'I can not disguise from myself that I am wrong in yielding.....Sad forebodings fill my mind when I think of the future.....I feel as if the first contemptuous look that is cast at my husband will destroy *my* happiness, though it may not disturb *him*.....As long as I was parted from him I could control my own weakness, I could accept my hard lot. But how can I resist him after having watched for weeks at his bedside; after having seen his first smile, and heard his first grateful words to me while I was slowly helping him back to life?'

"There is the tone which she takes through four closely written pages of nauseous humil-

ity and clap-trap sentiment! It is enough to make one despise women. Thank God, there is the contrast at hand to remind me of what is due to the better few among the sex. I feel that my mother and my sisters are doubly precious to me now. May I add, on the side of consolation, that I prize with hardly inferior gratitude the privilege of corresponding with *you*?

"Farewell for the present. I am too rudely shaken in my most cherished convictions, I am too depressed and disheartened, to write more. All good wishes go with you, dear Miss Roseberry, until we meet.

"Most truly yours,

"HORACE HOLMCROFT."

IV.

Extracts from the DIARY *of* THE REVEREND JULIAN GRAY.

FIRST EXTRACT.

....."A month to-day since we were married! I have only one thing to say: I would cheerfully go through all that I have suffered to live this one month over again. I never knew what happiness was until now. And better still, I have persuaded Mercy that it is all her doing. I have scattered her misgivings to the winds; she is obliged to submit to evidence, and to own that she *can* make the happiness of my life.

"We go back to London to-morrow. She regrets leaving the tranquil retirement of this remote sea-side place — she dreads change. I care nothing for it. It is all one to me where I go, so long as my wife is with me."

SECOND EXTRACT.

"The first cloud has risen. I entered the room unexpectedly just now, and found her in tears.

"With considerable difficulty I persuaded her to tell me what had happened. Are there any limits to the mischief that can be done by the tongue of a foolish woman? The landlady at my lodgings is the woman, in this case. Having no decided plans for the future as yet, we returned (most unfortunately, as the event has proved) to the rooms in London which I inhabited in my bachelor days. They are still mine for six weeks to come, and Mercy was unwilling to let me incur the expense of taking her to a hotel. At breakfast this morning I rashly congratulated myself (in my wife's hearing) on finding that a much smaller collection than usual of letters and cards had accumulated in my absence. Breakfast over, I was obliged to go out. Painfully sensitive, poor thing, to any change in my experience of the little world around me which it is possible to connect with the event of my marriage, Mercy questioned the landlady, in my absence, about the diminished number of my visitors and my correspondents. The woman seized the opportunity of gossiping about me and my affairs, and my wife's quick perception drew the right conclusion unerringly. My marriage has decided certain wise heads of families on discontinuing their social relations with me. The facts, unfortunately, speak for themselves. People who in former years habitually called upon me and invited me—or who, in the event of my absence, habitually wrote to me at this season—have abstained with a remarkable unanimity from calling, inviting, or writing now.

"It would have been sheer waste of time —to say nothing of its also implying a want of confidence in my wife—if I had attempted to set things right by disputing Mercy's conclusion. I could only satisfy her that not so much as the shadow of disappointment or mortification rested on *my* mind. In this way I have, to some extent, succeeded in composing my poor darling. But the wound has been inflicted, and the wound is felt. There is no disguising *that* result. I must face it boldly.

"Trifling as this incident is in my estimation, it has decided me on one point already. In shaping my future course I am now resolved to act on my own convictions—in preference to taking the well-meant advice of such friends as are still left to me.

"All my little success in life has been gained in the pulpit. I am what is termed a popular preacher—but I have never, in my secret self, felt any exultation in my own notoriety, or any extraordinary respect for the means by which it has been won. In the first place, I have a very low idea of the importance of oratory as an intellectual accomplishment. There is no other art in which the conditions of success are so easy of attainment; there is no other art in the practice of which so much that is purely superficial passes itself off habitually for something that claims to be profound. Then, again, how poor it is in the results which it achieves! Take my own case. How often (for example) have I thundered with all my heart and soul against the wicked extravagance of dress among women—against their filthy false hair, and their nauseous powders and paints! How often (to take another example) have I denounced the mercenary and material spirit of the age—the habitual corruptions and dishonesties of commerce, in high places and in low! What good have I done? I have delighted the very people whom it was my object to rebuke. 'What a charming sermon!' 'More eloquent than ever!' 'I used to dread the sermon at the other church—do you know, I quite look forward to it now.' That is the effect I produce on Sunday. On Monday the women are off to the milliners to spend more money than ever; the City men are off to business to make more money than ever

—while my grocer, loud in my praises in his Sunday coat, turns up his week-day sleeves and adulterates his favorite preacher's sugar as cheerfully as usual!

"I have often, in past years, felt the objections to pursuing my career which are here indicated. They were bitterly present to my mind when I resigned my curacy, and they strongly influence me now.

"I am weary of my cheaply won success in the pulpit. I am weary of society as I find it in my time. I felt some respect for myself, and some heart and hope in my work, among the miserable wretches in Green Anchor Fields. But I can not, and must not, return among them: I have no right, *now*, to trifle with my health and my life. I must go back to my preaching, or I must leave England. Among a primitive people, away from the cities—in the far and fertile West of the great American continent—I might live happily with my wife, and do good among my neighbors, secure of providing for our wants out of the modest little income which is almost useless to me here. In the life which I thus picture to myself I see love, peace, health, and duties and occupations that are worthy of a Christian man. What prospect is before me if I take the advice of my friends and stay here? Work of which I am weary, because I have long since ceased to respect it; petty malice that strikes at me through my wife, and mortifies and humiliates her, turn where she may. If I had only myself to think of, I might defy the worst that malice can do. But I have Mercy to think of—Mercy, whom I love better than my own life! Women live, poor things, in the opinions of others. I have had one warning already of what my wife is likely to suffer at the hands of my 'friends'—Heaven forgive me for misusing the word! Shall I deliberately expose her to fresh mortifications?—and this for the sake of returning to a career the rewards of which I no longer prize? No! We will both be happy—we will both be free! God is merciful, Nature is kind, Love is true, in the New World as well as the Old. To the New World we will go!"

THIRD EXTRACT.

"I hardly know whether I have done right or wrong. I mentioned yesterday to Lady Janet the cold reception of me on my return to London, and the painful sense of it felt by my wife.

"My aunt looks at the matter from her own peculiar point of view, and makes light of it accordingly. 'You never did, and never will, understand Society, Julian,' said her ladyship. 'These poor stupid people simply don't know what to do. They are waiting to be told by a person of distinction whether they are, or are not, to recognize your marriage. In plain English, they are waiting to be led by Me. Consider it done. I will lead them.'

"I thought my aunt was joking. The event of to-day has shown me that she is terribly in earnest. Lady Janet has issued invitations for one of her grand balls at Mablethorpe House; and she has caused the report to be circulated every where that the object of the festival is 'to celebrate the marriage of Mr. and Mrs. Julian Gray!'

"I at first refused to be present. To my amazement, however, Mercy sides with my aunt. She reminds me of all that we both owe to Lady Janet; and she has persuaded me to alter my mind. We are to go to the ball—at my wife's express request!

"The meaning of this, as I interpret it, is that my poor love is still pursued in secret by the dread that my marriage has injured me in the general estimation. She will suffer any thing, risk any thing, believe any thing, to be freed from that one haunting doubt. Lady Janet predicts a social triumph; and my wife's despair—not my wife's conviction—accepts the prophecy. As for me, I am prepared for the result. It will end in our going to the New World, and trying Society in its infancy, among the forests and the plains. I shall quietly prepare for our departure, and own what I have done at the right time—that is to say, when the ball is over."

FOURTH EXTRACT.

"I have met with the man for my purpose—an old college friend of mine, now partner in a firm of ship-owners, largely concerned in emigration.

"One of their vessels sails for America, from the port of London, in a fortnight, touching at Plymouth. By a fortunate coincidence, Lady Janet's ball takes place in a fortnight. I see my way.

"Helped by the kindness of my friend, I have arranged to have a cabin kept in reserve, on payment of a small deposit. If the ball ends (as I believe it will) in new mortifications for Mercy—do what they may, I defy them to mortify *me*—I have only to say the word by telegraph, and we shall catch the ship at Plymouth.

"I know the effect it will have when I break the news to her, but I am prepared with my remedy. The pages of my diary, written in past years, will show plainly enough that it is not *she* who is driving me away from England. She will see the longing in me for other work and other scenes expressing itself over and over again long before the time when we first met."

FIFTH EXTRACT.

"Mercy's ball dress—a present from kind Lady Janet—is finished. I was allowed to see the first trial, or preliminary rehearsal, of this work of art. I don't in the least un-

derstand the merits of silk and lace; but one thing I know—my wife will be the most beautiful woman at the ball.

"The same day I called on Lady Janet to thank her, and encountered a new revelation of the wayward and original character of my dear old aunt.

"She was on the point of tearing up a letter when I went into her room. Seeing me, she suspended her purpose and handed me the letter. It was in Mercy's handwriting. Lady Janet pointed to a passage on the last page. 'Tell your wife, with my love,' she said, 'that I am the most obstinate woman of the two. I positively refuse to read her, as I positively refuse to listen to her, whenever she attempts to return to that one subject. Now give me the letter back.' I gave it back, and saw it torn up before my face. The 'one subject' prohibited to Mercy as sternly as ever is still the subject of the personation of Grace Roseberry! Nothing could have been more naturally introduced, or more delicately managed, than my wife's brief reference to the subject. No matter. The reading of the first line was enough. Lady Janet shut her eyes and destroyed the letter—Lady Janet is determined to live and die absolutely ignorant of the true story of 'Mercy Merrick.' What unanswerable riddles we are! Is it wonderful if we perpetually fail to understand one another?"

SIXTH EXTRACT.

"The morning after the ball.

"It is done and over. Society has beaten Lady Janet. I have neither patience nor time to write at length of it. We leave for Plymouth by the afternoon express.

"We were rather late in arriving at the ball. The magnificent rooms were filling fast. Walking through them with my wife, she drew my attention to a circumstance which I had not noticed at the time. 'Julian,' she said, 'look round among the ladies, and tell me if you see any thing strange.' As I looked round the band began playing a waltz. I observed that a few people only passed by us to the dancing-room. I noticed next that of those few fewer still were young. At last it burst upon me. With certain exceptions (so rare as to prove the rule), there were no young girls at Lady Janet's ball. I took Mercy at once back to the reception-room. Lady Janet's face showed that she too was aware of what had happened. The guests were still arriving. We received the men and their wives, the men and their mothers, the men and their grandmothers—but, in place of their unmarried daughters, elaborate excuses, offered with a shameless politeness wonderful to see. Yes! This was how the matrons in high life had got over the difficulty of meeting Mrs. Julian Gray at Lady Janet's house.

"Let me do strict justice to every one. The ladies who *were* present showed the needful respect for their hostess. They did their duty—no, overdid it, is perhaps the better phrase.

"I really had no adequate idea of the coarseness and rudeness which have filtered their way through society in these later times until I saw the reception accorded to my wife. The days of prudery and prejudice are days gone by. Excessive amiability and excessive liberality are the two favorite assumptions of the modern generation. To see the women expressing their liberal forgetfulness of my wife's misfortunes, and the men their amiable anxiety to encourage her husband; to hear the same set phrases repeated in every room—'So charmed to make your acquaintance, Mrs. Gray; so *much* obliged to dear Lady Janet for giving us this opportunity!—Julian, old man, what a beautiful creature! I envy you; upon my honor, I envy you!'—to receive this sort of welcome, emphasized by obtrusive hand-shakings, sometimes actually by downright kissings of my wife, and then to look round and see that not one in thirty of these very people had brought their unmarried daughters to the ball, was, I honestly believe, to see civilized human nature in its basest conceivable aspect. The New World may have its disappointments in store for us, but it can not possibly show us any spectacle so abject as the spectacle which we witnessed last night at my aunt's ball.

"Lady Janet marked her sense of the proceeding adopted by her guests by leaving them to themselves. Her guests remained and supped heartily notwithstanding. They all knew by experience that there were no stale dishes and no cheap wines at Mablethorpe House. They drank to the end of the bottle, and they ate to the last truffle in the dish.

"Mercy and I had an interview with my aunt up stairs before we left. I felt it necessary to state plainly my resolution to leave England. The scene that followed was so painful that I can not prevail on myself to return to it in these pages. My wife is reconciled to our departure; and Lady Janet accompanies us as far as Plymouth—these are the results. No words can express my sense of relief now that it is all settled. The one sorrow I shall carry away with me from the shores of England will be the sorrow of parting with dear warm-hearted Lady Janet. At her age it is a parting for life.

"So closes my connection with my own country. While I have Mercy by my side I face the unknown future, certain of carrying my happiness with me, go where I may. We shall find five hundred adventurers like ourselves when we join the emigrant ship, for whom their native land has no occupa-

tion and no home. Gentlemen of the Statistical Department, add two more to the number of social failures produced by England in the year of our Lord eighteen hundred and seventy-one—Julian Gray and Mercy Merrick."

THE END.

EBB AND FLOW.

ALL at once there was sunshine in the house. It had been a dull and rather dismal dwelling before; the men and women in it attended to their own business; none greatly concerned themselves about their neighbors, but regretted their sorrow civilly, were pleased with their gladness politely, and cared nothing at all if they disappeared entirely. A humdrum house, where people came and went, and nothing happened; where we were all a sort of shadows; and the most silent and shadowy of us all was little Rosa Mayne—an insignificant little body at whom you never thought of looking twice; so fair and pale and small that she never seemed to be a real entity, and going on so quietly, with so few words and small stir, that you forgot to notice her existence, as though she were a mere part of the inanimate surroundings. If you had a funny thing to say, you never thought of glancing toward Rosa for a smile. If you told a pathetic story, it was not for the sake of the tear in Rosa's eye. And Rosa might be sick, or sad, or sour—she had it all to herself, for there was nobody who knew a word about it.

But, as I said, all at once there was sunshine in the dreary and dingy house, and the sunshine fell through Rosa. Flowers began to be blooming in the old vases; ivies began to decorate the parlor; wonderful things in canvas and worsted began to brighten it; old prints framed in home-made passe-partout began to adorn it; there was a tiny fernery established in the window there; pretty work was lying round; the old piano was open; and there was a pink bow at Rosa's throat, and a pink color on her cheek, and a sparkle in her eye, and she was tripping up and down in a gay bustling way, like one who has established a right to be in the world, and found it recognized, and her sweet little childish voice was caroling from room to room, and on every stair and landing. And we all of us wondered where in the world our eyes had been, and we all of us used them now, and we saw long black lashes and gray eyes, and a crowning twist of black hair; delicate features, a thin sweet mouth, and a skin transparent and white as lilies are, save for this fresh new color that was always rippling over it now. We could not call her pretty, but we wanted to look and look again; and just as we were all of us falling in love ourselves, the real cause of the metamorphosis came upon the scene, and we fell back and made salam to Rosa's lover.

By all of us, I mean the young gentlemen of the house—for my part I was a poor old maid in my fiftieth year, and of course it was little matter what I thought or did, being a piece of lumber that Time would have swept out of the way if he had known his business.

Little Rosa was our landlady's step-daughter—treated well enough by her step-mother, for all we ever saw; but the poor lady could afford her but few indulgences, and the young girl's life had passed in the shadow that bleached and blanched her, and kept her the unnoticed thing she had been. But now she was out in the sunshine—the sunshine of hope and joy: somebody came home with her from church; somebody took her out to concerts; somebody sat in the parlor with her in the evening, long after her mother was sleeping the sleep of the just; somebody met her unexpectedly as she went on her errands or took her strolls; to somebody she had become the very centre of the universe, and the sun rode in the meridian just above her head. All these other people, these boarders, who had never taken her to lecture or theatre, who had forgotten to say good-morning to her—she had changed rôles with them; it was they who were shadows!

But, nevertheless, she could afford them a little of her sunshine. A little! that sunshine just filled the house. She was a person of importance; her lover was a king among men; he thought her peerless among women. She knew better herself, but it was delightful to have him think so.

She went about now jingling the keys at her belt—she was learning housekeeping. Randolph was rich, but that made no matter; she could bring him nothing but herself: she meant that self should be perfect in all the accomplishments within reach, and she was sure nothing would give him more comfort than his wife's mastery of a thorough system of housekeeping. The poor little happy thing had no other accomplishment, except the strumming of a simple accompaniment to her simple songs. But apparently Randolph thought she needed nothing more, for he looked at her in a way that implied she was already all a woman should ever hope to be.

He was a handsome fellow, this Randolph Howe—one of those superb creatures that can take girls' hearts by storm through sheer force of their animal strength and beauty, if they have no other force; tall, well-made, dark-eyed, smooth-cheeked, and with masses of ebon black hair, with kind manner and bright wit, he seemed doubtless to the little pale Rosa like a being from another planet and of superior race.

Perhaps he was of superior race, though: at any rate, I fear he thought so. If he did not, his friends did, for the Howes were an

old family in the city that had always held their heads aloft, had always married rank and wealth, had never made a mésalliance; the refinement of generations ought to have told upon them if it did not; and if there is any such thing as progressing toward perfection in a greater ratio than that in which our fellow-mortals progress, the Howes, from their greater advantages, might be supposed to have done so. Of course, then, it might also be supposed that, having made so much progress, these people were able to see through the thin triviality of social distinctions to the solid basis of worth in a person. But nothing would have been farther from the truth. They did not believe much solid basis of worth really existed out of their own social circle; they thought it required generations of riches, of learning, of ease, of travel, of fine friends, fine tables, fine clothes, to make this solid basis of worth, save in those rare exceptions which might go to prove the rule—and of course Rosa Mayne, the daughter of a poor boarding-house keeper, was not one of those exceptions; and when they heard in what direction Randolph was drifting, they quietly ignored the facts, and waited for Randolph to return to his own place.

But Randolph had no idea of returning at present. Perhaps he was weary of the aimless and dilettante life; of the languid and elegant ladies; of the girls a little blasé, and with a certain affectation of musical, or theatrical, or scientific slang. There seemed to him something so new, so fresh and innocent, in this little Rosa of his, that it recalled to him one scene in his life, when, leaving a heated ball-room, where the muslin blossoms still bloomed gaudily round the chandeliers, and the exotics on the breasts of the dancing women were fallen and faded, he had stolen into a garden, where the morning-star was just mirroring itself in the bosom of a dew-drop shining on a half-blown rose. Perhaps the haughty Howes would find their senses in time; meanwhile he was very sure he had not lost his. And as he was his own master, and master of a tolerably good inheritance, he did not feel it necessary for him to sue his mother and sisters for consent that would never be given, and it was his intention now to marry out of hand. If he was not so rich as he might be, he could still have city home and country-house, horses and dogs; Rosa could keep her carriage, and he would have the little flock of half brothers and sisters educated and started in life in such wise that they need never be ashamed to own them. As for Rosa herself, she had been quite well educated in the essential things before her father's death had changed their manner of life, and she had that innate and delicate grace which supplied all lack, and always would, he said.

But rich or poor, Rosa would have none of his possessions as yet. She would not receive one of the costly gifts he longed to give. The thought of it made her dear cheeks burn; she could hardly have told you why—whether it was like spreading a price before her, or whether it was a sort of accentuation of the difference in their stations. She made him take back the watch, which was only a bunch of gems. When he brought her diamonds and great pearls to choose from, she closed both the cases and pushed them away.

"What do you mean?" he said. "These are the things my wife will wear!"

"Well, when you have a wife," she answered, shyly and half saucily, "it will be time enough."

"When I do, I will cover her with jewels, the proud little wretch!" he said, and covered the sweet mouth with kisses then.

The only thing she would consent to have was her engagement-ring, and as he had liberty to choose there, he betrothed her with a great clear stone that glittered on her finger like a tear. But Rosa always seemed to feel that the sparkle of that diamond was a tell-tale blazon of her joy, and wore the stone turned in!

But how happy she was! I used to watch her sometimes through the glass door of the extension-room, as I sat there with her mother, trying vainly to thread a needle with my spectacles, my eyes being turned the other way. I recalled the time when I was young and happy too. I remember one night when, the lights burning low in the front parlors, Rosa sat with her fingers lightly running over the keys in the accompaniment to one of her half dozen little songs, while Randolph stood leaning on the piano, his hat in his hand, saying he must go. As he stood there, Rosa looked up at him and began to sing:

"My heart is a fount welling upward forever,
When I think of my true-love, by night or by day;
That heart keeps its faith like a fast-flowing river,
Which gushes forever and sings on its way.
I have thoughts full of peace for his soul to repose in,
Were I but his own wife, to win and to woo—
Oh, sweet, if the night of misfortune were closing,
To rise like the morning-star, darling, for you!"

And then Randolph kissed her lips, and he looked at her a moment silently with those dark and glowing eyes of his, and kissed her again, and was gone, and we heard his swift steps ringing on the flags. And that was the last kiss he gave her; for into that house he never came again.

I remember how she went about after he had gone, setting things to rights, putting the chairs in place, folding the work she had thrown down, closing the piano, arranging the music in order, with such a dancing step, with such a light of contentment on her

face. Some page of the music had caught her eye, and she was absently humming its burden to herself:

"For my love is dead,
Gone to his death-bed,
All under the willow-tree."

And then she caught herself singing such fatal words, and shivered and laughed, and went to the glass to pluck away the flower he had hung in her hair, and took it and kissed it again, and sat down on the little ottoman there, her face on her knees, sobbing, and crying to herself, "Oh, I am so happy! so happy!"

As for me, I was not always a poor old maid in a boarding-house. Once I was eighteen, and gay, and with good expectations myself; and then I had friends, and they were among such people as these Howes—and some of them were the Howes—the aunts and uncles of Randolph himself. If they were not friends now, they still were acquaintances; and though I said nothing about it at home, where Rosa's sensitive ears might suffer, I had heard all the gossip in the circle of the Howes concerning Randolph's last flame, as they called it. They called it so to make light of it—indeed, it was no joking matter: Randolph in reality had never been known to have a flame before.

Of course his four supercilious sisters and their mamma had curved their contumelious lips, and been exceedingly disgusted over the whole affair. "The idea," they said, "of Randolph, after all his career, his birth and education, his life abroad, being fascinated by the face of a little girl standing in a church porch and waiting for a shower to pass, and offering her the shelter of his umbrella, and following her up till he found some one to present him, and then absolutely succumbing to her vulgar wiles! Fresh and innocent! As if there were no girls in his own set that were fresh and innocent! She was an artful minx—nothing but artifice could have captured Randolph, with all his experience! And if he did not recover himself before Hortensia Brooks came, they should be in despair;" and so it ran on.

Well, the night that Rosa sang the little song which I repeated to you, Hortensia came. And when he went home he found her there. Perhaps he was tired, perhaps he was ill, perhaps he was magnetized—but he stood there, dumb and dazzled.

And you would not wonder if you had seen Hortensia as she was then—the largest, most luxuriant type of womanhood, superb and regal; flesh moulded every where into perfect curves; a fruity bloom on the cheek, a melting redness of the lip; features fit for marble, brown eyes that seemed to burn; a smile that harmonized the face like sunlight, and made conquest of you at once; hair that crowned the whole in braided gold, and a laugh that rippled like a passage of sweetest music whose thread you had hardly caught. She was something not to be seen twice in a lifetime; her beauty was of the sort that is given to one person out of a whole generation; old men took off their hats in the street when she passed along. To beauty was added another gift—she sang like a siren, and her wealth was almost fabulous.

She was singing when Randolph stood in the door—ah! how differently, he might well have thought, from the thin, faint tones of little Rosa's voice, just heard: rich, full, powerful music that delighted the inmost sense. She sang for him till after midnight. The next day he rode with her—his mother and sisters demanded that attention to their guest. The next day they had no need of demanding it.

Perhaps he was proud to be seen the esquire of such a dame; perhaps the sumptuous beauty stimulated his somewhat jaded sense; perhaps his sybaritic soul reveled in the pleasure of such neighborhood, the touch of such a hand, the sound of such a voice. The first he knew of it all was when, one day, having been lapped in this Elysium a week, as she swept by her gown brushed his arm, and sent a shiver thrilling him from head to foot. Then he was in a dream, beneath a spell; he forgot all about the little white colorless creature to whom he had once made such sacred vows: that pale flame burned unseen against the great blaze of red sunshine here. He hardly left Hortensia's side; all the animal delight in luxury and passion within him rose and swept him forward. He had intellect enough unblinded to direct it in the way he would, to become a power before her and above her, to fasten her thought and fancy as she had fastened his, to make himself the master. And two months from the time when he went home and found her singing that luscious Italian song he married Hortensia.

In all those weeks he never came near Rosa. If he ever thought of her, he may have felt a throb of pity, but he could not, would not, pause or turn. The timid note she sent him, when she feared lest he were ill, was tossed aside unopened. Indeed, I think that, for the time being, he was just and simply mad. At last, when I saw my little Rosa's wonder pass into dismay, when I saw her eyes heavy in the morning with the night's weeping, her lips contracted in silent pain, and the pain growing into an agony, I thought it best to tell her what I knew.

She had become very white and shadowy again, but she turned on me almost fiercely in her unbelief.

"They are going to the theatre to-night," said I. "You shall come with me, and see them for yourself."

I could not very well afford the thing, but

I thought it best for her; and so we sent for tickets, and had a carriage, and went.

I am sure I forgot what the play was; nor do I believe that Rosa saw any thing in all the bright scene save the two faces of which we occasionally caught a glimpse, half shrouded as they were behind the draperies of the box. But we stood in the lobby while our hack was coming up, and we waited there for them as they came out. They came with the crowd, and paused close beside us; he lifted his hands to draw the white fur, with its rose velvet linings, closer about her—a common action enough, but it was no common look on his face that accompanied it, as he bent his head to hear her murmured word; it was a look impassioned and intense, a look of longing and adoring and of rapture. No place, indeed, for such a look, but Randolph was in the mood that regards neither time nor place. Rosa clasped my arm and held it like a vise; her weight was heavy on it; and so they passed on, with eyes only for each other, proud, rich, beautiful, satisfied; and when they had gone I beckoned an assistant, and he carried my fainting Rosa for me to the carriage, and there I tore her veil off, and we drove home. "Put him out of your heart, dear," I said. "He never deserved a place in such a shrine. And don't delude yourself with the idea that he is being sacrificed in marrying that woman; she is good enough for him. Nor with the hope that he can not marry her without first coming to you; he has forgotten that you exist." And after that the little thing went about her duties, whiter and thinner every day, but always busy, with a feverish desire to forget herself; and we saw no tears, and we heard no sighs—only I knew that, young as she was, the lovely world and happy life had lost their hold, and she would sooner die than live.

Well, well, that wedding was a gorgeous pageant. Hortensia's own home was so far away, and the season so inclement, that it was judged best for her to be married where she was; and the affair was pushed on eagerly by Randolph, and she was nothing loath. The church was filled with women in splendid toilets and their escorts; the altar was a blaze of radiance, with tier on tier of burning wax-lights, whose lustre fell on the matted blossoms underneath—on the chancel rails wreathed with exotics, the steps strewn with roses and jasmines and lilies; the young acolytes in their white and purple robes swung golden censers; the organ rolled out its tumultuous melody; clusters of airily clad maidens floated up the aisle with officers in all the glancing of gold-lace and plumes—for Randolph had been a West Point man himself, and his friends were round him now. The bride came in alone, with blooming little children holding up the wonderful work of her satin train; the groom waited for her at the altar; the lace-wrapped priest met them. And when they turned about and faced us and stepped down, I think many hearts must have beat more quickly at the sight of such majesty and splendor, such beauty and passion, as they embodied. But Rosa was not there—surely she could hardly have looked on such a scene and lived.

A glorious pageant; but it had its reverse. The family coach of the Howes, reserved for the bride, had met with an accident just before coming to the church, and it had been necessary to replace it by an additional one from the livery—a new and handsome clarence; but its last occupant had been an infected person, who, if he were conscious of what he did, had committed murder in using it. On her bridal journey the bride drooped and sickened; a fortnight from that night of splendid revelry her illness was declared—a week of wild delirium, and her body, the flesh falling from it, was rolled in a tarred sheet and carried in the rude small-pox hearse at midnight to its grave.

As for Randolph, I don't know what became of him then. There were all sorts of rumors—rumors of insanity, rumors of riotous dissipation, rumors of a wandering life in the blackest gloom. He might well have been crazed, plunging from such warmth and bliss into such ice-cold night and despair. He might well have been whirled off into any sin, seeing all the glory of that rosy flesh change as instantly to loathsomeness and corruption as if the ground had failed beneath his feet; seeing the nothingness of things of earth, unable yet to comprehend the things beyond. Only one rumor out of the whole was a certain truth—he did not come back. His mother and sisters might console themselves with their work; with the recollection of their pageant; with the understanding that Hortensia's great fortune was now in their own family; with the knowledge that there was one man in the world who, when age came to him, would have no hearth to warm him by, no child, no wife; at any rate they did not have Randolph to console themselves with. Whether it ever occurred to him or not that it was to them in any degree that he owed his misery—that they had brought the splendid temptress to him, and so insnared him that the quiet home, the gentle wife, the peaceful life he had been promising himself had become impossible before the intoxication with which they had allured him—I can not say. Truly, whatever the fault in their case may have been, he had nobody but himself, his own senses, his own weakness, to blame. He might remember Hortensia now as some dark star remembers the flash and glory of a comet's vaporous lustre that once wrapped it and passed away, some star that at its inmost centre still feels the drawing of the

sun. It was seven years before any one here saw Randolph Howe again, and then he came home a white-haired man—white-haired, but his dark eyebrows still cast their shadow over his dark eyes, and the dark mustache seemed darker by the cheek brown with the touch of the suns of Southern seas.

These seven years had brought their changes to others too. They changed me from a middle-aged woman to an old one—a garrulous old one, you see. They changed the frequenters of our house to others. And they changed Rosa from the little stepdaughter to the mistress of the house; for her step-mother had died, after long pain and illness, and had left her burden of care and children for Rosa's shoulders to bear.

Well, it is wonderful to see sometimes how much the most fragile can endure. Rosa could hardly have looked more delicate now than she used to do, but she had refined away to something almost spiritual. The happy rippling laugh was gone, indeed: no one ever heard her laugh, but no one ever saw her cry; a gentle smile played about her face like a reflected light—the smile that comes from trying to make others happy. She had filled her step-mother's place better than it had ever been filled before; had prospered so as to warrant her taking a better house, and that house was kept to a marvel, not like a boarding-house, but like a home. Her little sisters she had sent away to school; for the oldest boy she had secured a place in a bank, and the two younger boys she kept at home. She had, moreover, found some time to read, to visit a few poorer people, and she never closed her piano. Her old boarders came back to visit her, her new boarders thought they had fallen upon Paradise; she had forgotten herself in doing for the rest—hardly more than twenty-five, she seemed to have the experience, the tact, the wisdom of twice as many years.

And of course we have been a happy family—we are a happy family. I wonder if it is all to be broken up because this man has come back!

For four months ago a person was thrown from his carriage upon the pavement opposite; and of course Rosa's doors flew open wide, and he was brought in and carried into the little private parlor that ran behind the others, and laid upon a lounge there, and the doctor was called. And as she looked at the half-unconscious man's face, which his position had hindered her from seeing before, Rosa's own face blanched; and as he opened his eyes he might have taken her for the reproachful ghost of the youth that he had wrecked. But he held his arms toward her with an imploring gesture, crying out her name, and then he fainted dead away.

When the doctor came he forbade the patient to be moved: it was a compound fracture, and a bad wound, and the wound must heal before the bone could knit; so a cot was brought down into the little private parlor, and his servant was sent for, and Rosa came into the room no more—only I, as an old woman, went and came as I would. And his mother and sisters, as soon as he could see them, called, one or the other of them, upon him every day, for they really loved him in their fashion. It would have been a hard heart that could have helped loving him, with his attractive ways: it was because we loved him so that things had been so bitter. I remember poor Mrs. Mayne, one day long before she fell ill and died, sitting down for a hearty cry to think he had disappointed her so.

At last—let me see, that was a month ago—Randolph sent for Rosa.

It was in the twilight. I was sitting in the front parlor by the grate, nodding, half in a dream, when she came in and glided through. The doors between the rooms were all wide open, it had been so warm when he lay dressed upon the lounge; and he had sent his attendant away.

"Did you ask for me?" she said. And her voice was clear and sweet as a bell, but she spoke in a tone as if she had never seen the man before.

He made her no reply. Only he was looking at her, I could see—for I was not nodding any longer—while she stood there with the glow of the fire-light upon her.

"Did you send for me?" she said again.

"Rosa! Rosa!" he cried, suddenly, and stretched his arms toward her again, as he did the day he was brought in. But she floated back like thistle-down before a breath. And at that he turned and buried his face in the cushion, and shook it with sobs. And, of course, that brought her round, as perhaps he knew it would—a woman can not bear to see a man cry; it seems to her then as if there were something wrong with the universe. She put her little cool hand on his where they were flung clasped above his head. "You have no need," I could just hear her murmur. "I forgave you long ago."

Presently he was still again. "Do not take it away," he said. "So cool, so pure! Oh, down there, on the other side of the world, I longed for the touch of it—longed for the cool touch of it when I was in a burning hell! Do not think I am ever going to make love to you again!" he exclaimed, half rising on his two elbows and confronting her. "I should as soon think of making love to one of God's saints! But I was in a delirium."

"Hush! hush!" she said.

Then she sat down on a low chair beside the lounge, and he lay and looked at her.

And do you suppose he didn't make love to her, then and there and on the spot?

Oh yes, then, and at all other times. He hardly let her out of his sight; he sent for her almost hourly; he pursued her with his plea, and he called in all aids of pathos and pity. For a time she would not understand him, and then once I heard her answer, as she sprang away from the arm that had stolen round her unawares. "For what do you take me?" she cried, passionately. "Once you tossed me by like a faded flower! You tossed me down and trod on me! If you had trodden on a rose so, would there be much sweetness left? And do you think you did not tread all love out of my heart?"

"Rosa!"

"And can you believe that I have no more spirit—that I am so base as to endure the same—"

"But you said that you forgave me!" he answered her.

"And so I do."

"That is not the way Heaven forgives sinners!"

"I am not Heaven—I am an outraged woman!"

"And do *you* think I do not remember that?" he cried. "Do you imagine I ever forgot your suffering, your pain, after I once awoke? Do you imagine that it has been all selfish longing that has tortured me in these infernal years, and never once the desire to comfort you, the sense of your misery and loneliness? Do you imagine I would not rather have died, when I came to myself, than know that I had caused you all that? For I knew, I know, you suffered! Oh, Rosa, my little, poor white thing, forgive me, and let me atone for it! Oh, my love, come to me, come to me, be my own again!" But Rosa's hands were folded in her lap, and she did not stir.

And then Mr. Randolph took desperate measures; he sent for his mother and sisters to aid him; he threatened to tear his wound open; he even enlisted me. And the proud dame and her proud damsels had to stoop, had to come and beg my little pale Rosa to have mercy upon their son and brother, had to court her and invite her, and embrace her and make much of her!

"I suppose it will have to be," Miss Juliet said to Miss Abigail yesterday, as they waited for their carriage, and quite oblivious of me. "But how such an insignificant and commonplace body ever infatuated our Randolph so—"

I spoke right up. "Commonplace she may be to strangers as Rosa Mayne," I said, "but give her her fur-lined silks and cachemires, and ostrich plumes, and her husband's name and house and equipage, and you will all be wondering that you never saw the beauty of that spiritual Mrs. Randolph Howe!" I said.

They both turned and stared. And then Miss Abigail suddenly stooped and kissed me. "Well, you are a good little thing," she said. "And I hope it will all be for the best."

I know it will all be for the best! But if she does marry Randolph at last, what in the world do you suppose is going to become of me?

Editor's Easy Chair.

THE sun has never kept himself so long out of the way among us as this last season, and yet the old proverb, "Out of sight, out of mind," has not held good in his case. He has never been so much talked about as since he has made himself so scarce. We have complained about him, and longed for him, and sentimentalized over him, and philosophized and moralized upon him as never before; and now that he is coming back to us, and the hundred days of sleighing are over, and the grass is green, and the buds are bursting, and the birds are singing, the Easy Chair* can not be indifferent to the fact, nor refuse to add its word upon the worth of sunshine.

This winter has marked one of the great dates in the history of the sun, and Europe has kept the four hundredth birthday of Copernicus with much heart and circumstance. The great astronomer's statue has been placed in the Roman Catholic Church of St. John, in Thorn, his birthplace. His epoch-making work, *De Revolutionibus*, has been magnificently printed by the Copernicus Union there, and freely distributed among the scholars of Christendom; a festival volume of his fugitive pieces and memoranda has been published at Braunsberg, near the place and in the diocese where he lived as a priest for the last thirty-three years of his life; a jubilee number of the Warsaw *Illustrated Times* has presented the chief memorials of his glory, and Prussia combined with Poland to add splendor and significance to the occasion. Eloquence, music, and the drama entered into the festivity; and one of the most expressive acts was the transition from the scene that presented the astronomer in his priest's garb on his death-bed, in 1543, receiving the first printed sheets of his great book on the solar system, to the grand triumphal display when the rising curtain presented upon the stage his statue, crowned with flowers, and honored by the homage of science and the gratitude of the nations.

It is impossible for any man to tell the number and greatness of the changes that have come over our modern thought and activity from the studies of Copernicus, and it certainly is not our business to undertake that task. It is easier to

look the pleasant sunshine in the face, and to chat a little about the play of his beams, and the power and blessing of his light and warmth. It is very evident that the new science has spread, and is spreading, great alarm among people of the old school, and that poets and men of letters, as well as theologians and devotees, have been reached by the scare. We often wonder that the Pope and the scholastics of his time were so scandalized by the doctrine of Copernicus, and that they thought that the Scriptures and the Church were brought to naught by the notion that the earth turned round the sun instead of the sun turning round the earth. But we find ourselves shrinking frequently from the results of his principles, and we can not bear to have our private interests and our personal prejudices made subject to the reign of law, and our own little piece of clay held subordinate to the universal order. Many who are not troubled about theological dogmas and ecclesiastical usages are much concerned for the elements of beauty, and the creations of poetry and the arts, in their fear that inexorable law may destroy all enthusiasm, and the abstractions of science may supplant the embodiments of fancy and the personations of love. It may be that much of our romantic and poetic literature has sprung from the reaction of the ideal sense against the threatening rule of materialism, and that Goethe and Scott, Wordsworth and Tennyson, and their fellows, have had much of their motive and their power from their mighty protest in behalf of the old ideal faith against the new naturalism. Tennyson's *In Memoriam* is perhaps as good a representative of this movement as any work of genius; and what is it but the cry of love and friendship against the fatality of law, and the affirmation of the rights of the heart and the life of the soul in view of the roll of planets, the play of atoms, and the sway of material forces? It is a cry out of the Golgotha which materialism makes of the universe for immortal life—a cry for God and his children in face of that vision of mouldering skulls and dissolving globes.

> "Who trusted God was Love indeed,
> And love Creation's final law,
> Though Nature, red in tooth and claw
> With ravin, shrieked against the creed."

There is certainly something in science that at first takes down our enthusiasm, and tells us how little our fancies amount to in view of the solid facts of nature, and how little our wishes are heeded in the movements of the universe. Thus, after reading the new views of the solar force, and learning that this light and heat come probably from fires that are fed by a perpetual supply of falling meteors, we find it hard to see the glorious Apollo in those terrible furnaces, or to make out any conception even of a being as little comely as old Vulcan in those abysses of destruction. In fact, some theorists deliberately say that the age of poetry and of the ideal arts has gone, and that the rise of science is the reign of simple fact, observation, and calculation. A tract has just come to hand from Berlin, of the date of 1873, which professes to contain the faith of a modern student of nature, which deliberately affirms that the higher intellectual faculties are those which are directed, according to mathematical and scientific and logical forms, toward positive facts, and which argue solely from these; while the lower functions of the brain produce all the dim, half or wholly unconscious ideas, such as bring dark intimations, mystical presentiments, aspirations, fancies, imaginations, and all poetical inspirations. According to him, all claims to poetical or theological revelations belong to the mental range of the "negroes and Bodokutes," and are wholly beneath the dignity of the human reason; and apparently by his standard Shakspeare's genius is less rational than Babbage's calculating machine, and Haydn's *Creation* is a lower work of art than the register of Father Secchi's astronomical clock. Yet this very man dreams and romances as wildly as any Congo magician when he soberly affirms that the world-space is not empty, but is filled in part with a fine material ether, and in part by world-dust, which bears the germs of plants and animals, kept cool in interstellar cold, all in readiness to clothe new globes with life.

The great masters of scientific thinking are themselves the practical refutation of the miserable prejudice that the scientific intelligence is incompatible with the ideal imagination, and every great discovery or invention has had the help of hypothesis as well as fact, and the light of imagination as well as logic. There is a certain scientific instinct which is as creative as poetical genius, and the chief thinkers of all ages, from Pythagoras to Copernicus, from Socrates and Plato to Kepler and Kant, have had it in connection with their faculty of abstraction. The best thoughts come intuitively to the scientist as to the moralist and the poet, and while the facts of nature may suggest them, it is only the open vision that can take the hint. It is a profound thought that Lichtenberg expresses when he says that "we should say *it thinks*, as we say *it lightens*." To say I think (*cogito*) is too much, if it means that it is we ourselves that do all the thinking. The mind, like the eye, has a sphere as well as a sense of its own.

There has certainly been an ideal element in all great discoverers, and the new science has brought, and is bringing, its forms of poetry and art. This festival volume of the Historical Union of Ermeland, for the late anniversary of Copernicus, contains seven Latin poems of his that are wholly new to us. They are in Horatian Latin verse, each containing seven stanzas, and are called so many stars, thus—Sidus I., Sidus II., etc. They all turn upon the birth of Christ, and show range of fancy and mastery of facts. But these are not the proof of his ideal genius, and his science of the heavens, in its severe geometry, is a grander poem than this Christmas Pleiades—these seven stars of devout song. That little folio of 217 leaves, in black-letter, with red initials, now preserved in its leather binding at Prague, is one of the great creations of genius as well as triumphs of calculation, and the rational mind which it has so educated is found constantly to bloom into beauty, and to embody the ideas of science in the creations of art.

We have had more than three hundred years of astronomy since Copernicus, and we are now closing a hundred years of chemistry since Priestley discovered oxygen, and Lavoisier completed the work and exploded phlogiston. These two sciences, that deal the one with the masses,

the other with the atoms of the universe, are at the foundation of our new thought and activity, and no one can tell what great things are yet to come from them. The sun holds the central place in them both, and the light which comes from his mighty mass is the most powerful force that acts upon the molecules around us and within us. Light and its affinities are the most attractive and significant study of our time, and we are looking into the face of the sun and trying to make him smile upon us and work for us as never before. The visit of Professor Tyndall to this country had its great interest from this fact, and our people went to hear him in such remarkable numbers because he was thought to know all that is known about light, and they wished to hear what he had to say.

If we are wise we shall live more in the light of day, and not only make hay, but do a great many other things while the sun shines. In all probability the sun is to help us in our business of education, nurture, and health as never before. Already he is becoming the great compositor, and setting, not types, but the images of all nature and life into form for the press. The heliotype is the most marvelous of types, and every thing in the heavens and on earth can now be printed from its fonts. The people of our time have been instructed and entertained mightily by the photograph, and we are now seeing new and wonderful applications of this power. The copy, indeed, is not the original, and the sun copies and does not create the images in the camera. In this respect the power of the photograph is limited, and it is material for art rather than art itself. Yet the sun has much to do with creating the scenery and the life of nature. There is no good coloring, no exquisite form, no graceful action, without his rays, and he is the greatest of painters and sculptors; and the landscape, the flowers, and the trees, the insects, birds, and beasts, and man, their master, are ready for the eye and hand of art only after the sunshine has stirred them into life and activity.

We are undoubtedly to learn anew to win thrift and health from out-door living and work, and gardening is to have more place among the refinements as well as the utilities. We have not only the old question, "How shall we get a living?" to meet, but we are to consider the peculiar tendencies of our time, and the danger of losing health and tranquillity by the intense excitement of city life, and the morbid delicacy of our temperament and nerves. Our sons and our daughters need the garden and the field, the orchard and the forest, or their years will be few and not cheerful. It is well that these pursuits are entering now into the methods of education in schools and in colleges, and for the rich as well as the poor. The present catalogue of Harvard University gives a list of fifteen professors and teachers in the Bussey School of Agriculture and Horticulture, and this institution is no exceptional marvel, but one of the signs of the times. There is no more pleasant and interesting proof of this movement than the Garden Industrial School at Weimar, the city so famous as the residence of Goethe, who won honors as a naturalist as well as a poet, and set forth some original views regarding the theory of color and the structure of plants.

The object of this school at Weimar is to instruct school-children from their eighth to their fourteenth year, in their hours out of school, in gardening and in kindred industry, and also to fit young men who have left school for practical gardening, an employment which is in great demand in that country. This school was established in 1853, partly from the proceeds of charitable meetings, and partly from church offerings. A piece of land was purchased near the city, and devoted to this purpose, under the charge of a board of administration, with a director at the head. Three members of the board control the departments of trees, vegetables, and flowers; another member has charge of the accounts and the funds; and one has supervision of the property and of the sale of the productions. The director and the committee serve without salary, and with no return except for actual expenses. At the head of the practical working of the institution there is a superintendent who is both skilled in all garden industry and in the art of teaching. He has a salary, a house free, and a share of the profits of the garden. Under him there are three master-gardeners or overseers, who have severally charge of the nurseries, the vegetable garden, and the winter work. The last of these is an experienced carpenter, who has care of the planing and carving benches, the repair of the garden tools, and the oversight of the chamber furniture. Additional help is given by pupils who have been trained in the institution, and who, after their confirmation, learn gardening as their future occupation. These have to go through a three years' course in the institution without paying any fees. After a certain time of probation they receive a compensation, which increases, according to the capacity shown, in the second and third years. The oldest boys have charge of the flowers, the watering, and the pot-plants, and from four to eight boys are in this department, while the younger boys have their regular and appropriate tasks. Every day the superintendent sets for them and the overseers the work which is required by the season of the year.

This school is very popular at Weimar, and it has been found necessary to enlarge the farm. It attracts not only the children of the poor, but those of the middle and the upper classes, and it has been found remarkably serviceable in putting the idle boys of the place to work, and in giving new health and cheerfulness. The time of labor is limited to vacation holidays, to the weekly half-day holidays, and on school-days to the afternoon from four to seven o'clock. The labor is made cheerful by order and variety. The older and the younger boys serve in heavy and light work suited to them, and much is done to encourage them by judicious rewards. Their winter work is of various kinds, from basket making to straw braiding and envelope folding, and they sing a merry song as they work, or a story is told, or one of the older boys reads from a pleasant book. This school is supported by free gifts and by the proceeds of sales of produce. One source of income is from the sale of nosegays, which are delivered every week, and paid for at a monthly rate. The whole city is richer and better by this institution, and the minds as well as the bodies of the pupils show the benefit of out-door life and industrial education.

Why should garden schools be for boys only?

Girls need their influence quite as much, and they are especially fitted for the nicer kinds of garden-work. In fact, they generally show such taste and ability in the management of flowers that they take to the pruning-scissors and the trowel of themselves, and probably we owe most of the flower beds of America to them. Our daughters have been brought up too much in the shade, and they have lacked the rose on the cheek and the strength of limbs that the air and the sunshine give. A change for the better is going on, and the effect is quite marked in complexion, form, and movement. There is no colorist like the sun, and a woman is foolish when she prefers pallid white to his nut-brown bloom, or when she seeks by artifice for the rosy hue that can come only from the rays that tint the lily and the rose. Moreover, grace of figure and movement comes in part from the vibration and tonic of the sunshine, and Greece, which made Apollo the god of the sun, won from the solar ray and the genial air the beauty of form that enabled the sculptor to model his Apollo from the living manhood.

We have reason to believe that the solar rays have peculiar power over the nerves and brain, and that the finest mental culture goes with the happiest condition of the sun and the air. The vine has its most luscious juices and its most witching charms in the latitudes and exposures that best command the sunshine; and man, who is a plant as well as an animal and a soul, follows after his kind, and his finest wit and genius seem to ripen best where the vine best ripens. Such exquisite senses and souls as Beethoven, Haydn, and Mozart, those masters of song, possessed grew up under the sunshine that falls upon the vineyards of the Rhine, and their music thrills with vibrations that seem to be voices of the undulations of light. For the blessing of genius, and for the health and taste and intelligence of the people at large and their children, we must use more the help of the sun, and gardening and education must go more habitually together.

We are glad to say a word for the out-of-door sport and activity of young people, and to urge the thousands of girls and boys who read these pages to take freely to the fields and the woods, now that the summer is coming. Take your eyes and ears and hands with you, and see and hear the beauty and the harmony of all nature at this season of life and joy. Run and jump and climb and wade as you will, and be careful to make notes of whatever is remarkable in your way. You will be stronger and wiser from this experience, and you will return to your books and your school with new interest and vigor. You will unlearn the folly of mistaking words for knowledge, and notions for facts, and abstract rules for living forces. A new day has come in education, and you must be awake and stirring under its light. Science is calling her students to the new school of nature in an island of the sea, and we may follow her call, if not to that island, to some retreat where things may be seen in themselves, and words may be their representatives without being their substitutes.

We are aware that great agitation is now going on in the class of institutions and powers that have belonged to our easy craft, and that there are signs of a change of opinion as to what is an easy seat. Thrones are somewhat losing their good name, and they are either abandoned in despair, as in France and Spain, or they are so marvelously transformed as hardly to be recognized, and the king or the emperor is called to exchange the velvet cushion for the hard saddle of the soldier, or the stiff chair in the cabinet council or at the treasury desk. It is pleasant to believe that one seat is becoming easy, and that is one which concerns not a single person or a single class, but all the boys and girls in Christendom—the school bench or chair. What shall be the height and size of the seat, what the angle and curve of the back, how shall the desk in front be adapted to the seat, shall the chair be movable toward the desk for writing, or shall the desk be movable toward the chair, as the last decision declares—these are questions that are stirring the friends of education, especially in Europe, and making a new literature on the subject. We are very much interested in this discussion, but must be content at present with protesting against the narrow benches, angular backs, and cramping desks that crook the spines and dwarf the chests of our school-children, and with claiming, in the name of God and nature, for our hosts of girls and boys free air and fair sunshine in their play, and wholesome rooms and easy seats for their study.

Editor's Literary Record.

POETRY.

Farm Ballads (Harper and Brothers) comprises in a volume of a little over a hundred pages, and handsomely illustrated, the poems of WILL CARLETON. Most if not all of them have appeared from time to time in American periodicals, several of them in *Harper's Weekly*, and the public verdict has already been rendered: it is one of very hearty approval. Mr. Carleton is happiest in his delineation of the homelier phases of American life and character. His best poems are such as "Betsey and I are out," and its sequel, "How Betsey and I made up;" or "Over the Hill to the Poor-House," and its sequel, "Over the Hill from the Poor-House." In sentiment, as in the "Fading Flower," and in tragedy, as in the "Death-doomed," his poetry is good, but less notable. But in these home pictures Mr. Carleton is as an artist not inferior to Bret Harte, John Hay, or Joaquin Miller, while both in the moral tone and in the warmth and healthfulness of feeling he is vastly their superior. The life and character which he depicts are rough, but not coarse, and he neither thinks it necessary to make his pages redolent with profanity, nor to shock his readers by blasphemy, nor to irritate them by torturing the English language in order to be true to nature. In his best poems the pathos and humor are so commingled that one scarce knows whether to laugh or to cry, and the interwoven threads defy separation. It is a notable feature of these poems that they exalt home and the home life,

and that they depict a love which is absolutely free from sensuousness or passion.

The character of the literature of the age is its realism. To paint things as they are is deemed the office of imagination. The charm of WILLIAM MORRIS'S poems is that there is nothing realistic about them. They make the reader forget the world of fact: they carry him into one of fancy. Mr. Morris's latest poem, *Love is Enough* (Roberts Brothers), is a dream. One must be in a dreamy state to enjoy it. It is a September afternoon, when a delicious haze is in the air, and clothes the hills with a glorious indistinctness, and the very vagueness of the curtained landscape adds to its indescribable glory. The poem defies analysis. It has scarcely more of plot than a dream, and is as impossible to interpret. It possesses charming passages, yet it defies quotation as well as analysis. One can judge less of it as a whole from a sample verse than he could judge of the beauty of a rainbow, if he had never seen one, from a square inch of refracted light passed through a prism. To many, perhaps to most casual readers, this poem will seem incomprehensible, and they will ask, bewildered, what it means. But as there is music whose meaning is beyond interpretation, so there is poetry which the soul drinks in with an enjoyment which it can not itself comprehend or interpret to others. *Love is Enough* is like one of Beethoven's sonatas: the reader who is out of key to its melody sees nothing in it. He who is attuned to the poet finds in his music an enjoyment all the greater that he can neither interpret its secret to himself nor communicate it to others.

Lars: a Pastoral of Norway, by BAYARD TAYLOR (J. R. Osgood and Co.), is a less pretentious poem than his previous one, *The Masque of the Gods*, and it is as much better as it is simpler. It is, in truth, a parable whose moral meaning is what Milton calls "the unresistible might of weakness." The opening is dark with passion and red with blood. Lars and Per, rival Norwegian lovers, fight for Brita; Per is slain; Brita finds in the instant of his death that her love was for him; Lars becomes an exile, not for fear of punishment, revenge, or reproach, but because the land is filled with her who was his hope, but is now his desolation and despair. In Pennsylvania he finds a Quaker wife and imbibes Quaker principles, and, returning home, conquers the hate of his rival's brother, and puts an end to the bloody custom that gave the right of revenge to the next of kin, by offering his life a sacrifice, which not even revenge can take from a willing victim. The picture of the last encounter, in which Lars bares his breast to Thorsten's knife, and saves his life by the very undaunted courage with which he offers it, is finely conceived and finely painted. The whole poem will take rank as not only the finest production of Mr. Taylor's pen, but as one which entitles him to the name and rank of a true poet.

The Temple Rebuilt (Noyes, Holmes, and Co.), by FREDERIC R. ABBE, is an attempt to portray in verse the experience of the soul in its history, from the consciousness of its dignity down through the experience of guilt and consequent despair, and up again through its redemption in Christ, its development in grace and its work of love, to its hope of final glory. The theme is transcendent; the treatment is not. Such a poem, to be worthy of itself, must be either wrought out of a rare experience, and so interesting for its spiritual insight, or wrought by a rare genius, and so powerful for its appeal to a spiritual imagination. Mr. Abbe's book is neither; and though it is really a meritorious poem, its merits are so far beneath those which such a theme requires that the book is a disappointment. It is orthodox in thought, pure, simple, and Christian in sentiment, and not noticeably faulty in construction; but it is only the experience of millions put into a verse not superior to that which scores might phrase. As a dramatic poem it is not equal to the seventh and eighth chapters of Romans.

Most American readers know Hiawatha only as the purely imaginary hero of Longfellow's romantic poem. The anonymous author of *Hiawatha: the Story of the Iroquois Sage* (A. D. F. Randolph and Co.), conceding that Mr. Longfellow has "selected those aspects best adapted for pictorial effect," undertakes in a little volume of thirty pages to give a conception of Hiawatha, the Indian hero, "more consistent and dignified than that popularly entertained." The poetry of his story is a pleasant rhyme, which suffers more than it justly should from the inevitable comparison with that of Longfellow. The main value of the book is as a contribution to the popular knowledge of the life of the red man.—Scribner, Armstrong, and Co. issue a very neat and convenient edition of the complete poetical works of J. G. HOLLAND under the title of *Garnered Sheaves*. The volume is red-lined, is printed on good though thin paper, with clear type, and is very fairly illustrated. Mr. Holland's popular success as a poet entitles him to this honor, and his many literary friends will welcome this edition of his poems.—*More Bab Ballads* (George Routledge and Sons) is so well described by its title-page as "Much Sound, little Sense," that it needs no other or further characterization from us. The humor of both poems and illustrations is very broad—the humor of nonsense—but it is humor nevertheless.

FICTION.

THERE are two Bulwers, the old and the new, the author of *Paul Clifford* and *Eugene Aram*, and the author of *The Caxtons* and *My Novel*. *Kenelm Chillingly* (Harper and Brothers) is by the modern BULWER. It is a picture of modern life, painted by one who is more a philosopher than an artist, and more a critic than either, and whose pictures are but the vehicle for his philosophy and his criticism. The hero is an odd genius, in whom a romantic chivalry is intermixed with a misanthropical contempt of human kind, who is at once the dreamiest of idealists and the most satirical of realists. Of noble blood, and an heir to large property, he leaves his home to study life from the point of view of a country yeoman. He travels at first on foot, and carefully guarding his incognito, subsequently preserving it less carefully, and carrying himself in a manner more befitting his station. He begins with a philosophic contempt for love and a cynic's contempt for woman. But love wounds him at last, and he learns that there are truths whose depth philosophy has never sounded with her plummet. In truth, through-

out his curiously adventurous career his idealism recognizes love in others, and with the chivalry of an English Don Quixote he defends the defenseless, while his realism despises love for himself, and makes a show of putting but light estimate on the very spirit of honor which actuates him. The moral of the story—for it has a moral—is embodied in the closing sentences: "The world is a battle-field, in which the worst wounded are the deserters, stricken as they seek to fly, and hushing the groans that would betray the secret of their inglorious hiding-place.....My choice is made: not that of a deserter—that of a soldier in the ranks."

Old Kensington (Harper and Brothers), in a course of professional perusing of the novels of the period, seems like an April day interjected into a stormy March. It is full of the odors of flowers and the singing of birds, and though tears sweep through it, yet the sunshine is upon them. They are not the cold and bitter rain of a sunless autumn day. It is a story of love without passion, and of pathos without tragedy. Its very placidity makes its reflection of life more perfect. Its characters have not the strong individuality which gives such singular vividness to the creations of George Eliot, but they are not one whit less real. In truth, the men and women of our daily life, if not more like those of *Old Kensington* than like those of *Middlemarch*, are more commonly seen through the less intellectually clear, but more sympathetic, atmosphere of the latter book. The story in its external incidents is quite as simple as *Middlemarch*. Its interest lies partly in the successive pictures, partly in the development of character, partly in the tale of inner life unfolded, but chiefly in the contagious sympathy of Miss THACKERAY's warm heart. We follow Dolly's heart experiences with an interest which we catch from the living sympathy of the author. The story of George's waywardness, wandering, and sudden death touches us deeply, because it has touched the writer first, and our eyes are dimmed with tears because the voice which tells us the story is tremulous with unaffected feeling. In short, the tenderness of a loving, womanly heart suffuses the whole book. It is Miss Thackeray in *Old Kensington* which makes it so delightful a story.

Pemberton; or, One Hundred Years Ago, by HENRY PETERSON (J. B. Lippincott and Co.), is a historical novel of the American Revolution, in which the treachery of Benedict Arnold and the capture of Major André play an important part. The author has evidently made a study of the era in which he has cast his story, and he has written not a mere wild romance, but a real if not always a true picture of the times. The historical characterization gives evidence, too, of a painstaking study of character which is not very often bestowed on works of this description. He gives to Major André a more "noble soul" than really belonged to him; but something is permissible, perhaps, to fiction, and the death of André, and the contrast of his character with that of Arnold, has always invested him with an honor greater than is his by right. The book is ingeniously written, and will be especially interesting to young readers.

Thornton Hall, by PHEBE F. M'KEEN (A. D. F. Randolph and Co.), is a picture of boarding-school life in a young ladies' seminary, and is written by one whose familiarity with the subject is the result of a life spent therein, part of the time as a scholar, part of the time as a teacher. It has merit; and though the critics may not award it an especially high rank for artistic excellence, it will prove acceptable both as an entertaining and instructive story to a large class of readers: to all parents who have daughters who are about going to school, for the hints it affords them as to the true principles which should underlie school training; to all girls about entering school, as an introduction to its life and a suggestion of its dangers; to all graduates, as a reminiscence of days whose recall is generally delightful, whatever the reality may have been; and to all teachers, less for any light it throws on methods than for the thorough geniality and sympathy of the spirit which it manifests in the author and inspires in the reader.

WILHELMINE VON HILLERNE has produced nothing, at least nothing from her pen has been given to American readers, which is not remarkable for vigor both of thought and expression. *A Twofold Life* (J. B. Lippincott and Co.) falls in no whit below her previous novels. The second chapter interprets the title of the story. In a delirium Heinrich becomes conscious of two selves within him, each striving for the mastery—Egotism, and the Genius of the Ideal, and each becomes embodied in a visible apparition. At their united command he feels himself divided, made, as it were, into two separate beings, endowed with a double nature. The motto of the one is "Enjoy;" the motto of the other is "Attain." The rest of the story is the life campaign between these two natures, each striving for the supremacy. Throughout the book a double name is given to the now twofold man, who is alternately Henri and Heinrich. Yet this opening chapter is almost the only one in which metaphysics are obtruded; for though the novel is essentially a metaphysical one, its philosophy is all expressed in dramatic forms. The authoress possesses both a curiously subtle intellect and a vivid and even sensuous imagination. The latter she uses to good advantage, and by its aid makes her story effective as a novel, irrespective of its philosophical aspects.—*Galama; or, The Beggars* (Charles Scribner and Co.), is what is ironically called a historical novel. The scene is laid in Brussels and vicinity during the opening of the Reformation, which ended in the emancipation of the Netherlands. The beggars, the Inquisition, the beginning of civil war, with a discreet admixture of love, make very excellent materials for a romance, full enough of adventure to satisfy the hungriest novel-reader. We must do the author the justice to say that he has made a very good use of his materials.—If *Little Hodge* (Dodd and Meade) is a story, and there is a little love intermixed with it to give it the flavor of a novel, it is a failure. If it is a satirical essay, a discussion of the labor problem in its English aspects, it is a success. It follows very closely the line of the author's first and most successful venture, *Ginx's Baby*, only this baby is the child of a farm-hand, and his life introduces the reader to the miseries which Joseph Arch is so bravely endeavoring to cure.—*Nicholas Nickleby* is the latest volume in

"Harper's Illustrated Edition of the Works of Charles Dickens." Mr. C. S. Reinhart, who illustrates it, has taken a high rank among American artists for character-drawing, and he does nothing in this volume to dishonor either his own growing reputation or that of the series to which he contributes. His work does not suffer by comparison with that which in the other volumes has been produced by the best English and American contemporary artists. There is perceptible, perhaps, in some of the sketches something of the spirit of exaggeration; but this is the chief fault, and is one so commonly imbibed by the artists from Dickens, whose exuberant fancy can not always be interpreted by the pencil, that the reader will readily pardon it.

THEOLOGY AND RELIGION.

BOOKS of mere assault and criticism are at best but of secondary value. Those who propose to us to cast off the Christianity of the past as a worn-out garment owe it to us and to themselves to show what new garment they have to offer in its stead, and this rather difficult task Mr. Frothingham, with a clear conception of the need, and a courage worthy of a better cause, has attempted in his *Religion of Humanity* (D. G. Francis). Unlike many of the disciples of his school, Mr. Frothingham has an intuitive appreciation of the needs of the human heart, and consequently recognizes that the Christian religion rests not in its external evidences, but in the spiritual satisfaction it affords. He, perhaps for this reason, deals but slightly in criticism; instead, he points out the substitutes which he would offer for a closed Bible and an exiled Christ. He brings another Gospel—he does not merely criticise the old—and his work is in consequence a curious commingling of the mystical and the critical, the spiritual and the rationalistic, the like of which is hardly to be found elsewhere. It is because his work offers the substitute proposed by Free Religion for the religion of Christ that it deserves especial consideration at the hands of thinking men. He believes in a God, but in one unknown and unknowable, and declares that "the most unintelligible sayings about God are the most impressive to the religious mind;" he believes in an incarnation, but in a God "who is not so much *a* man as Man;" he believes in a Christ—not in the historical Jesus of Nazareth, but in an ideal Christ, whom he defines as "the human element in mankind;" he believes in an atonement, which consists in bridging "the gulf betwixt the animal and the human elements in man;" he believes in salvation, "by throwing ourselves enthusiastically upon the virtue of our rational powers;" he believes in inspiration, which in its highest and best forms is found in those who are "filled and fed from the perennial fountains of their own abounding hearts;" he believes in a Bible, "the literature of the soul," "found in strata all over the earth." The result of a comparison of the proposed religion of humanity with the religion of Christianity, as embodied not in creeds and confessions, but in the New Testament, and especially in the four Gospels, will not lead many who have any firm grasp on the substance to drop it that they may seize at the shadow. But for such a clear and succinct statement of the proposed substitute Mr. Frothingham is entitled to the thanks of all those who desire to know what modern skepticism desires them to surrender, and what it has to give them therefor.

Foot-Prints of Satan; or, the Devil in History, by Rev. HOLLIS REID (E. B. Treat), possesses a real value which one might not suspect from its title. It is not a book of morbid imagination, but one which bears in every chapter the evidences of painstaking research. The statistics of war, intemperance, the perversion of wealth, the perversion of literature, Romanism, paganism, free divorce, etc., are presented with a fullness which we have not elsewhere seen equaled.—*The Wonderful Lamp, and other Talks to Children*, by ALEXANDER MACLEOD, D.D. (Robert Carter and Brothers), is an admirable book for Sabbath evening reading aloud to the young folks, who will perhaps hardly read it themselves. The author possesses the same peculiar power of illustrating spiritual truths in forms easy to be comprehended by children which has given Dr. Newton's somewhat similar works so wide-spread and deserved a popularity.—*Comfort Ye*, by J. R. MACDUFF, D.D. (Robert Carter and Brothers), is an exposition of the last twenty-seven chapters of the book of Isaiah. It does not claim to possess any critical value, and is an exposition, not a commentary. But if it does not directly add to the original by any peculiar freshness of interpretation, it compels the reader to dwell on passages whose beauty and force often escape our attention simply because of careless and indifferent reading. It is an aid to meditation rather than to study.—We had the good fortune to hear one of the six discourses which constitute *The Lost Found*, by Rev. W. M. TAYLOR, D.D., of the Broadway Tabernacle, New York (Scribner, Armstrong, and Co.), a series of sermons on the parables recorded in the fifteenth chapter of Luke. The simplicity, homeliness of illustration, strong common-sense, directness, practicality, and spiritual warmth which make Dr. Taylor's preaching so successful are all strikingly exemplified in this little volume, which will be read with interest, as the preacher is heard with interest, for reasons which the heart appreciates but the head finds it difficult to explain.—In *Enigmas of Life* (J. R. Osgood and Co.) W. R. GREGG conducts his readers to no satisfactory conclusions, and does not even attempt to do so, but he compels his readers to think. He presents puzzles, but does not solve them; his book is one of enigmas to which he offers no key, and its value consists in the fact that it compels the reader to study out for himself the truth respecting important themes upon which Mr. Gregg offers him only provoking yet stimulating interrogatories. The style is remarkably clear, and at times eloquent, and the writer, who refuses himself to be mystified by words without wisdom, offers no such mystifying words to his readers.—The theological critics will find much to criticise in Mr. MURRAY'S *Music-Hall Sermons*, Second Series (J. R. Osgood and Co.). They are sometimes careless in statement. But they are plain, simple, earnest, direct, and modern; and we read them without any surprise that they should have been listened to by large congregations, and with the hope that they may find many readers.—The *Sunday Half Hours with Great Preachers*

(Porter and Coates) contains fifty-two sermons from as many leading clergymen, ancient and modern. All schools are represented which accept the Bible as their basis, and the selections appear to be, on the whole, wisely made.—The death of Dr. GUTHRIE, the foremost modern preacher of that land of preachers, Scotland, gives a new interest to *The Works of Dr. Guthrie*, of which the Carters issue a uniform edition. The title of one of these books gives the characteristic of them all—*Speaking to the Heart*. It is this peculiar power, not the clear and accurate statement of the truth, not the vivid pictorial power which illustrates and enforces it, that gives to his writings their peculiar charm.—There has been a considerable demand for a book which should answer, not in an abstruse and scientific, but in a popular manner, the arguments of the modern evolutionists, and thus afford to common readers a means of satisfying themselves of the grounds on which Christian faith in a personal God and a superintending Providence is to be maintained against the new hypothesis which substitutes a gradual evolution for a Divine creation. Dr. BURR has undertaken to meet this want in *Pater Mundi*, Second Series (Noyes, Holmes, and Co.). He presents the theory briefly, weighs and replies to certain arguments in its favor, and then impugns it in successive chapters as in conflict with ontology, geology, the science of probabilities, solar astronomy, stellar astronomy, and nebular astronomy. As a popular embodiment of the arguments against evolution the work is decidedly worthy of commendation.—The present movement for a new translation of the Scriptures imparts a special interest to such a work as *The Historic Origin of the Bible*, by EDWARD CONE BISSELL (A. D. F. Randolph and Co.). The history of its growth and its preservation is almost as marvelous as any marvel recorded in it. That history is itself no mean argument for its inspiration as well as its authenticity. The work includes a history of, first, our English version; second, the written text and ancient version of the New Testament; third, the origin and canon of the Old Testament. It is only necessary to add that the author appears to deserve the commendation given to him by Professor R. D. Hitchcock, in an introduction, as "an ardent and critical scholar," who "has spared no pains to be sound and accurate in his conclusions."—Any detailed criticism of *Faith and Free Thought* (A. D. F. Randolph and Co.) would far transcend our limits; for the work consists of eleven lectures by different English divines, each of which is independent of the others, and would require a separate judgment. We can only say that in general the authors of these lectures appear to appreciate the difficulties which beset many honest minds at the present time, and that in the main they discuss those difficulties in an appreciative spirit, which tends to put their readers in sympathy with them, and to secure the attention of those who most need a solution of doubts. They are controversial without being combative or pugnacious.

RECENT ENGLISH BOOKS.

THE slave-trade is far from being as yet abolished; and the recent interest awakened in Great Britain, partly through the representations of Dr. Livingstone, finds full justification in the facts recorded in *Dhow Chasing in Zanzibar Waters*, by Captain G. L. SULLIVAN. The dhow, or baggala, is a native craft made to draw but a few inches of water, used for coasting purposes on the eastern coast of Africa, and employed alike in legitimate commerce and in the more profitable slave-trade. The extent of that trade is indicated by a few figures—such, for example, as that in two years over two thousand negroes were liberated by the expedition with which Captain Sullivan was connected; that the tax paid to the Sultan on slaves reported to be exported indicates the capture and exportation of over twenty-five thousand annually; and that this tax only represents a portion of the slave-trade, certainly not more than half, and that inadequately. Of this trade and of the practical measures for its suppression Captain Sullivan's book gives some idea in an account of adventures experienced in three cruises for the capture of the slave-dealers. The book is quite fully illustrated, and deserves study by philanthropists and statesmen in this country as well as in England.

Those who are familiar with Dean ALFORD'S *Commentary on the New Testament* in either of its forms not only recognize its scholarship and its impartiality, but yet more the deep, genuine, and thoroughly unaffected piety of its author. They learn in the use of it to love him who wrote it; and though the number of Dean Alford's readers and consequent friends in this country is not very large, we can not forbear calling their attention to the *Life, Journals, and Letters of Henry Alford, D.D., late Dean of Canterbury*, edited by his widow. The life was an uneventful one, but its record is full of inspiration, especially to the student. We could wish the editor had given us more information as to his literary habits—how, with his parish work, his students, his poems, and his published sermons and occasional articles, he succeeded in perfecting such a work as his Commentary. But if she has failed in this, she has not failed in giving her readers an insight into the working of his mind, and an acquaintance with his earnest and yet broad and liberal spirit. No better defense against the theological aspersions sometimes cast upon him could be offered than this biography, which is the more effective because pervaded by his own Christian and uncontroversial spirit. It is a lesson for less busy men than Dean Alford to find one so loaded down with multitudinous labors carrying on a long correspondence with a person of another parish who comes to him in religious perplexity for light, explaining in private letters doubtful and difficult questions in theology and criticism with as much fullness and conscientiousness as if they were essays for publication, and writing a letter to a young girl of his parish on her going out to service, giving her counsel respecting her new duties, and signing himself with a humility as delightful as it is unaffected, "Your affectionate minister and brother in the Lord."

Mr. MATTHEW ARNOLD'S latest contribution to theology is, like all his writings, worthy of careful study. The object of *Literature and Dogma* is to show that the Bible language is that of literature, not that of dogma or philosophy; that its most important terms are vague and shadowy, not precise and well-defined; that, for example, the word God itself is, to quote our

author's words, "a term thrown out, so to speak, as a not fully grasped object of the speaker's consciousness," and does not convey "a thoroughly definite and ascertained idea." It is his opinion that the Bible is losing its influence over the masses because it is misinterpreted, and made to carry a load which does not really belong to it, and his book is an attempt to clear away this load, and present what he regards as the essential teachings of the Bible itself, the spirit as opposed to the letter. To Mr. Arnold all miracles, all prophecies, and all well-defined theological ideas are extrabiblical, no part of the true Bible, save as the shell is part of the nut. To crack this shell, and throw it away, and get out the meat, is his avowed purpose. In doing this he shows himself at times either ignorant of Biblical criticism or supremely contemptuous of it, we are not sure which. It is not fair to uninformed readers to tell them that the reference to Shiloh, in Genesis, xlix. 10, does not relate to a future Messiah, when the best Hebrew scholars agree in giving it, both etymologically and grammatically, a prophetical interpretation; or to treat the prophecy in Matthew, xxiv. 34, "This generation shall not pass till all these things be fulfilled," in seeming ignorance of the fact that the Biblical use of the word "generation" calls for its translation here, as in other passages, by the term "nation." So his argument against miracles is not only not new, it is not even strongly put, and he writes with a curious oblivion of the argument respecting the historic truthfulness of Christ's real resurrection, the falsity of which he apparently assumes as beyond question. But in his interpretation of the heart of the Bible he is more successful. He opens up its great fundamental teachings respecting righteousness as a life that flows from the invisible God, and presents old and familiar truths in a guise which gives them all the force of new ones. Critically and grammatically, "grace and truth came through Jesus Christ" is a better rendering than the one which he suggests; but "happiness and reality came through Jesus Christ," though inadequate, yet gives to the old text a new meaning, and to the thoughtful reader a new insight; and those to whom such words as "regeneration" and "repentance" have ceased to carry with them any real spiritual significance will get the ideas which they were intended to convey, if not with equal accuracy at least with greater force, in Mr. Arnold's interpretations of the truths they embody. If Mr. Arnold really desired to commend the essentials of Biblical teachings to his readers, he would have accomplished his object more effectually if he had presented them without the destructive, sometimes contemptuous, and often wholly inadequate criticism which accompanies them, and which leaves one at times perplexed to know whether he is reading the pages of an enthusiastic disciple of Christ or a misanthropical unbeliever in both Him and His religion.

MISCELLANEOUS.

HOWEVER much Mrs. AMES herself may have regretted the lack of material from which she prepared her *Memorials of Alice and Phœbe Cary* (Hurd and Houghton), we are inclined to rejoice that the author was thus left to introduce us in her own way to the home and hearts of the sister singers. By reading her simple and graphic sketch we are admitted to the number of the familiar friends of Alice and Phœbe Cary. We have a glance at their childhood and early life, a glimpse of the humble home which they made for themselves in New York at the first, and a clearer and better view of the last years in the beautiful home which fitted itself about them. No more honest and tender love and no readier pen could have combined to give a memorial of the sisters whose love to one another and entwined life make a poem no less exquisite than their written words.

The Annual Record of Science and Industry for 1872 (Harper and Brothers) is the second of the series, the first of which we commended to our readers a year ago. It is perfectly safe to say that of the scientific year-books, of which three or four are published, this is by far the most thorough and complete. It is edited by Professor BAIRD, of the Smithsonian Institution; its materials are gathered not only from the Smithsonian Library, but also from over seventy-five scientific periodicals, embracing all the principal scientific periodical publications of this country and Europe. The work is introduced by a general summary of scientific and industrial progress during the year 1872, and the analytical table of contents renders it easy to refer to any topic, or even any important fact. A necrology embracing the principal losses by death during the year 1872 in the ranks of men of science is appended.

The Foreigner in Far Cathay (Scribner, Armstrong, and Co.) is less a book on China than a series of observations respecting China and the Chinese by one who ought to have good means of knowing whereof he writes—W. H. MEDHURST, British consul at Shanghai. It gives a very graphic picture of the life of foreign residents in China, and corrects some very common impressions respecting the habits and character of the native population. His suggestions respecting missionary methods indicate a man of broad and liberal mind, and the whole tone of the book is that of a fair, impartial, and candid writer, who desires only to give the truth, and who feels no temptation to sacrifice it to rhetoric, to dramatic effect, or to religious or political prejudices. His *quasi* defense of the opium trade is the only exception, and a defense the end of which is the assertion that "it can not be asserted that the association involves any more demoralization of character to the individual than a connection with the beer, wine, or liquor trade" can not, perhaps, be justly regarded as extravagant.

The Mother's Work with Sick Children (G. P. Putnam's Sons) is a translation by a physician from the French of another physician. This fact gives the work a certain authority which popular medical works do not always possess, while it imparts to it its only considerable fault: it presupposes too much knowledge on the part of the mother. We recognize the difficulty of writing on scientific subjects without using scientific terminology; nevertheless, a work intended for popular use ought not to require such a glossary as is appended to this. Notwithstanding this defect, the book deserves high praise. It is not beyond the apprehension of most mothers, if they are willing to give its oc-

casionally obscure passages a little thoughtful study. It begins with a general consideration of the work of the mother in the physical care and training of children. It then proceeds to give specific and practical information on such topics as the proper remedies to constitute the mother's pharmacopœia, the right use of them in cases that do not call for medical advice or do not admit waiting for it, the indications which the mother may recognize of approaching disease, the proper care of the sick, and the proper administration of the sick-room. It is provided with an excellent index, which enhances its value as a book of reference; but its chief value is as a treatise for the mother's reading at her leisure, rather than for her hasty reference in times of special exigency.—There are not many mothers who will find time to understand and fill up the record, for which provision is made in the *Mother's Register* (G. P. Putnam's Sons), which is intended as a note-book of the children's health. It contains some useful information, compressed into very concise foot-notes; these and its provocation to a study of children's physical condition constitute its chief practical value.

We think it was Goethe who laid down as the three canons of criticism three test questions to be asked and answered: first, what does the author propose to do? second, is it worth doing? third, has he done it well? Applying these questions to *Siam, the Land of the White Elephant, as it was and is* (Scribner, Armstrong, and Co.), we see no reason to doubt that the editor and compiler has done his work fairly well, but great reason to doubt whether it is a work worth doing at all. The book opens with an account of the geography and ancient history of Siam, which appears to have been obtained from well-known and trustworthy sources. Then follows the matter contributed by the editor himself, the record of observations in Bangkok sixteen years ago, since which time the more important changes in the civilization of Siam have taken place. Then we have "Sir Harry Ord's Visit to Hua-wan," from the *Bangkok Calendar*, a journal published in the city of like name, and the six or eight chapters of Mouhot's "Travels, Explorations, and Adventures." A "Journey from Bangkok to Birmah," from the pen of Dr. Collins, an American missionary, is next given. The remaining chapters are made up from the writings of Bishop Pallegoix, Sir John Bowring, Dr. Bradley (a resident missionary), and Mrs. Leonowens. The map and illustrations do not add materially to the value of the work. The map of Siam, Cambodia, the Laos country, etc., is evidently the same as that attached to M. Mouhot's travels, and the illustrations are, with three or four exceptions, taken from the same work. Several of the English general atlases of the world contain maps of Siam (and the other lands of Indo-China as well) which are ten years more modern, and hence more full and accurate than is this map. Some of the illustrations, too, do but sorry justice to their subject. The "reigning First King of Siam" might fairly institute a libel suit against the engraver who gives the caricature on his majesty's handsome and intelligent features; and the picture of the "present Second King" is no better. In short, the book is but a compilation of works of travels whose information is too often rendered inaccurate by important changes which have taken place since they were written, or by inaccuracy of language, of which the title is itself an illustration. Siam is in no proper sense the "land of the white elephant," whose home embraces the entire central portions of the Chin-Indian peninsula, from Bengal to Cochin China, and whose name is assumed as a part of his royal title by the King of Ava, "Lord of many White Elephants." In truth, these albinos—whose whiteness, by-the-way, is not the effect of disease, as is indicated by this book—are seldom found within the strict boundaries of the kingdom of Siam. The editor has probably been misled by the fact that a white elephant on a red ground is its national standard. But we do not look for unicorns and lions in Great Britain because these emblems are on its national crest. It is not, however, to errors of this sort that we chiefly object, but to the fundamental conception which underlies not only this volume, but the series of which it is a part. We have a right to expect of such a library of travel that it will discriminate for the reader, and will sift out the true from the false, which this series does not do. It is because the countries of Indo-China are so little known that the general reading public are satisfied with *Romances of the Harem*, and other kindred publications. Not being able to contradict ingenious though marvelous statements from personal knowledge and experience, all is accepted as the truth, until some may appear who really know of what they speak, and also speak of no more than they know. We have taken this volume of a popular series because the series is popular, and because, of its kind, the book is fairly well done, in order to emphasize more strongly our protest against the whole system of book-making by any process, however skillful, of editing and compiling of information antiquated, and therefore inadequate and inaccurate, on subjects on which the public needs and is entitled to have the best, the latest, and the most trustworthy information.

Miss CATHERINE BEECHER has devoted her life to studying herself and instructing others in that nameless modern science which we may, in lieu of a better name, entitle "practical sociology," by which we mean the practical art of healthy and happy living in modern society, especially in the home circle. The *Housekeeper and Health-keeper* (Harper and Brothers) is a compend of her past utterances on these subjects; but it is also much more. It is the final result of thoughts, observations, philosophies, and suggestions which have survived the sifting processes of time and actual trial. It embraces the whole range of family life, from the preparation of a meal to the right management and culture of children. A peculiar mellowness and softness and absence of rigidity, which age, when instructed by experience, sometimes but not always brings, constitute the most manifest qualities of the volume, and render it far better and more helpful than any book of mere rules and recipes, though these are not wanting; and a thoroughly Christian and as thoroughly unconventional spirit breathes through the entire volume. She recognizes no true home but the Christian home. The young housekeeper may,

indeed, at first be discouraged by the very excellence of the standards which Miss Beecher sets up; but on further examination she will find the directions so detailed and so explicit that she can not misread, and we venture with some assurance to prophesy that, having once used it as a guide-book in the difficult but important art of housekeeping, and the more difficult and more important art of home-keeping, she will not be willing to surrender it again, nor will the members of her kingdom be willing that she should.

Editor's Historical Record.

POLITICAL.

OUR Record closes on the 28th of April.—The extra session of the Senate closed March 26. The long debate on Senator Caldwell's expulsion was terminated, March 24, by the Senator's resignation. A resolution was passed exonerating Senator Clayton from the charges made against him. In regard to the case of Senator Bogy, the Committee on Privileges and Elections requested to be discharged from the duty of further investigation.

Resolutions were passed during the session providing for the meeting of several of the important committees during the recess. Among these are the Committee on Transportation, that on Privileges and Elections—having special reference to modes of electing the President and Vice-President—and that on the Mississippi Levees. In regard to these levees, army engineers who have investigated the matter report the probable cost to be about $36,000,000. The Southern people claim that a large part of this amount would be saved every year as a result of the improvement. In 1861 the levees extending for 1504 miles had been constructed at a cost of $35,000,000. The yield of the plantations protected by them was 688,254 bales of cotton, and 460,000 hogsheads of sugar—worth $74,000,000. The ravages of the war have reduced these levees to a useless condition. In consequence, the sugars of Cuba and Brazil have taken the place of those of Louisiana, and a cotton crop estimated at 7,000,000 bales has been annually lost to the markets of the world.

The Committee on Transportation has already had before it the postal car question. There are fifty-eight lines of railroad running postal cars, and the Post-office Department is endeavoring to extend the system. The postal car is, in fact, a traveling post-office, in charge of an agent, who sorts the mail matter while the car is in motion. This system has been of great advantage, preventing long delays in the delivery of mail matter. Just before the close of the last session Congress passed a law increasing the compensation for this kind of transportation to the extent of $500,000 dollars, and authorized the Transportation Committee to sit during recess and investigate the "nature and extent of the obligations subsisting between the railroad companies and the postal service." The pay for railway mail service was adjusted according to the weight of matter carried, being per annum, for each mile, as follows: for a daily weight of 200 pounds, $50; of 500 pounds, $75; of 1000 pounds, $100; of 1500 pounds, $125; of 2000 pounds, $150; of 3500 pounds, $175; of 5000 pounds, $200; and $25 additional for every additional 2000 pounds. This advance was secured by the Postmaster-General with great difficulty, and was by him deemed insufficient. The presidents of some of the lines leading from New York threatened to take off the postal cars on the 1st of April, but in view of the investigation being made by the Senate committee they suspended action.

Mr. George William Curtis on the 18th of March resigned his position as a member of the Advisory Board of the Civil Service. He stated as his reason for resigning that the circumstances under which several important appointments had been recently made seemed to him to show an abandonment both of the spirit and the letter of the civil service regulations. Mayor Medill, of Chicago, has also resigned. In the place of these gentlemen, Dorman B. Eaton, of New York, and Samuel Shellabarger, of Ohio, have been appointed Commissioners by the President.

The new charter for New York city was finally adopted by the New York Legislature April 16. It abolishes the Board of Assistant Aldermen after January 1, 1875. The Mayor is to nominate and, with the consent of the Board of Aldermen, appoint all the heads of departments, and may remove them for cause. The Controller, Commissioner of Public Works, Corporation Counsel, President of Public Parks, and the President of the Police Department are retained in office during their present term. In the reduction of salaries of the leading officials there is a saving of over $350,000 annually, as compared with the old charter.

The New York Legislature, among its other failures, has not met the popular sentiment on the question of usury. Governor Dix in his last message recommended the repeal of all usury laws as a blot on our statute-books. The neighboring States have already accomplished this reform. The laws as existing in New York can not be enforced. They are also partial, since they allow corporations to loan money at rates exceeding that which is established by the general law. The fact that there has been a combination of individuals, and perhaps, as Recorder Hackett suggests, of some banks through brokers and middle-men, to diminish the circulation of money in regular channels, so as to raise the percentage for its use in irregular channels, to the profit of those combining for this end, and that this conspiracy is an offense against common law, has brought the subject before the Grand Jury of the General Sessions in New York city. The presentment made by this jury, April 17, declares that that body has been unable to trace the reason for the present stringency in the money market, the usury laws being so unpopular that not a man can be found who will aid the authorities in discovering transgressors of them. It attributes to these very laws the enormous rates that are paid for money in New York

city, and thus the merchant and trader are embarrassed by the scarcity of money, owing to its withdrawal from its legitimate channels. It recommends the repeal of all usury laws, or a modification of them in their application to the city and county of New York.

The Senate of the New York Legislature, April 23, passed the Assembly bill entitled "An act to regulate interest and prevent usury." It continues the seven per cent. rate of interest. It provides that no person shall take a greater rate of interest than seven per cent. But the forfeitures and penalties attached are of such a character as to amount to almost nothing. The principal is not forfeited, but only the interest. The borrower or the lender may forestall any penalty beyond taxable costs by an offer before the institution of legal proceedings to give or accept the legal rate of interest.

The New Jersey Legislature adjourned April 4. It had passed the General Railroad bill; also a bill for the local taxation of all railway property heretofore exempt in view of paying a State tax. A Civil Rights bill was passed, giving colored citizens all the rights and privileges of whites. The various temperance projects, including Local Option, were defeated; also the bill to make education compulsory. The State taxation was increased fifty per cent. rather than divert from the school fund the proceeds from the sales of land under water.

Governor Parker, of New Jersey, has appointed, in consonance with the resolution passed by the Legislature, April 4, two persons from each Congressional District to prepare amendments to the constitution of the State for submission to the next Legislature.

The two Houses of the Kentucky Legislature are divided on the question of local taxation for the support of the common-school system in that State—the Lower House insisting upon submitting the question to a majority of the resident real estate owners. As the report of the Senate Committee, April 17, justly says, "To give land-holders alone of all the people the right to declare whether or not the boys and girls of Kentucky shall be educated, would be to inflict a stab which, if not fatal, would certainly cripple and destroy the efficiency of the great system to which the poor and needy look as their only hope for the mental development of their offspring."

A disgraceful collision between whites and negroes has occurred at Colfax court-house, in Grant Parish, Louisiana, on the Red River. The reports are conflicting. This much seems evident: A body of negroes was called out by Sheriff Shaw to defend the court-house from an attack threatened by the supporters of the M'Enery government, who had gathered in large numbers for that purpose from the neighboring parishes. The collision took place April 13. The negroes were defeated, and a general massacre followed. The court-house was burned. It is stated, on the authority of United States Marshal S. B. Packard, that there was no loss on the part of the colored men until after their surrender, when they were murdered in cold blood. He reports that his chief deputy buried the remains of sixty negroes found on the field. A steamer, with a detachment of United States troops on board, started for Colfax.

State elections have taken place in Rhode Island, April 2, and Connecticut, April 8. Henry Howard, the Republican candidate, was elected Governor of Rhode Island by a majority of over 5000. Charles R. Ingersoll, the Democratic candidate, was elected Governor of Connecticut by a majority of 3237. From the first three Congressional Districts Republican Congressmen were elected, among them J. R. Hawley; from the fourth W. H. Barnum, Democrat, was elected. The Democrats gained largely in the State Legislature.

At the meeting of the Mormon Conference in Salt Lake City, April 8, Brigham Young resigned his position as trustee in trust of the Church. He announced his intention of going so far south that the telegraph would not reach him. He will probably have a following, and establish a new settlement in Arizona or Sonora.

In the British House of Commons, April 7, Mr. Lowe, the Chancellor of the Exchequer, presented his financial budget for the year ending March 31, 1873. He announced a reduction of the debt of £6,861,000. The actual revenue exceeded the estimated by nearly five millions of pounds. Mr. Lowe proposed to provide for the payment of half of the Geneva award out of the revenues of the present year without additional taxation, and announced that the government was enabled to propose a reduction of fifty per cent. in the duty on sugar, and to take off a penny from the tax on incomes. On April 24 these propositions were passed, except that reducing the duty on sugar, which was recommitted.

A bill for the exile of members of the Bonaparte family was passed March 29 by the French Assembly, 347 to 291. M. Grévy, President of the Assembly, resigned that position April 2. It is reported that he will assume the leadership of the Left in the Assembly, a position heretofore accorded to Gambetta. M. Louis Buffet was elected President April 4. The election in Paris, April 27, to fill the vacancy in the Assembly resulted in the choice of M. Barodet (Radical), who received 180,146 votes. Baron Stoffel received 27,058, and Count de Remusat (Thiers's candidate) 135,406. The elections in Marseilles and Bordeaux were also carried by the Radicals.

In the Prussian House of Lords, March 10, Prince Bismarck made an important speech in advocacy of the constitutional amendment upon which the new Church laws are to be based.

The Electoral Reform bill, which has been passed by the Austrian Reichsrath, and received the sanction of the Emperor, is an important triumph for the people. The bill provides for the election of members of the Lower House by all persons entitled to the suffrage—the number of members to be increased to 120. The votes are to be given in writing. Those entitled to vote in one province are to be eligible in all. The representatives of large landed proprietors will be increased fifty per cent., it is estimated; and these and those for the towns are to be returned by direct election.

It has been officially estimated at St. Petersburg that the three Russian columns from Orenburg, the Caucasus, and Turkestan would arrive on the borders of Khiva by the 1st of May. It appears from the manifesto published in this

connection in the *Invalide Russe* that the Russian government has exhausted every pacific resource, and that the Khan of Khiva persists in retaining the Kirghese prisoners, and in rejecting all overtures for a commercial treaty with the Governor-General of Turkestan similar to those established between that officer and the chiefs of Khokan, Bokhara, and Tashkend. In 1869 the Russian government occupied a point on the bay of Krasnovodsk (on the eastern shore of the Caspian) for the erection of a fortified factory, in order to attract a portion of the Central Asian caravans toward the banks of the Caspian, to secure the safety of the nomad subjects of Russia in the neighborhood of the sea, and to improve the relations of the government with Khiva. In order to secure the new commercial route thus projected between the Caspian Sea and Central Asia it is necessary that Khiva should be either Russian or subject to Russian influence.

The prospect of a Russian invasion seems to have frightened the Khan of Khiva, who is reported to have executed his chief counselor, imprisoned his uncle and other influential Khivans inimical to Russia, and released the Russian prisoners.

M. Vámbéry estimates the population of the khanate at about 500,000, divided into sedentary and nomadic tribes. The khan can place in the field 25,000 cavalry, and a few auxiliary squadrons, all poorly commanded. The khanate's best defense, says Vámbéry, is the desert by which it is surrounded, in parts of which no water is to be found, and where the heat of summer and the cold of winter are alike insupportable.

A war has been in progress between the Dutch East India government, in the island of Sumatra, and the kingdom of Achen, in the northern part of the island. The Achenese have violated treaty obligations, and have been guilty of robbery, and of kidnaping men, whom they sold as slaves. The Dutch forces, after unsuccessful attempts, costing them the loss of forty-five killed and over four hundred wounded, have resolved to suspend hostilities until next autumn.

The Shah of Persia left Teheran April 19 on a tour to Europe.

THE WESTERN FARMERS.

The Association of Patrons of Industry had its origin in Iowa about two years ago. The main object of the association at the outset was to procure, through the agency of granges, or bands of farmers established in every township in the State, farmers' implements on the co-operative plan. The association was a secret society, having its ceremonies of initiation and a symbolic ritual. A pleasant feature of the order is the prominence given to social intercourse among the members. The farmers take their wives and daughters to the granges; indeed, the formation of granges is impossible without a certain ratio of lady members. Among other properties possessed by each grange are a well-selected library, a piano or a melodeon, a microscope, botanical, mineralogical, or entomological specimens, and similar facilities for intellectual entertainment or scientific study. The ritual is pleasing, and in one of the degrees occurs a social festival. This order, therefore, helps to relieve the tedium and dreary isolation which are the unpleasant characteristics of country life.

The legitimate business of the grange embraces every thing that can be advantageous to its members. Among the more prominent matters now fairly inaugurated and in good working condition may be mentioned a systematic arrangement for rapidly procuring and disseminating information relative to crops; the aspect of demand and supply; prices in various markets; the cost of transportation from point to point by various routes; the establishment of dépôts for the sale of special products, so as to bring the consumer in direct contact with the producer; also for the purchase and exchange of live stock, seeds, plants, and fruits of all kinds; facilities for procuring help and labor at home or from abroad, and work for those seeking employment; a well-guarded system of testing and ascertaining the merits of newly invented or newly introduced farming machinery and implements, the results of which are at once communicated to all the members of the order.

From Iowa this order has spread eastward into Ohio, Illinois, and Indiana, and through Tennessee into Northern Mississippi and Alabama. One-third of all the grain elevators and warehouses in Iowa are owned or controlled by the granges, and before last December over 5,000,000 bushels of grain were shipped by them to Chicago. The number of cattle and hogs shipped in the same manner is enormous, and with increased profits to the farmers. In the purchase of agricultural machinery and implements the purchases made through the grange have saved to its members $365,000 by actual computation. Not less than $100,000 will be invested during the year 1873 by the granges in establishing manufactories, and thus, by the bringing of skilled labor among them, will a home demand for the products of the farm be created.

Inspired by the same purpose as these granges are the organizations in Illinois, Ohio, and other States known as farmers' clubs, or farmers' associations. It is estimated that of the 1500 townships in Illinois over 800 have organized clubs, or granges, the average membership being one hundred.

The most important of the farmers' conventions met at Springfield, Illinois, April 2. Out of the 102 counties in the State 73 were represented by 291 delegates. The resolutions adopted declare that chartered monopolies not regulated and controlled by law have proved detrimental to the public prosperity; that railways, except in those countries where they have been held under the strict regulation and supervision of the government, have been instruments of arbitrary extortion, and have been as much opposed to free institutions and free commerce as was the feudal system of the Middle Ages; that a despotism "which defies our laws, plunders our shippers, impoverishes our people, and corrupts our government" must be subdued and made to subserve the public interest; that the State can not create a corporation which it can not thereafter control; that there is occasion for alarm in the contemplation of an interest which combines in the hands of a few men a capital of nearly $250,000,000 in the State of

Illinois, and $4,000,000,000 in the Union; that it is the duty and within the power of the Legislature to pass laws fixing reasonable maximum rates for freight and passengers, without classification of roads; that the existing statute providing for a classification of railroads, with a view to adjusting a tariff of charges according to the gross amount of earnings, is a delusion and a snare, and is so framed that the railroads are able to classify themselves, and that it should be carefully modified or repealed; that inasmuch as the Supreme Court has clearly pointed out the way to reach the unjust discriminations made by the Illinois railroads, the necessary laws on this subject should be enacted by the Legislature without delay; that a bill should be passed declaring railroads public highways, and requiring railroads to make actual connections with all roads whose tracks meet or cross their own; that legal rates of fare should be insisted upon; that the provision of the State constitution of 1848 prohibiting the granting of special railroad charters should be strictly enforced, and also the provision of the constitution of 1870 prohibiting the issue of watered stocks; that Congress should repeal all laws "preventing the competition of small vessels which may choose to engage in the carrying trade on our inland lakes, between ports in the United States, without regard to nationality;" that the protective duties on iron, steel, lumber, and materials which enter into the construction of railway cars, steam-ships, sailing vessels, and agricultural implements, should be immediately repealed; that the laws making the stocks of railroad corporations personal property should be repealed, and the law so amended as to withdraw such stocks from speculation and give to them the permanency and certainty of ownership of the railroads themselves; and that the railroads (now assessed at not over one-tenth of their value) should pay taxes on the full value of their property.

The following is the substance of the platform adopted at the recent convention of the farmers of California:

Repeal of the taxes on growing crops; repeal of the tax on mortgages; establishment of San Francisco as a free port for interior commerce; repeal of the Federal tariff on grain sacks and material for grain sacks; and the establishment of a maximum freight rate for railroad transportation.

The Illinois Legislature has not, at the time we write, completed its Railway bill. In the place of the Hildup and Donahue bills, a compromise bill combining the best features of these has been passed by the Assembly. Some important amendments to the bill were adopted in the Senate April 24. The fact that no special rates were allowed in the Assembly bill for transportation of freight in large quantities shows how partial is the knowledge of legislators when they come to treat of great measures. The same thing is shown in the proposed amendment to the Pennsylvania constitution, which is intended to prevent the consolidation of railroad lines.

In pursuance of the call of Governor Smith, of Georgia, there will be a convention of the Governors of the Southern, Western, and Southwestern States at Atlanta, Georgia, May 20, to consider measures for the accomplishment of the Atlantic and Great Western Canal, by which it is proposed to connect the Tennessee River, and through that river the entire system of Western inland navigation, with the Atlantic Ocean at Savannah and Brunswick, Georgia.

Governor Carpenter, of Iowa, has addressed letters to the Governors of the Northwestern States, containing references to a meeting held at Des Moines some three months ago, with a view of calling a convention of delegates from the several Northwestern States and Territories to devise means for the improvement of the Fox and Wisconsin rivers and the Huron and Ontario Canal, and to make such arrangements as will tend to promote the early consummation of these enterprises.

INDIAN AFFAIRS.

The massacre of Major-General E. R. S. Canby and the Rev. E. Thomas, D.D., Peace Commissioners, by the Modocs at the lava beds, in Oregon, April 11, has brought the whole Indian subject again to the foreground.

The Modoc Indians have been for a score of years unfriendly to the whites. A treaty made in 1864 provided for the setting apart of a tract of land of about 768,000 acres in Southern Oregon for this tribe. A part of the tribe settled on this reservation. Captain Jack's band, however, preferred to stay at their old homes near Clear Lake. Late in 1869 Captain Jack and his band were, not without difficulty, persuaded, in view of certain amendments made to the treaty, to settle upon the reservation. Early in 1870 there was trouble between the Modocs and Klamaths, and they were separated, the former being removed to another part of the reservation. Disturbances were soon renewed, which resulted in the departure of the Modocs. In his report for 1871, Mr. A. B. Meacham, who was wounded in the recent massacre, and who was then Superintendent of Indian Affairs for Oregon, recommended the establishment of a separate reservation for the Modocs near their old home—the tract indicated by him being six miles square, and lying partly in Oregon and partly in California. But his suggestion was not acted upon. An agreement was made with the Modocs that they should not be disturbed until definite action was taken by the Indian Office, provided they refrained from theft and disturbance. The Modocs proved restive, and in the spring of 1872 Mr. T. B. Odeneal, who had succeeded Mr. Meacham, concluded that they had by their maraudings forfeited all claim to consideration under this agreement. April 12, 1872, Commissioner Walker wrote to Odeneal directing the removal of the Modocs to the Klamath Reservation. June 17, Odeneal replied that he did not believe the removal practicable at that season of the year without using the military for the purpose; and then, if the Modocs should resist, success with the force at hand seemed doubtful. He asked for a postponement until September, which was granted. The Modocs refused to be removed, and Captain Jackson with thirty men (of Colonel Wheaton's command) reached the Modoc camp November 29, and upon his demand that the Modocs lay down their arms, the Indians opened an attack, which lasted for two hours, when they escaped. That day eleven citizens were murdered by the Indians. The camp was surrounded, and on January 17 a severe en-

gagement occurred between Colonel Wheaton and the Modocs, in which the troops were defeated and forced to retire, with a loss of forty killed and wounded. All attempts to dislodge the Modocs from their fastnesses in the rocks of the lava beds proved fruitless, and a Peace Commission was appointed. On March 3 the Peace Commissioners reported that the Indians had agreed to surrender and to be removed to a southern and warmer climate. A second dispatch, March 4, to Secretary Delano reported that they emphatically rejected all offers and propositions. A new Peace Commission was organized, March 16, composed of General Canby, Dr. Thomas, Mr. Meacham, Judge Rosborough, of Yreka, California, and Mr. Dyer, of Oregon.

On the 22d March General Canby telegraphed to General Sherman as follows:

"I think that a system of gradual compulsion, with an exhibition of the force that can be used against them, if the Commission should again fail, will satisfy them of the hopelessness of any further resistance, and give the peace party sufficient strength to control the whole band. Time is becoming of the greatest importance, as the melting of the snow will soon enable them to live in the mountains. This will greatly increase the difficulties we have to contend with, as they will then break up into small parties, and can more readily make their escape from their present location."

Several parleys were held, at which the Modocs were insolent in manner, and their brutality reached its culmination in the treacherous massacre of April 11. Since that melancholy event several attacks have been made upon the Modocs, but no report of any decisive results has reached us at the time we write this.

An important epoch or transition point was marked by the declaration made by Congress March 30, 1871, that "hereafter no Indian nation or tribe within the territory of the United States shall be acknowledged or recognized as an independent nation, tribe, or power with whom the United States may contract by treaty." As Commissioner F. A. Walker has lately written, these would have seemed brave words to William Penn, Captain Miles Standish, or Captain John Smith. They show that the day of block-houses has gone by. But, for all that, the complete mastery of the perplexing Indian question is not yet ours. We are still resorting to measures of expediency, still postponing a decisive conflict, knowing that soon the necessity for conflict will disappear. According to the report of the Indian Commissioners for 1872—

"Three years will see the alternative of war eliminated from the Indian question, and the most powerful and hostile bands of to-day thrown in entire helplessness on the mercy of the government. Indeed, the progress of two years more, if not of another summer, on the Northern Pacific Railroad, will of itself completely solve the great Sioux problem, and leave the 90,000 Indians ranging between the two transcontinental lines as incapable of resisting the government as are the Indians of New York or Massachusetts. Columns moving north from the Union Pacific and south from the Northern Pacific would crush the Sioux and their confederates as between the upper and nether millstone; while the rapid movement of troops along the northern line would prevent the escape of the savages, when hard pressed, into the British possessions, which have heretofore afforded a convenient refuge on the approach of a military expedition.

"Toward the south the day of deliverance from the fear of Indian hostility is more distant; yet it is not too much to expect that three summers of peaceful progress will forever put it out of the power of the tribes and bands which at present disturb Colorado, Utah, Arizona, and New Mexico to claim consideration of the country in any other attitude than as pensioners upon the national bounty. The railroads now under construction or projected, with a reasonable assurance of early completion, will multiply fourfold the striking force of the army in that section; the little rifts of mining settlements now found all through the mountains of the Southern Territories will have become self-protecting communities; the feeble, wavering line of agricultural occupation, now sensitive to the faintest breath of Indian hostility, will then have grown to be the powerful 'reserve' to lines still more closely advanced upon the last range of the intractable tribes."

By the time this Record reaches our readers it will have been decided whether recent events have developed a new situation, rendering a general Indian war inevitable. It has been just this situation that the government has been for years striving to avoid by a policy that, from a superficial view, has been pronounced pusillanimous and wasteful. Individual murders have been allowed to go unpunished. Two and a half millions of dollars are spent annually in the subsistence of Indians without reference to their ability or disposition to work, so that the average cost of the Indian service has gone up from four millions in 1866, 1867, and 1868 to seven millions at the present time. The increase is due to this system of feeding Indians. Commissioner Walker, though he justifies the system, does not hesitate to admit that it is paying blackmail to insolent savages. He claims that points of dignity can only arise between equals. "With wild men, as with wild beasts, the question whether to fight, coax, or run is a question merely of what is easiest or safest in the situation given.... Grant that some petty Sioux chief believes that the government of the United States feeds him and his lazy followers out of fear or out of respect for his greatness—what then? It will not be long before the agent of the government will be pointing out the particular row of potatoes which his majesty must hoe before his majesty can dine. The people of the United States are great enough, and sufficiently conscious of their greatness, to indulge a little longer the self-complacent fancies of those savage tribes, if by that means a desolating war may be avoided."

The cost of a general Indian war, as estimated by Mr. Walker, would "reach an aggregate not much short of that of the year of largest preparations and largest operations during the rebellion"—this apart from the humane consideration of the exposed condition of our frontier settlements. He quotes from the report of a commission, comprising such officers as Generals Sherman, Harney, Augur, and Terry, rendered to the President January 7, 1868, in which they use the following language in reference to the "Chirrington massacre" and the Cheyenne war of 1864:

"No one will be astonished that a war ensued which cost the government thirty million dollars, and carried conflagration and death to the border settlements. During the spring and summer of 1865 no less than eight thousand troops were withdrawn from the effective force engaged in suppressing the rebellion to meet this Indian war. The result of the year's campaign satisfied all reasonable men that war with Indians was useless and expensive. Fifteen or twenty Indians had been killed, at an expense of more than a million dollars apiece, while hundreds of our soldiers had lost their lives, many of our border settlers had been butchered, and their property destroyed."

"This," says Mr. Walker, "was the experience of the United States in a contest with an

Indian tribe numbering, perhaps, 4000 men, women, and children, and able to bring into the field not one-fifth as many warriors as the Sioux bands of to-day. Not to go back to wars waged with tribes now subjugated or extinct, were we to cast up the expenditures involved in the Sioux war of 1852–54, the Cheyenne war of 1864, just referred to, the Navajo war, the second Sioux war in 1866, the second Cheyenne war in 1867, we should undoubtedly reach a total greatly exceeding one hundred millions of dollars."

He estimates the potentially hostile tribes as numbering 64,000 Indians. "Of the Sioux of Dakota, tribes, bands, and parties, to the number of 15,000; of the Indians of Montana, Blackfeet, Bloods, and Piegans, Assiniboines, and roving Sioux, to the number of 20,000; of the Indians in the extreme southwestern part of the Indian Territory and on the borders of Texas, Kiowas, Comanches, Cheyennes, and Arrapahoes, to the number of 7000; of the Indians of Arizona, Apaches of several tribes, to the number of 9000; of the Mountain Indians of Colorado, Utah, and Nevada, to the number of 5000; of the Indians of New Mexico, to the number of 2000; and of the Indians in Oregon and Washington Territory, to the number of 6000."

But he does not consider it probable that in a general Indian war the government would be called upon to fight more than one-half of these Indians at any one time.

The Indian Commissioners state that nearly five-sixths of the 300,000 Indians of the United States and Territories are civilized or partially civilized. The Commissioner of Indian Affairs divides them as follows: civilized, 97,000; semi-civilized, 125,000; wholly barbarous, 78,000. Of the civilized Indians the Cherokees are the most advanced. They number 15,000, and have a reservation in the Indian Territory of four million acres. "They have their own written language, their national constitution and laws, their churches, schools, and academies, their judges and courts. Their dwellings consist of 500 frame and 3500 log houses. During the year 1872 they raised 3,000,000 bushels of corn, besides large quantities of wheat, oats, and potatoes, their aggregate crops being greater than those of New Mexico and Utah combined. Their stock consists of 16,000 horses, 75,000 neat cattle, 160,000 hogs, and 9000 sheep..... The Cherokees have sixty schools in operation, with an aggregate attendance of 2133 scholars. Three of these schools are maintained for the instruction of their former negro slaves." There are in the Indian Territory from 40,000 to 45,000 Indians in the same general condition as the Cherokees.

Mr. Walker recommends the adoption of the reservation system as the general and permanent policy of the government. "The number of Indians now having reservations secured to them by law or treaty is approximately 180,000. The number of such reservations is ninety-two, ranging in extent from 288 acres to 40,750 square miles, and aggregating 167,619 square miles. Of these reservations thirty-one, aggregating 2693 square miles, are east of the Mississippi River; forty-two, aggregating 144,838 square miles, are between the Mississippi and the Rocky Mountains; and nineteen, aggregating 20,068 square miles, are upon the Pacific slope. In addition to the above, 40,000 Indians, having no lands secured to them by treaty, have had reservations set apart for them by executive order out of the public lands of the United States. The number of reservations thus set apart is fifteen, aggregating 59,544 square miles."

These reservations, Mr. Walker thinks, should be consolidated, so that the territory assigned to the Indians west of the Mississippi shall constitute one or two grand reservations. The tract now known as the Indian Territory would accommodate 250,000 Indians, giving each man, woman, and child 120 acres. If there are two reservations, then, besides the Indian Territory, there should be another tract set apart farther north for the Sioux, Crows, Poncas, Arickarees, Flatheads, Blackfeet, Northern Cheyennes, Arrapahoes, etc., numbering altogether 54,000. "The intrusion of whites upon these reservations should be provided against by legislation." Also, Indians should be compelled to remain on their reservations. Then "a rigid reformatory control should be exercised by the government over the lives and manners of the Indians of the several tribes, particularly in the direction of requiring them to learn and practice the arts of industry, at least until one generation shall have been fairly started on a course of self-improvement."

Such are the main features of what is known as the peace policy. The Commissioners claim that under its operations the number of outrages have steadily diminished. Still it is on trial, and the question has yet to be answered whether it will accomplish its main object—the prevention of a general Indian war. It must be understood, however, that this policy is not applied to Indians in actual hostility. These come under the jurisdiction of the army, and the army, as General Sherman says, "has no policy about Indians or any thing else. It has no voice in Congress, but accepts the laws as enacted, and the interpretation thereof by the proper officials, and executes them with as much intelligence, fidelity, and humanity as any other body of citizens."

General Sherman has always been of the opinion that the Indian Bureau should be under the conduct of the War Department instead of under that of the Department of the Interior. He says, in a recent letter:

"From the organization of the government up to 1850 the Indians and Indian Bureau were under the War Department, so that nearly all the civilization and Christianization of the Indians thus far accomplished occurred under army supervision. To-day, in case an Indian suffers a wrong, I believe he will be more likely to appeal to the commanding officer of the nearest military post than to his own agent; for in the one he sees with his eyes the evidence of a force to compel obedience, whereas in the other nothing of the kind. In like manner, I believe the annuities to treaty Indians would reach the parties in interest quite as surely through army officers as through civilians. And when Indians have committed depredations—as is very common—and the annuities are chargeable with the amount of damages, such stoppages could more safely be made by a commanding officer having soldiers at his back than by an agent afraid of his life—as too many of them are, and have reason to be. The present Indian agents, as a class, are very good men; but they lack the force, the power, which savages alone respect."

The general holds all the Modocs responsible for the late massacre. On the 12th of April he issued an order to General Gillem to make the

attack so strong and persistent that the fate of the Modocs might be commensurate with their crime. He adds, "You will be fully justified in their utter extermination."

In the letter above alluded to, he says:

"This whole matter must be left to the officers on the spot, and these must be sheltered against the howl of such as followed Major Baker after the Piegan attack, as also General Custer after his attack on Black Kettle's camp. There is not much danger of too much harm being done. To be effective and exemplary, the blow must involve the terrible; enough to impress the kindred tribes of Klamaths and Pi-Utes. I believe the civilians and soldiers wish the same end, and, in fact, do not differ much as to the process. All Indians must be made to know that when the government commands they must obey, and until that state of mind is reached, through persuasion or fear, we can not hope for peace."

Even Mr. Walker admits the force which a brilliant campaign, like that of General Crook in Arizona during the past season, has in impressing the Indians with a sense of the power of the government. He shows that certain of the so-called—and sometimes properly so-called—massacres perpetrated by the army, or by the frontier militia, have had very effective results. "Colonel Baker's attack upon a Piegan camp in 1869, even though it should be held to be justified on the ground of necessity, must be admitted to be utterly revolting in its conception and execution. Yet no merited chastisement ever wrought more instant and durable effects for good. The Piegans, who had been even more wild and intractable than the Sioux, have since that affair been orderly and peaceable. No complaints whatever are made of their conduct, and they are apparently as good Indians as can be found among the wholly uncivilized tribes."

LABOR STRIKES.

It has been carefully estimated that the strike of last year involved a direct loss of $4,000,000 to the business of New York, which was about equally divided between the workmen and employers.

The strike of the colliers and iron-workers of Wales had a duration of between two and three months. During that time over 60,000 persons were idle. These men are said to have been receiving at the time of the strike $300,000 weekly, and the stoppage of this vast sum has brought untold misery and suffering to the workmen and their families. The miners have lost $2,000,000 in wages, while the unions have only contributed $75,000 to their wants. After all this, the result is that the men are compelled to go to work at nearly the old wages. The prospective strike in New York is having a serious effect on the business of the city. The number of buildings under contract is unusually small. Those having contracts have already made extensive arrangements for doing as much as possible of the work at other points near New York, one job of stone-cutting, the largest in the city, being under contract in Jersey City, by which $150,000 is lost to New York workmen.

The Legislature of Illinois, March 19, passed a bill attaching severe penalties to intimidations resorted to in strikes.

On the 5th of April the gas-men employed in the works of the New York Gas Company (East Twenty-first and Twenty-second streets, New York city) struck for the adoption of the eight-hour system. The men, about two hundred in number, were dismissed. They failed to persuade the gas-men of the Manhattan and other companies to join them. Men from Ward's Island and from other companies supplied the places of the strikers, but at first so inefficiently that the streets in the lower part of the city were without light after ten o'clock on the night of the 5th. But this difficulty was soon overcome. There were some outrages committed on the new men. The strike proved an utter failure for want of co-operation, and the New York Company lost more from the unskillful work of the new men, and the necessity of maintaining a large police force to protect these men and the works, than would have paid the cost for a year of the additional gang of workmen which the adoption of the eight-hour system would have required.

At the blast-furnace of the Western Iron Company, in Knightsville, Indiana, there was a collision, April 15 and 16, between the negro laborers from Virginia and the white miners and puddlers, who were on a strike, and whose places the negroes had filled. The disturbance was quelled by the arrival of police and military from Indianapolis.

The committee recently appointed by the Massachusetts Legislature to inquire into the condition of operatives in manufacturing towns report, after visiting all the larger towns and cities, that there is no call for legislative interference in regard to the hours of labor in factories, or the employment of women and minors.

Now that the interests of agriculture are being made so prominent in connection with the issues raised between the farmers and the railroads, it is inevitable that a new question must enter into the consideration of all labor problems—what will be the effect upon the agricultural interests of a general strike of the mechanical trades for a day's work of eight hours without a reduction of wages? According to the report of Mr. David A. Wells, the Special Commissioner of Revenue for 1869, the gross values created by the various industries of the country amounted to $6,285,000,000, which were assigned as follows:

Agriculture	$3,282,950,000
Cotton manufacture	71,500,000
Woolen manufacture	66,000,000
Iron production—pig and bar	119,950,000
Leather manufacture	222,600,000
Railway service	360,000,000
Fisheries	100,000,000
All others	2,602,000,000
Total	$6,825,000,000

This is given as the value of the total products of the labor of each of these classes. The census of 1870 gives the total number of persons engaged in paid occupations at 12,505,923. Of these, 5,922,471 are employed in agricultural labor. In round numbers, one-half the population employed in labor of all kinds are employed in agriculture. Dividing the whole value of the labor by the number of persons engaged in it, the product is an average of $546 each per annum. But this enumeration of occupations embraces every variety. It is estimated that there are about one million of skilled laborers, mechanics, whose average wages are $750 per year, whose labor with its incidents is worth one thousand millions of dollars. The average value of the product of each person engaged in agri-

culture, including all its branches, is $554. The reduction of the number of hours of all other labor one-fifth, without any reduction in its cost, will levy an additional tax of twenty per cent. upon every article which farmers have to purchase. As the number of persons thus burdened constitute one-half of our laboring population, it will be difficult to effect the proposed change in our industrial economy through political enactments or through an appeal to popular opinion.

MISCELLANEOUS.

According to the Bureau of Statistics, our imports for the eleven months ending November 30, 1872, amounted to $633,999,597, as against $550,545,174 for the corresponding period of 1871. Our domestic exports amounted to $492,092,500, as against $463,121,594 in 1871; our foreign exports to $23,362,380, as against $25,141,439 in 1871.

Allowing for the difference in the warehouse account, the imports for the eleven months ending November 30, 1872, are in excess of the domestic and foreign exports, combined, to the amount of $117,767,227, while for the eleven months ending November 30, 1871, the imports exceeded the exports by only $48,611,567.

An important decision was rendered by the Supreme Court of Illinois, March 24, declaring telegraph companies responsible for the correct transmission of messages where the message is not repeated.

The new Indiana divorce law provides that no divorce shall be granted unless the applicant can prove by at least two witnesses a *bona fide* residence of two years within the State, forbids the person obtaining the divorce to marry again within two years, and limits the grounds for the divorce to the causes specified in the present statute.

An important opinion has been delivered by the Supreme Court of Illinois, through Judge Thornton, as to the legal liabilities of a husband for the conduct of his wife. Judge Thornton decides that since "the relations of husband and wife have been so changed as to deprive him of all right to her property, and to the control of her person and her time, every principle of right would be violated to hold him still responsible for her conduct." It is impossible, therefore, to recover damages from the husband for slander perpetrated by the wife.—In this connection it may be mentioned that a bill is before the British House of Commons, which has passed to a second reading, giving a married woman the right to hold property independently of her husband, and to control her own earnings.

The storm in Nebraska about the middle of April seems to have been as fearful in its results as that of Minnesota last January. Men were frozen to death within two rods of their dwellings while feeding their stock. Houses were blown down, and families were compelled to resort to the cellars, or perished in the attempt to reach the neighbors. The destruction of cattle was very great.

At a dinner recently given by the national bank presidents of Philadelphia in his honor, the Hon. A. G. Cattell stated the object of his mission abroad to be the facilitation of the refunding of the national debt at a lower rate of interest. The arrangements for carrying out this object have been made by an agreement between the government and a syndicate composed of the most eminent bankers in this country and Europe. The parties to this syndicate are Messrs. Jay Cooke and Co., representing Messrs. H. M. Rothschild and Sons, Messrs. Jay Cooke, M'Culloch, and Co., and themselves, for one-half, and Messrs. L. P. Morton and J. P. Morton, representing Messrs. Baring Brothers and Co., Messrs. J. S. Morgan and Co., Messrs. Morton, Rose, and Co., Messrs. Drexel, Morgan, and Co., and Messrs. Morton, Bliss, and Co., for the other half. Already, under the management of Secretary Richardson, $200,000,000 of the six per cent. have been exchanged for five per cent. bonds, resulting in an annual saving in interest of $2,000,000.

The census for 1870 shows that in the past decade New England has increased in population 350,847, or a little over 11 per cent., which is just about half the rate (22.22 per cent.) of the increase of the whole country during the same period. Of this increase 168,170 was by the immigration of foreigners, and 182,677, or under 6 per cent., by births. The ratio of increase by births was much the largest in those States in which the number of foreign-born persons was greatest. In New Hampshire, where the foreign-born citizens are fewest, and received the smallest number of accessions during the decade, the population did not increase at all, but, on the contrary, fell off 7773. Rhode Island, whose total population is less, but whose foreign-born population is double that of New Hampshire, gained 24.47 per cent., which is above the average. Massachusetts, with the enormous foreign population of 353,319, and having in her midst 590,352 persons both of whose parents were foreign born, added 226,285, or 18.38 per cent., to her population.

We are now able to give the official estimate of the actual loss sustained by the Boston fire. The value of the property destroyed was estimated by the commissioners appointed to inquire into the causes of said fire to be $70,000,000. Of this amount there was covered by insurance—

In Massachusetts companies	$35,411,104
By companies of other States	15,818,520
By foreign companies	4,864,458
Total insurance	$56,094,082

There has been or will be paid in full of this amount:

By companies of other States and foreign companies	$20,495,343
By Massachusetts companies	15,180,000
By companies of other States not paying in full	1,200,000
Total	$36,875,343

Of the Massachusetts stock companies doing business in November last only eleven survived the catastrophe, and of the fifteen mutual companies doing business in Boston four were rendered insolvent by the fire. It is a remarkable fact that the merchants and property-holders of Boston, who will receive on their gross insurance $65\frac{73}{100}$ per cent., realized within $2,500,000 of the whole amount of the sum received by the people of Chicago, though, according to the estimates in both cases, the loss in Chicago was $48,000,000 in excess of that of Boston.

The mortality of the principal cities of the world for 1871 has been estimated as follows,

by the death rate per 1000: New York, 28.6; Philadelphia, 22.9; St. Louis, 16.9; Chicago, 23.3; Baltimore, 26.7; Boston, 23.5; Cincinnati, 22.3; New Orleans, 29.2; San Francisco, 21.5; Buffalo, 13.9; Washington, 14.6; Louisville, 23.5; Newark, 23.7; Cleveland, 19.5; Richmond, 34.4; Charleston, 31.1; Petersburg, Virginia, 43.8; Havana, Cuba, 45.8; Montreal, Canada, 36.9; London, England, 24.7; Liverpool, 35.1; Glasgow, 32.9; Dublin, 26.2; Paris, 54.7; Berlin, 38.9; Vienna, 35.7; Rome, 30.7; Florence, 37.6; Naples, 39. The large rate for Berlin and Paris was due to the late war.

DISASTERS.

March 30.—At Shughan Station, on the Rutland and Washington division of the Rensselaer and Saratoga Railroad, the express train was thrown from the track, which had been undermined by water. Two men were killed and twelve injured.

April 1.—The steam-ship *Atlantic*, of the White Star line, from Liverpool to New York, while putting into Halifax for a fresh supply of coal, struck, while running at full speed, upon a rock fifty yards from Meagher's Island, and in a few minutes became a total wreck. There were 957 persons on board, of whom 535 were drowned, all the women and all but one of the children being included among the lost. The *Atlantic* sailed from Liverpool March 20, commanded by Captain James A. Williams. About the 27th she encountered a gale which continued three days, during which she made comparatively slow progress. At noon on the 31st she was 460 miles from Sandy Hook, with only 127 tons of coal in her bunkers. On leaving Liverpool she had a supply of 967 tons, of which 80 were used before the voyage commenced, leaving only fourteen days' supply had the coal been of the best quality, which it was not. Hence the necessity for putting into Halifax. At midnight of the 31st the captain went below, leaving the vessel in charge of the second and fourth officers. Sambro Light was not seen, though the sky was clear; nor did the officers see the land before the fatal shock. When the ship struck, it was at a point thirteen miles westward of that for which her officers supposed she was making. The ship had been in soundings for eight hours, but the lead was not once used, nor were any of the precautions taken which are usual when approaching land. Yet, notwithstanding this acknowledged lack of vigilance, by which a thousand lives were periled and over half that number actually lost, the Halifax Commission, by way of penalty, simply deprives the captain of his certificate as extra master and master for two years, and the certificate of the fourth officer is suspended for three months. The Commission reports that the conduct of Captain Williams and his officers after the ship struck "seems to have been all that could be demanded of men in their situation." This verdict is certainly at variance with all the published accounts of the disaster.

April 3.—On the St. Louis and Southern Railroad, at French Village, a construction train ran into a passenger train. A number of passengers were scalded, and three were killed.

April 8.—The wall of a new building at Rochester, New York, on which a crowd was standing looking at the freshet in the Genesee River, gave way, and about thirty persons were drowned.

April 14.—Two cotton-mills at Chicopee, Massachusetts, were destroyed by fire. Six thousand bales of cotton were burned, the loss of property amounting to $500,000, and 800 persons were thrown out of employment.

April 19.—At Richmond Switch, Rhode Island, on the Providence and Stonington Railroad, the train connecting with the steamboat line from New York to Stonington was thrown into the river, the railroad bridge having been undermined through the breaking of a mill-dam above it. The engineer, fireman, and six others were killed, and about forty persons were wounded. There were about 130 persons on the train, and the number of lives lost is probably much larger than reported.

March 19.—The city of San Salvador has again vindicated the justice of its old Indian appellative, "Cuscatlan," the "land that swings like a hammock." Three successive earthquake shocks have absolutely destroyed the city. Only a single edifice—a large wooden building known as the College of Trent—is left standing. The only other buildings not completely leveled with the earth are the Government House and the Hotel del Parque, both built of stone, and two stories in height. Although the city contained a population of from 15,000 to 20,000, the citizens were so completely warned by the earlier shocks that the loss of life is estimated at less than 500, the lowest estimate being 50. A curious feature of the disaster was the exhumation of dead bodies from the cemeteries. The loss of property is estimated at from $12,000,000 to $20,000,000.

April 4.—An explosion of fire-damp in a coal mine near Abertillery, Monmouthshire, England. Five miners killed and many injured.

April 10.—A manufactory in Rome, Italy, destroyed by lightning. Five persons killed and seventeen wounded.

April 16.—Severe thunder-storm in Wales. Several persons killed by lightning.

OBITUARY.

March 27.—In Hartford, ex-Senator James Dixon, of Connecticut, aged fifty-eight.

March 28.—In Elkton, Maryland, John Thompson Mason, Secretary of State of Maryland.

March 31.—In Coscob, Connecticut, Charles W. Barras, dramatic author, aged forty-seven.—At Königstein, Saxony, Mrs. James Gordon Bennett.

April 8.—In New York, Alderman Peter Gilsey, aged sixty-two.

April 27.—In Washington, Commodore John H. Aulick, of the United States Navy, aged about eighty-four.

March 26.—In London, Count Arthur von Bernstorff, German minister to England, aged sixty-five.

March 27.—In Rome, the Countess Guiccioli (Madame De Boissy), nearly seventy years of age.—At Paris, Amédée Simon Dominique Thierry, the French historian, aged seventy-six.

April 11.—In Paris, Saint Marc Girardin, the eminent French writer, aged seventy-two.

April 18.—In Munich, Baron Justus Liebig, the chemist, aged seventy.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

THE summary of progress in our May number brought the subject up to about the 1st of March, where we resume it, and proceed to notice the comparatively few discoveries of interest that have since been made known.

Under the head of *Astronomy* nothing can be more startling than the announcement that the earth has actually passed through a portion of a comet without material influence upon terrestrial affairs. The researches of those who have studied the phenomena of meteors and of comets seem to have demonstrated that a shower of shooting-stars is the appearance put on by a comet's tail when the earth shoots through it, and that this periodically happens in the cases of Tempel's and of Biela's comets. Mr. Proctor has published some very plausible views as to the process by which comets and meteor streams have been originally formed within the solar system, in opposition to the theory that assigns the distant stellar systems as their birth-place. Thus he thinks Jupiter may have given rise to quite a number, and Uranus to at least one. The new star atlas, by Heis, is added to the list of original and valuable star charts. Among the important works relating to the motions of the planets of the solar system we notice the new determination, by Kruger, of the mass of the planet Jupiter, as deduced from its attraction of the asteroid Themis; and especially important in this department of astronomy will be esteemed the thorough investigation of the orbit of Uranus, with tables of his motions, now in press, from the pen of Professor Newcomb. Two new asteroids have been added to this group of planets, bringing the total number up to 130. The general activity in astronomical matters is shown by the proposed new building for the Cincinnati Observatory, by the assignment of an additional astronomer (Professor E. S. Holden) to the Naval Observatory, and, in France, by the complete reorganization of the corps of government astronomers.

In *Solar Physics* Secchi gives us his views of the nature of the solar spots and prominences, and deduces from theory, as well as from his own observation, the probable variability of the sun's diameter. The discussion of this matter by Faye, in several communications to the Paris Academy of Sciences, will serve to give precision to our views of this enigmatical subject. An instructive comparison has been made, showing that the work done by two thousand steam-engines, of one hundred horse-power each, and all working continuously for four thousand years, is only equal to the immense amount of force stored away in the sun's heat, and liberated in one minute's time on the earth's surface, in order to render it fit for habitation.

In *Terrestrial Magnetism* we note the interesting studies of Moncel, showing that the origin of many of the so-called ground currents is to be sought for in the apparatus itself; also the valuable contribution made by Professor Airy to our knowledge of the phenomena attending the great aurora of February 4, 1872, by the publication of theregisters of the self-recording ground current apparatus at Greenwich Observatory. The views held by Glaisher as to the relation of the auroral phenomena to the induced currents of terrestrial magnetic force have found an advocate in Professor Foster, of Zurich, and may be considered as entitled to at least as much weight as any that have yet been propounded in reference to the aurora.

In *Terrestrial Physics* the announcement made by the Coast Survey will be received with interest, that the self-registering tide-gauge in Penobscot Bay shows, by the fluctuations of the water surface, that on the 17th November, between midnight and 6 A.M., there were numerous decided earthquake waves. A severe earthquake shock is reported at Concord, New Hampshire, by Mr. Rockwood. The temperature of the interior of the earth (if that can be called the interior that is within a half mile of its surface) has been subjected to careful measurements by Dunker, who, from observation in an Artesian well 3900 feet deep, finds the rate of increase to be one degree (Fahrenheit) for every forty-seven feet of descent.

As for that which occurs above the earth, and within half a mile of its surface, we notice in *Meteorology* the study of Dove into the non-periodic changes of climate, as connected with the subject of corresponding and opposite climates in neighboring countries, such as Greenland and Iceland. A letter of Mr. Scott, of London, presents us with some of his views on the English system of storm warnings. The tables and charts of the annual rain-fall in Switzerland, and the similar work for the United States recently published by the Smithsonian Institution, give us some interesting points of comparison between the climates of these two republics. The exceptional character of the weather of the past winter has continued during the month of March, the Signal-office telegrams showing that at least ten distinct storms passed over the United States during that month.

One of these storms is among the most remarkable on record, and may properly be called the *Atlantic storm*, from the fact of its being the one in which the steam-ship *Atlantic* was wrecked, resulting in the loss of more than five hundred passengers. This was first noted on the coast of Oregon as a storm centre on the 26th of March (Wednesday). Passing over Dakota and Iowa, it was marked by a region of very low barometric pressure, and by Saturday it had passed Washington, and extended to New York, accompanied by tremendous rains and violent winds. On this day an area of a hundred miles in diameter in the State of New York exhibited a barometric depression to twenty-nine inches. During Sunday the storm centre developed in New England into absolutely unprecedented proportions, and on Monday morning passed out along the mouth of the St. Lawrence over the ocean, with a barometric pressure below 28.8, a record hitherto unparalleled. On Sunday afternoon the premonition of this storm reached the steamer *Atlantic*, and the barometer, falling almost as rapidly as in a cyclone, warned her captain to adopt the measure of turning her course toward Halifax, with its disastrous result.

Guthrie announces a very interesting relation

between electricity and heat, which may result in important applications hereafter. He finds that a heated object, especially if in connection with the earth at the time, has the power of discharging the electricity of an insulated electrical body when brought near to it, this power increasing with the intensity of the heat. Thus a point at a white heat will have an effect equally powerful with that of a body of much larger surface brought to only a dull red.

A paper by Meunier upon the outer crust of meteorites indorses the opinion to which we have already referred, that this is due to the mechanical action of the air through which the body has passed rather than to heat, and he calls attention to the fact of similar incrustations upon boulders long exposed to the atmosphere, especially in desert regions.

A movement has been set on foot for the renewal of the geological survey of the State of Pennsylvania, to be under the charge of Professor J. P. Lesley, of Philadelphia. This is proposed not only as a means of bringing to light important deposits of mineral wealth now unknown, but also for the purpose of securing a satisfactory and exhaustive representation of the subject in the approaching Centennial Exposition of 1876.

The note of preparation for *Explorations* in various parts of the world during the coming summer continues to be heard, and it is expected that, more than ever before, the different nations will exercise a friendly rivalry in this respect. In Africa we have already at work the Livingstone Congo Expedition, under Lieutenant Grandy, and that of Sir Bartle Frere, while a German Congo expedition is said to be nearly ready to start. Sir Samuel Baker, under the auspices of the Egyptian government, is also occupied in penetrating the interior of the continent, while General Purdy, it is said, will endeavor to join him by way of the east coast. Recent advices refer, we trust groundlessly, to reports of the massacre of Baker and his party by the natives. A Russian expedition is about to be fitted out for the exploration of Siberia. Nothing has been heard lately of the Swedish expedition to Spitzbergen, which, it will be remembered, was prematurely fastened in by the ice. This also detained a large number of persons belonging to a supply ship which was to return before the winter set in, and grave apprehensions are felt whether the limited supply of provisions on hand will subsist so numerous a body of men. Efforts were made by the steamer *Albert* and a sailing vessel to extend relief, but both were driven back by the severe weather and other difficulties. Mr. Rosenthal, an enterprising merchant of Bremen, it is understood, is about dispatching his steamer to repeat the effort to render help.

Nothing has been heard of Captain Hall since our last account, but it is hoped that in the course of the summer news will be received from him.

In America preparations are being made on a very large scale for explorations in the western part of the United States, at least three well-equipped parties being nearly ready to take the field. One of these, under Professor Hayden, will explore the main Rocky Mountains south of the 40th parallel; another, under Lieutenant Wheeler, probably divided into several branches, will continue the investigations already begun in Arizona, and will take up a new field in Colorado, and possibly in New Mexico. Major Powell, who has been engaged for several years in exploring the cañons of the Colorado River, has returned to that region for the purpose of finishing the uncompleted work.

The International Commission for the survey of the northern boundary of the United States has also renewed its operations, and will explore the line as far west of Pembina as possible. It is accompanied by Dr. Elliot Coues as surgeon and naturalist, and his well-known qualifications lead us to hope for many interesting scientific results.

Mr. William H. Dall, who, under the auspices of the Coast Survey, has been engaged in surveying the Aleutian Islands, resumes his labors in that quarter, and will visit the westernmost islands of the group in order to determine their availability as a landing station for a Pacific Ocean cable. Mr. Henry W. Elliott and Captain Bryant, on the Fur-Seal Islands, will also continue the natural history investigations which have already yielded such extensive results. Other parties, the details of which are not yet announced, will also be engaged in different parts of the United States.

As already stated, the United States naval expeditions for the survey of a canal route across Nicaragua and the Isthmus of Darien are still actively at work, although, so far, no very definite conclusions have been reached in addition to those obtained during the last year.

The British exploring ship, the *Challenger*, has been dredging and sounding in the Bay of Biscay and in the vicinity of Madeira during the winter, and has already made some very interesting discoveries. She was last heard of at Bermuda, and it is not improbable that her next move will be toward the coast of the United States.

The New York nautical school-ship *Mercury*, which last year made important observations in deep-sea temperatures, has continued these labors during the cruise of the past winter, having ascertained the temperature and other physical peculiarities of the ocean at several points. This vessel, commanded by Captain Giraud, has returned safely to New York, and a detailed report of operations may, doubtless, soon be expected from him.

Numerous announcements in the way of *Natural History* have been made within the last month or two, although embracing nothing of any particular importance. A paper by Dr. Haeckel on calcareous sponges is an important one both as a matter of zoological investigation and as a contribution to the general theory of evolution.

A specimen of the small Liberian hippopotamus, which weighs, when fully grown, only about 700 pounds, has lately been brought alive to England. It was obtained in the Scarcies River, in Western Africa, and having reached Liverpool in safety, was sent to the Dublin Zoological Garden, but unfortunately died in a few days after its arrival.

One of the most noteworthy facts in connection with natural history is the donation by Mr. Anderson, of New York, to the Cambridge Museum

of Comparative Zoology, of the island of Penikese,* in Buzzard's Bay, for the establishment of a summer school of zoology. Professor Agassiz has had an institution of this character in contemplation for some time, and had arranged to start it on Nantucket during the present season. But this donation from Mr. Anderson of an island worth $100,000, followed by the gift of $50,000 to meet the actual expenses, enables him to carry out his plan in the most permanent manner. No better place could have been selected on the coast of the United States for this purpose, and we have no doubt this will become a place of resort for naturalists superior even to what is expected from the zoological station at Naples founded by Dr. Antoine Dohrn.

In *Agriculture* the important announcement is made by Guerin-Ménéville of the decrease of the silk-worm disease in France, this being shown by the fact that unsound eggs have actually produced healthy worms. No new facts appear to have presented themselves in reference to the grape-vine louse disease, which has threatened to destroy the vineyards of France and other parts of Europe.

The enterprise of rearing ostriches in captivity for the sake of the feathers continues to be prosecuted, large farms and runs being laid out in South Africa for the culture of these valuable birds. A great increase in the supply of ostrich feathers has already taken place, with a corresponding reduction in their cost.

A French writer announces the existence of nitre in great quantity in the blite (*Amarantus blitum*), and suggests its cultivation on a large scale for the purpose of obtaining potash salts to serve as the basis of mineral manures.

A new page has been opened in the history of the American aborigines by a communication on the part of Professor Kerr in reference to mica mines in North Carolina. The occurrence of plates of mica in the Western mounds has long been known, but its probable source has hitherto been unexplained. Quite recently the mica regions of North Carolina have been found to abound in extensive excavations and tunnels made long prior to the settlement of the South by the white races, and in all probability these are the long-sought-for localities for the substance in question.

A lecture by Mr. Geikie upon the antiquity of man in Great Britain estimates his existence there to be at least as far back as 200,000 years, and during the glacial period. The detection of the remains of the *Lagomys*, or the Little Chief Hare, in the island of Corsica in association with human remains is believed to be indicative of the existence at one time of a subarctic climate in that island, during which it must have been inhabited by man.

Mr. Leon de Rosny has issued a call for the meeting of a council of Orientalists, to be held in Paris on the 10th of July next, and earnestly invites the co-operation of American scholars.

The subject of *Fish Culture* in America continues to receive much attention, the meeting of the Fish-culturists Association, held in New York in February last, giving evidence of great activity on their part. Numerous papers were read, and a great deal of important business was transacted. The experiment of transferring the eggs of white-fish to California, under the direction of the United States Commissioner of Fish and Fisheries, has at last proved to be a success. The first consignment of 200,000 perished, possibly from the inclemency of the weather. Of a second transmission, however, a large percentage of the eggs were hatched out, and are in good condition at the establishment of the State Commissioners at Clear Lake. These gentlemen have commissioned Mr. Livingston Stone to visit the East and obtain living fish of different kinds for stocking the waters of the State, among them black bass, eels, perch, white-fish, cat-fish, etc. The Central Pacific Railroad Company has placed a car at his command, and has also given him letters to all the connecting railway companies, which, it is hoped, will secure their ready co-operation. The car will be fitted out at Charlestown, New Hampshire, the seat of Mr. Stone's fish-breeding establishment; and he expects to carry with him, in addition to the fish named, a large number of young shad.

Preliminary steps for an important engineering enterprise have been taken by Congress in the appointment of a commission to examine and report upon the best method of irrigation in the valleys of certain rivers in California. Another Congressional movement was the appropriation of $100,000 for the institution of a series of experiments in reference to steam-boiler explosions.

The continued rise in the price of iron imparts great activity to its manufacture, the demand being far ahead of the possibility of a supply. This is due, in part, to the immense extension of engineering enterprises, in the way of building railroads, steamers, etc., and partly to the great rise in the price of coal in England, which has caused the stoppage of numerous establishments, and thrown the burden of manufacture upon a smaller number. It is likely, therefore, that every available means for increasing the product, in the way of searching out new localities of the ore, and the erection of new furnaces, will be employed.

A new heating and illuminating agent is announced in Great Britain. This is prepared by passing superheated steam through a heated mass of coke and iron, and consists of a mixture of hydrogen, carbonic oxide, and carbonic acid. As first made, it is without illuminating power, which, however, it acquires by passing through petroleum, by which twenty per cent. is taken up. It is yet a question, however, whether the new illuminator will stand the test of the condensation likely to be caused by cold weather, while, again, the existence of carbonic oxide as one of the ingredients of the gas is considered likely to produce serious effects in case of leakage.

The department of *Materia Medica* has been enlarged by the announcement of a new anæsthetic, in the form of methylene ether, which, in Dr. Richardson's opinion, possesses the valuable properties of chloroform without its inconveniences. The use of trimethylamine in acute articular rheumatism is strongly urged anew by an eminent French physician.

It is stated that the danger of mercurial poisoning in mineral factories may be measurably

* See map on page 4 of this number, where it is spelled *Penîguese*.

diminished by the evaporation, during the night, of the vapor of ammonia.

According to Dr. Fayrer, almost the only sure remedy for snake bite consists in tiding over a certain period of the disease by the application of artificial respiration. This has also been used to great advantage in several cases of apparent suffocation by the fumes of carbonic oxide gas. It has long been known as the final resort in treating persons apparently dead by drowning.

Among the miscellaneous announcements we have that of a gift of about twenty acres of valuable land by Mr. James Lick, of San Francisco, to the California Academy of Sciences, coupled with the condition, however, that the academy shall within three years erect a building thereon worth $150,000.

A bill has passed Congress authorizing the President to extend an invitation to the International Statistical Congress to hold its next meeting in the United States.

We regret to announce the death of Dr. John Torrey, of New York, the eminent botanist and chemist, as having occurred since our last summary. Other deaths announced are those of Mr. Jourdan, in France; Sir Frederick Madden, of the British Museum; and Mr. R. W. Thomson, the inventor of the steam road engine with India rubber wheel tires.

CONGRESSIONAL ACTION RESPECTING FORESTS.

A very important bill was lately introduced into Congress by Mr. Haldeman, of Pennsylvania, and has now become a law. It provides that every future sale of government land shall be with the condition that at least ten per cent. of the timbered land shall be kept perpetually as woodland; and if the land be not timbered, then the patent is to be issued on the condition that ten per cent. of the quantity is to be planted with forest trees within ten years, and kept forever as woodland. If this be done, an abatement of fifty per cent. is to be made on account of the expense of the planting. A violation of this agreement is to be met by the forfeiture of the land. It is also proposed that any one who may wish to acquire title to the public land, under the homestead act, can do so by proof of the fact that he has had, at the end of three years after taking possession, at least one acre under cultivation with timber for two years, and that this shall be continued until one acre in every ten is planted with trees, in clusters not more than sixteen feet apart.

GROUND CURRENTS AND THE AURORA OF 1872.

The journal of the London Society of Telegraph Engineers contains a very interesting summary of the phenomena of "ground currents," as observed in connection with the aurora of 1872, February 4. Not only was this aurora one of the most remarkable of recent years, because of the wide extent of its visibility, but it seems to have been attended with electrical disturbances that are, as yet, unparalleled in the annals of science for their intensity, if not for their duration and geographical extent. The above-mentioned journal gives a fac-simile of the automatic photographic records kept at the Royal Observatory, Greenwich, during the day of the aurora, and from this the exact nature of the electrical disturbance may be deduced. It appears that all the telegraph lines of the world were more or less affected on the day in question, and that all those running east and west, or nearly so, and especially the ocean cables, were rendered temporarily useless for business purposes from the disturbance caused by these extraneous currents of electricity, which are supposed to enter the line *via* the earth plate, or ground connection at each end of the line, and which either overpower or partially mask the effects produced by the current let on from a galvanic battery by the operator in the ordinary course of sending dispatches. The origin of the currents thus flowing through the telegraph wires or cables from one continent to the other is, so far, quite unknown, and though several hypotheses seem plausible, yet there are still wanting those accurate observations on which to base a correct explanation. The Greenwich records show the current to have produced effects similar to those resulting by a zinc current flowing from the east or northeast to the west or southwest.

The observations on the Red Sea cable showed the strongest current to have equaled that produced by one hundred and seventy Daniell's cells. On the Persian Gulf cable and the Atlantic cable the ground currents were equal to eighty Minotti cells. It would possibly be to the advantage of all concerned in telegraphy if systematic study on an extended scale of these earth currents could be instituted. The thorough understanding of the subject would doubtless lead to the invention of some method of ameliorating the disturbing effects of these currents on the business of the various companies.

PROTECTIVE FLUID OF CYMBEX.

According to Von Rossum, the larva of the genus *Cymbex* emits a colored fluid with great force through several apertures, for the purpose of protecting itself from the attacks of birds and other animals. This substance has been chemically investigated, and proves to be mainly an albuminoid compound, having much the reaction of white of egg. The coloring matter is supposed to be chlorophyl, or something similar to it.

PREHISTORIC SACRIFICIAL MOUND IN AUSTRIA.

Professor Woldrich gives an account of the discovery of a sacrificial mound in the vicinity of Pulkau, in Lower Austria, in which he succeeded in finding a great number of remains of animals that, in his opinion, had been sacrificed in some religious rites, possibly in connection with human victims, some remains of which were also discovered. Numerous implements were met with, some of them of stone, some of bronze, and others of bone and horn; pottery also was found, some of which was very tastefully ornamented. The principal animals observed were the peat dog, the peat ox (*Bos brachyceros*, ver.), and a larger species (*B. primigenius*); the goat, sheep, fallow deer, and stag.

The occurrence of the fallow deer among these remains is considered of great interest, as substantiating the assertion of Jeitteles that this animal was originally a native of Europe, and not, as generally supposed, introduced from an

Public Domain, Google-digitized / http://www.hathitrust.org/access_use#pd-google

adjoining continent. Specimens of the pig, of the horse, and of various birds were also found, but the latter were not distinguishable. The conclusion reached by Professor Woldrich was that the whole belonged to the bronze period, and that the epoch was one when stone implements were still used in connection with those of bronze.

DISTRIBUTION OF ATROPINE IN THE PLANT.

According to Lefort, atropine is more abundant in the leaves of the deadly nightshade before flowering than afterward, so that they should be collected for manufacturing purposes between flowering and fruitage. The quantity in the roots varies very greatly, the young roots yielding more than roots of two or three years old, because the latter contain a smaller proportion of bark.

INJURIOUS EMANATIONS FROM MANUFACTORIES.

The necessity of legislative action for the protection of the health of the community in the vicinity of certain manufacturing establishments is shown by the experiences with the Freiberg lead-smelting works. All vegetation has been destroyed in the vicinity, and a pine forest at a distance of four miles has been considerably injured. Cattle feeding on the fodder of the district experience peculiar attacks of sickness. Analysis of the affected plants exhibits traces of arsenic and lead, and an abnormal quantity of sulphuric acid. In view of the variety of substances involved in the supposed agencies, experiments were made to determine to which the result was especially to be ascribed, and it was found that arsenic was not at all injurious, successive fumigations of arsenious vapor producing no effect on the trees; nor was vegetation destroyed in the neighborhood of arsenic factories. When arsenic was applied in solution to the roots of plants it was found to be more prejudicial. In continuing the experiment, finely powdered lead carbonate was applied from time to time for one year to a young fir. During that year there was no growth; but the next season it proved to be healthy and vigorous. The most destructive results were found to be due to sulphurous oxide. Five fumigations, with air impregnated with $\frac{1}{18000}$ of this gas in volume, caused all the leaves to fall, and killed the upper part of the tree. A still more excessive dilution produced similar evils, but required a longer time. Trees fumigated for a period of three months were killed, even when treated with a mixture of one-millionth of the gas by volume, the moist trees being first affected. Soot appeared to have no injurious effects; benzine was burned under a case surrounding a young fir till the tree became quite black; but the tree produced its annual shoots notwithstanding, and remained quite healthy.

The general result is that sulphurous oxide is the especially poisonous ingredient of the smoke from smelting-works. A curious fact has been noticed in Germany in reference to the action of sulphurous oxide—namely, that an atmosphere of $\frac{1}{33000}$ of sulphurous oxide destroys the chlorophyl grains in wheat, oats, and pease in a few hours; but, curiously enough, a proportion of one in 74,000 produces no injury. Cabbages, and all plants having large, strong leaves, appear to be but slightly affected. Wood smoke does not injure vegetation; but that of coal and of some kinds of turf is very prejudicial, owing to the sulphurous oxide produced in combustion.

RAIN-FALL IN THE UNITED STATES.

The extensive work on the rain-fall in the United States, lately published by the Smithsonian Institution, will be invaluable to engineers and others to whom are referred the great questions of improving the navigation of the rivers of this country. By means of such tables as are given in this volume a few minutes' computation enables one to determine the area of country that must be drained in order to secure a water supply sufficient for any specified purpose. The engineers of Europe have long been sensible of the great practical value of works of this nature, and we have before us a chart of the rain-fall of Switzerland, showing, by carefully drawn isohyetals, the minutest detail of the annual precipitation (including the melted snow of winter). The construction of this chart, which is probably preliminary to a far more elaborate exhibit, is based on the returns during the six years 1864–1869, from the ninety-seven stations of the Switzerland hydrometric commission of the "Naturforschenden" Society. A comparison of the data for some of the Swiss lakes with those for the great lakes of America may prove of interest. Thus we have the annual rain-fall for Lake Geneva, 39.4 inches; for Lake Neuchatel, 37.4; for Lake Zurich, 46.2; for the Boden-See, 43.3 inches. On the other hand, we find from the Smithsonian charts, for Lake Ontario, 32; for Lake Erie, 38; for Lake Huron, 30; Lake Michigan, 30; Lake Superior, 28 inches; and for Salt Lake, Utah, 20 inches.

The ratio of rain-fall to evaporation, and the resulting volume of water flowing into the rivers, are among the most interesting of the questions that come before hydraulic engineers. Mr. Benteli, the author of the Switzerland rain chart, has studied the subject, and finds that in the area drained by the Aar only eighteen per cent. of the rain-fall is lost by evaporation; the remainder flows into the river past the city of Aarau.

The neighborhood of the Grimsel, and of Mount St. Bernard, is the region of the heaviest rain and snow fall in all Europe, the annual fall being measured as 98.4 inches. The Smithsonian rain charts give 80 inches for the extreme northwest coast of Washington Territory, and 60 inches for Southern Florida, as the points of heaviest rain-fall within the United States.

THERAPEUTIC QUALITIES OF HYOSCYAMUS.

In an article by M. Oulmont upon the therapeutical action of hyoscyamine in convulsive and spasmodic affections, being a continuation of a former paper by him, published two years since, on the physiological action of this substance, the following conclusions are presented: 1. Hyoscyamine represents all the active principles of henbane, and the fixity of its composition allows its being employed with a precision that is not attainable with henbane in substance. 2. It should be given at first in small doses (two milligrams per diem), whether in the form of pills or hypodermic injections, but the dose may ultimately be increased to ten or even twelve milligrams per diem. 3. It should be contin-

ued even after the supervention of slight symptoms of intoxication (as dryness of the throat, and dilatation of the pupils); but if these become more serious, and cerebral symptoms are produced, it should be suspended. Such symptoms, however, soon disappear. 4. Its action is narcotic, and it is efficacious against pain, and especially in neuralgia, but its efficacy is less marked than that of opium and belladonna. 5. It exerts a favorable action in spasmodic and convulsive neurosis. It has cured mercurial tremor when all other means have failed, and in senile trembling and *paralysis agitans* it has produced an amelioration procurable by no other means. 6. In *locomotor ataxy* it is of no use, but in *traumatic tetanus* it has produced an amount of relief that encourages further trial.

CURE FOR CATARRH.

Although a catarrh of itself is not to be classed with the dangerous diseases, it is always troublesome, and if the bronchiæ become affected a favorable termination, especially with aged persons, is not always certain. A remedy for this affection, as suggested by Dr. Hagar, is as follows: Five parts of carbolic acid, six of aqua ammoniæ (specific gravity 0.960), ten of distilled water, and fifteen of alcohol are to be mixed together in a wide-mouthed bottle, half filled with cotton or asbestus, and snuffed up from time to time from the bottle. After a thorough trial of this prescription Dr. Brand states that it shortens the first stage of the disease, prevents the second, and alleviates all the symptoms. He prefers, however, to apply it by inhalation through the mouth as well as the nose, by pouring a few drops on porous paper, and holding it in the hollow of the hand before the face, with the eyes closed.

EXPLOSIVENESS OF WET GUN-COTTON.

The discovery by Professor Abell, of the Woolwich Observatory, made several years ago, that compressed gun-cotton fired by means of a detonating fuse exercised an extraordinary shattering power upon objects with which it was in contact, has been applied to a great many practical purposes, in consequence of the facility of manipulation. One special advantage claimed was the fact that the same cotton, when ignited by an ordinary match, would burn scarcely more rapidly than ordinary cotton, and with no explosive action. Several instances of disaster, however, have lately occurred in preparing and using this material, which tend to show that it is not quite so safe to handle as was originally anticipated.

Recent discoveries at Woolwich have somewhat restored confidence in this substance. Mr. E. O. Brown, of the arsenal, has found that compressed gun-cotton containing fifteen to twenty per cent. of water, and, consequently, incombustible under ordinary circumstances, can be exploded by detonating fuses almost as well as if perfectly dry, and it may be kept quite damp for an indefinite period of time without affecting its utility. In the course of his experiments Mr. Brown placed disks of wet compressed gun-cotton upon a slab of iron an inch thick, without any covering, and on exploding them the iron was found deeply indented. A solid tamping of sand was then laid over the disks, and after the explosion the iron was shattered to fragments. By this new discovery the cotton may be kept wet in cylinders, and will be absolutely free from any dangerous results should it be exposed to any agency other than that of a percussion-cap or a detonating fuse.

METEORIC SHOWER OF NOVEMBER 27, 1872.

The scientific journals of Europe contain copious accounts of the great meteoric shower on the evening of November 27, only the end of which was seen in this country. Professor Bruhns writes that at the Leipsic observatory seven hundred meteors fell, in the south and southeast, in the course of thirty-five minutes. Between eight and nine o'clock an observer, looking north, counted at the rate of twenty per minute. About one out of six was as bright as a star of the first magnitude, and most of the remainder were between the second and third, only about one-third of the whole being fainter than the third magnitude. The brighter ones were generally yellow, though sometimes green.

The accounts from France and from all parts of Germany are of the same general nature, but it seems that in Italy—owing, perhaps, to the clearer sky—the phenomenon appeared to better advantage. At the observatory of Moncalieri thirty-three thousand meteors were counted in six hours, showing the shower to have been one of the most remarkable of recent times.

RAIN-GAUGE AT SEA.

The apparatus used for the determination of the amount of rain-fall on land is not adapted for use upon the sea, but an arrangement has recently been devised by which the rain-gauge is hung like a ship's compass in its gimbals; an open mouth is thus always directed toward the sky. In this way it is hoped that much valuable information will be obtained which will have an important bearing on the discussion of the subject of general climatology. It is probable that hereafter such gauges will constitute a part of the equipment of every vessel fitted out for scientific purposes.

THE SEQUOIAS OF CALIFORNIA, AND THEIR HISTORY.

Dr. Gray's address before the American Association at its last meeting, recently republished with supplementary notes and appendix, discusses certain scientific questions suggested by a visit to the "Big Trees" of California. More remarkable than either the size or age of these trees (and none of them is over two thousand years old) is their *isolation*. The only existing species of the genus are restricted to limited portions of California, one to the Coast Range, the other yet more narrowly to a few spots in the Sierras. Were they created thus isolated both systematically and geographically? are they destined to a more extended range? or are they but the scanty remnants of a race now almost extinct? The first suppositions are shown to be as improbable as unscientific. The third forms the main subject of the address.

The only near relatives of the red-woods are our Southern cypress, ranging from Maryland to Mexico, and the Glyptostrobus, which is found in China. Yet geology teaches that in the tertiary period these families were not thus separated, but that the cypress, several Sequoias, and a

Public Domain, Google-digitized / http://www.hathitrust.org/access_use#pd-google

Glyptostrobus existed together in Europe. To show the connection of these facts, a comparison is made of the present floras of the three regions, Eastern and Western America and Northeastern Asia. It is found that while there is very great dissimilarity between the characteristic forms of the Atlantic States and California, there is as remarkable a likeness between the vegetation of the same States and Eastern Asia. Various instances are cited of plants of very limited range in the Atlantic States, which occur again, the same or nearly so, in Japan or Eastern Asia, and nowhere else. And of all the numerous species which are common to these regions, either identical or with slight differences, only one-third are also found on the intermediate Pacific slope of America, and of the corresponding genera less than one-fourth.

Now the only known cause of resemblance is inheritance (always attended with some difference, especially under changed conditions), and the supposition of a common remote ancestry is the readiest method of explaining these similarities in so remote floras. In a discussion of this subject in 1859, Dr. Gray considered this ancestral vegetation as occupying in the pliocene, or a still earlier period, the then temperate high northern regions of the earth. The glacial period which followed, extending southward, drove this vegetation gradually before it, while the differences of climate which marked, then as now, different longitudes determined the survival or destruction of species and the degrees of difference in resultant forms. Under varying or similar conditions species became modified in the same or different directions.

Recent geological discoveries, which establish the antiquity of present species, have confirmed this view. The cypress has been found fossil not only in the miocene of Europe, but also of Spitzbergen, Greenland, and Alaska. Remains of at least three species of Sequoia, closely allied to our own, exist abundantly in the same formation, showing that these and kindred species were once prevalent throughout the arctic regions, and extended southward into Central Europe and our own Rocky Mountains. The Chinese Glyptostrobus and the Gingko, now confined to Japan, had their near representatives occupying a like wide range. The Libocedrus of California was, with the Sequoias, in Spitzbergen; and the oaks and other common trees of the Atlantic States had numerous and close representatives in the flora of polar latitudes. And these same forms may be traced yet farther back into the cretaceous period.

The conclusion reached is that the facts justify the opinion that the essential types of our actual flora are marked in the cretaceous period, and have come to us through the tertiary without notable change; that the present existing species are the lineal descendants of the ancient ones; that the adaptation of vegetable life to successive times and changed conditions has been maintained not by absolute recreations, but by gradual modifications; that "order and exquisite adaptation did not wait for man's coming, nor were they ever stereotyped." An earnest protest follows against the thought that such conclusions should have an irreligious tendency. As Christian faith outlived, unharmed, the notion of the fixity of the earth, so will it the idea of the absolute fixity of the species inhabiting it, and "in the future, even more than in the past, faith in an *order*, which is the basis of science, will not—as it can not reasonably—be dissevered from faith in an *ordainer*, which is the basis of religion."

DO FLIES EAT POLLEN?

The question has sometimes arisen as to whether flies actually eat the pollen of plants, or simply carry it away on their legs and backs. Mr. A. W. Bennett, however, reports the result of examinations prosecuted by himself of the stomachs of various diptera, which were found to contain large quantities of pollen grain, showing that it must have been actually consumed. In reply to the query as to the possibility of insects which are organized for sucking devouring such solid bodies as the pollen grains, it is answered by Müller that the transverse denticulations found in the valves at the end of the proboscis of many diptera are especially adapted for chewing the pollen grains, and for dividing the threads by which these grains are often bound together.

DISCOVERY OF THALLENE AND OTHER SOLID HYDROCARBONS.

Professor Henry Morton, in a communication to the *American Chemist*, calls attention to a solid hydrocarbon lately discovered by him, and which he names *Thallene*. In the previous investigations of certain tarry matters left in the bottom of the still in distilling petroleum for the manufacture of illuminating oils, he also succeeded in extracting a solid crystalline body of a yellow-green color, and of remarkable fluorescence, which he described under the name of *Viridin*. This was very remarkable for the peculiar spectrum which its fluorescent light yielded, resembling in a striking manner that of anthracene, although the crystalline form, solubilities, and fusing points of the two bodies were decidedly unlike. He subsequently succeeded in separating another species from Viridin besides the Thallene in question. The paper referred to contains a very copious account, accompanied by diagrams of the peculiar phenomena of these chemical novelties.

FICHTELITE.

Professor Mallet, of the University of Virginia, has lately examined certain colorless crystalline crusts found in the cracks between the annual rings of growth of a log of long-leafed pine (*Pinus australis*), and has come to the conclusion that in all respects they are identical with the *fichtelite*, a hydrocarbon hitherto only known in a fossil state.

RATE OF INCREASE OF HEAT IN PENETRATING THE EARTH.

A new determination of the rate of increase of heat as we descend into the earth has been lately made by Dunker, and the care with which the experiments were conducted gives much value to his results. The observations were made in an Artesian well in Sperenberg, Germany, having a depth of about 3900 feet. The well being supplied with water from several springs, it was necessary to avoid the disturbing influence upon the temperature of the circulating water; and,

Public Domain, Google-digitized / http://www.hathitrust.org/access_use#pd-google

in order best to secure this end, a small hole was bored at the bottom of the larger bore of the well. This smaller hole was about twenty feet deep; the self-recording thermometer was placed in it, and the entrance firmly closed. The average of two determinations made in this way gave, after correcting for all known sources of error, 37.24° Réaumur, or 115.79° Fahrenheit, as the temperature of the strata at the depth of the small hole. The measures at lesser depths were taken with equal care (by effectually stopping, temporarily, the water circulation), and they show that the rate of increase was not uniform, being on the average one degree Centigrade for 27.8 meters of descent, or one degree Fahrenheit for forty-seven feet.

SIGNS OF DEATH.

Dr. Hugo Magnus, assistant physician to the hospital at Breslau, suggests that the tying of a tight ligature around one of the fingers will determine whether a person supposed to be dead is so in reality. If life be not extinct the extremity of the finger soon becomes red, the depth of the color increasing to dark red and violet, while the skin above the ligature remains white. This is easily understood, as, if there be any circulation of the blood, the ligature prevents the return of the venous blood, while the arteries still continue to convey it to the capillaries. A test so simple can be applied without difficulty, and seems to be quite decisive.

PREPARATION OF KOUMISS FROM CONDENSED MILK.

According to Carl Schwalke, this is accomplished by dissolving six cubic inches of condensed milk in a little cold water, to which add fifteen grains of lactic acid, eight grains of citric acid dissolved in water, two hundred and twenty-five grains of rum, and dilute with water to from one to two quarts. Put the mixture in a Liebig's bottle, impregnate with carbonic acid, and place it in a warm room. If in from two to four days it is sparkling, and fermentation has commenced, it is in good condition, and will remain so for about a week.

ACTION OF OZONE ON VULCANIZED RUBBER.

Mr. Wright, in the *American Journal of Science*, refers to the action of ozone upon vulcanized rubber, his attention having been called to it by the fact that the ebonite insulators of Holtz's electro-machine became unusually hygroscopic soon after the instruments had been used, with the attendant production of ozone—to such an extent, indeed, that the liquid sometimes trickled down in drops. Examination showed that this contained a considerable amount of free sulphuric acid, which was supposed to result from the action of ozone upon the sulphur of the India rubber.

EXCRETION OF CARBONIC ACID FROM THE SKIN.

Careful observations have been made by Dr. Aubert in reference to the amount of carbonic acid excreted by the skin in man. For this purpose the subject was placed in a close box accurately adapted to the neck, and having tubes connected with it for the entrance and exit of the air, the tubes being, of course, again connected with apparatus for the analysis of the air, thus containing the products of the cutaneous respiration. The general result arrived at was that, in the course of twenty-four hours, the maximum amount of carbonic acid exhaled was about 97 grains, and the minimum about 35½, thus making a mean of 59.7 grains of carbonic acid as eliminated from the whole surface of the body below the neck. This, of course, is independent of the quantity exhaled from the lungs. Making proper allowance for the head, in addition, the entire quantity may be reckoned at about 60 grains per diem. During the same time, however, the quantity thrown out by the lungs amounted to 13,500 grains; so that the percentage exhaled by the skin is very trifling. The quantity of acid eliminated increased with the increase of the temperature to which the subject was exposed.

ANTIQUITY OF MAN IN BRITAIN.

Mr. Geikie, director of the Geological Survey of Ireland, in a lecture recently delivered upon the antiquity of man in Britain, calls attention to the differences between the paleolithic and neolithic stone periods of that country, marked by the occurrence of rude stone implements in the former, and polished ones in the latter. He estimates a wide interval of time between these two periods, the paleolithic being characterized by the occurrence of the implements referred to in caves and in river gravels, associated with the remains of animals which are now either extinct or which have retreated far to the north, and are only to be found in an arctic climate—the former including the cave bear, the Irish deer, several species of rhinoceros, elephant, etc.; the latter the reindeer, the glutton, and the musk-ox.

He concludes that paleolithic man must have entered on the stage ages before the valleys of the south of England were hollowed out to their present depth, that during his long occupation the rivers succeeded in cutting out these valleys, and that not until after this was effected did paleolithic man disappear and neolithic man take his place, no neolithic remains occurring in the ancient river gravels.

Mr. Geikie then inquires into the nature of this break, and the causes which produced the simultaneous disappearance of paleolithic man and the old pachyderms, and the subsequent introduction of neolithic man and the animals of an almost totally different form. This he explains by the intervention of the glacial epoch, and concludes that during the paleolithic period man experienced two kinds of climate, one almost arctic, the other mild and genial, the two represented by the preglacial and interglacial periods.

After the unknown period of time in which the last glacial changes were completed and the surface of the land was again exposed, neolithic man made his appearance. Mr. Croll estimates the commencement of the glacial epoch as being at least 240,000 years ago, and the period itself as lasting for 1600 centuries. If man be of preglacial age, his antiquity in Britain is therefore fully 200,000 years.

While Great Britain was still joined to the Continent neolithic man and his associated animals made their appearance (the winters being severe enough to freeze over the rivers in the

south of England), coming in from the east and south, or from regions whence they had been previously displaced by these climatological changes. However the intervals indicated may have been bridged over for them elsewhere, Mr. Geikie is quite satisfied that they were entirely absent from Great Britain for a very long period of years.

TREATMENT OF INTERMITTENT FEVER BY CARBOLIC ACID.

Dr. Déclat announces to the Academy of Sciences of Paris a new method of treatment of intermittent fever, the success of which has been tested upon cases conducted in France, Hungary, Algeria, Senegal, India, etc., and which, after a few days of trial, sometimes with a single application, has succeeded in causing the disappearance of the fever. The advantages of the treatment are that it may be applied at any time, and that there are no counter-indications on the part of the nervous system, the intestinal apparatus, etc. The brain and the stomach, so frequently affected by the use of quinine, are not interfered with by the new medicine.

The method in question consists in the hypodermic injection of carbolic acid, introduced under the skin of the chest, the belly, the inside of the thighs, etc. The first day of the treatment four injections are to be used of one hundred drops of carbolic acid of one per cent., the next day three injections, and the day after two.

The author states that the first operation always diminishes the fever, and frequently cures it entirely; the second is sometimes merely a precautionary measure, and the third is even less necessary. As an additional precaution in some cases, especially if there are indications of cachexy and decided visceral engorgement, Dr. Déclat prescribes the use every day of twenty to twenty-five centigrammes of pure carbolic acid, either in sweetened water or in the form of a special sirup.

EXPLOSIVE ANTIMONY.

Antimony is precipitated from its solution in hydrochloric acid on copper foil attached to the negative pole of a battery (the positive being platinum foil) as a brittle, lustrous film, which, after being washed with distilled water, scales off on bending the copper foil, and by friction or percussion can be made to explode, with the evolution of light and heat, on account of its sudden passage from the ductile, homogeneous, amorphous condition to the crystalline.

FOUR HUNDREDTH ANNIVERSARY OF THE BIRTH OF COPERNICUS.

The original manuscript of the great work, *De Revolutionibus Orbium Cœlestium*, of the immortal Pole, Copernicus, has been safely preserved in Prague for three hundred years, and is now being published as a part of the collection of writings issued to commemorate the fourth centennial anniversary of his birth. It will be remembered that this most interesting work, which has virtually been the foundation of modern astronomy, was originally printed during the latter years of his life, but not altogether under the personal supervision of the author, and was immediately proscribed by the Romish Church, so that few if any copies of the original edition are now extant. The numerous subsequent editions have given the original text in a more or less mutilated state, and it is a welcome contribution to astronomical literature that we are now to have a faithful copy of the work as it still exists in the own handwriting of Copernicus. This book will form one of the four subdivisions of the *Spicilegium Copernicanum*, the other divisions being composed of the lesser works, correspondence, etc., of the great astronomer. The original manuscript of the *De Revolutionibus* forms a volume of 217 leaves of small folio, one foot high and eight inches broad, quite clearly written, in uniform small letters, with black ink, the titles and initials of the separate books and chapters being colored red. It has been in the possession of the Nostitz family since the year 1600.

AMOUNT OF FORCE DERIVED BY THE EARTH FROM THE SUN'S HEAT.

An interesting computation has been made of the amount of force imparted to the earth by the sun's heat. According to the best investigations that have been made, there is received in one minute enough heat to raise the temperature of five and a half cubic miles of water one degree Centigrade. If, now, we compare this with the work done by a given amount of heat, as utilized in a steam-engine, it will be found that the heat sent to the earth in the sun's rays during the space of one minute is able to do as much work as would be done by two thousand steam-engines of one hundred horse-power each, working continuously for the space of four thousand years.

What becomes of this inconceivably great amount of power is worthy of consideration; and we begin to realize the nature of the problems of the future scientists when we reflect that by far the larger part of this heat force expends itself upon the earth in actual work, only a small portion of it being radiated into space. Of course the result accomplished, such as the maintenance of the temperature of the earth, ocean, and atmosphere, the stimulating of animal and vegetable life, etc., etc., must be the equivalent of the power retained by our globe.

EXHALATION OF MOISTURE BY PLANTS.

Dr. Deitrich, the superintendent of the experimental station near Cassel, communicates the following results of experiments to determine the amount of moisture exhaled by plants: First, for the same species of plant the amount of vegetable matter produced is in direct proportion to the amount of water given off; second, the amount of nutritive matter taken up is also related to the amount of water exhaled; third, the amount of moisture exhaled varies with different species of plants. According to the amounts exhaled, the experiment establishes the following order: buckwheat, clover; then lupines, beans, and oats equal; summer rye and wheat equal; and last, barley.

YELLOW COLOR OF SILK.

Pfeiffer informs us that the yellow color of silk is a more or less altered chlorophyl, which has been deprived of its blue color. He succeeded in extracting uncolored chlorophyl from the raw silk, which, when heated with ether containing hydrochloric acid, could be again divided into the blue and yellow constituents.

Editor's Drawer.

OUR LONDON SCRAP-BOOK.

THE HAYMARKET.

DEATH (A LA WATTEAU).

THERE is no hay sold in the Haymarket; but, indulging in a grim conceit, one might say that the old name has been appropriately retained, although all signs of the original commerce have disappeared. For "all flesh is grass," and here nightly poor withered humanity, once fresh and beautiful as the verdure of the meadows, is offered for sale, bargained for, and bought. The Haymarket is a subject upon which English writers are wonderfully reticent. Even when the town happens to be their theme, it is passed over with the slightest comment. The savage vice of the East End, indeed, is regarded as supplying scenes horribly picturesque. But the haunts of the wealthy and fashionable depravity-hunters obtain covert allusion in lieu of graphic description. It would hurt the proper pride of a Londoner, who may have dwelt upbraidingly on the condition of Paris, to admit the existence in the very centre of London of scenes as deplorable as any to be discovered in the French capital.

The Haymarket is a short but spacious thoroughfare, touching at one end Pall Mall, and at the other abutting upon Tichborne Street. In the daytime it appears to be a sufficiently dull and respectable street. It offers but few temptations to pencil or pen. The Civil Service Stores —the particular horror of tradesmen—stand here, and carriages arrive at and leave the doors every minute. Even what are popularly known as "swells" do not object to purchase goods at a few pence under the current retail prices, though coupled with the disadvantages of "no credit" and no goods sent out. One likes to see a lady in gorgeous attire and blaze of jewelry taking home a pot of marmalade or a jar of pickles in her own carriage, and it is quite comforting to reflect that she has saved at least twopence by the transaction. Here one or two celebrated picture-dealers and print-sellers have handsome shops, the windows of which offer an unfailing attraction; and an old bookseller, whose plate glass stands sadly in need of cleaning, exhibits some wonderful old black-letter volumes for the delectation of those who enjoy the perusal of such curiosities above all other descriptions of reading. Here, too, stands the Theatre Royal, where the old theatre stood. Little Mr. Pepys, of the *Diary* celebrity, attended that temple of the drama, and was particularly pleased when his gallant and moral sovereign, Charles II., happened to occupy the royal box. On such occasions it is to be feared he allowed his loyalty to get the better of his literary tastes, and permitted his eyes to rest more often upon the box than upon the stage. Was it not at that theatre that he heard the wonderful "wind-musique" sung by the angels in Massinger's *Virgin Martyr* (a play of which the chatty little critic didn't "think much")? And has he not left it upon record that the said "musique" was so sweet that "it ravished me so that it made me really sick, just as I have formerly been when in love with my wife?" Little did Mrs. Pepys, who dutifully sat beside her husband in the pit, know of the unconjugal reflection passing through the mind of her lord and master. In the present theatre Mr. Buckstone—a relic of the old school—has amused two generations of play-goers, and seems likely to entertain a third, although he has grown deaf in the service of his patrons. Here, too, Mr. Sothern's Lord Dundreary became the rage, making *Our American Cousin* the talk of the town for three years. Nearly opposite the theatre stands her Majesty's Opera-house, with its quaint bass-reliefs. This house was burned to the ground about six years ago, but was immediately rebuilt. Owing to some difficulty raised (it is understood by Earl Dudley, who is one of the proprietors) the new building has not been opened for performance, her Majesty's opera company appearing on the Drury Lane stage in the mean time. In the quiet by-streets are favorite stands of exhibitors of performing mice and performing canaries. A natural philosopher with one eye occasionally exhibits razor-paste for sale. The paste is most decidedly not worth the penny which the vendor demands, but his oration in praise of the discovery is worth that coin twelve times told.

But it is the night side of the Haymarket which has given the neighborhood its peculiar notoriety. When the lamps are lit, and the moonlight plays fantastic tricks among the carved figures on the Opera-house; when the print shops are closed, and the shutters up at the Civil Service Stores; when the canary man has gone,

and the proprietor of the mice is at home educating new performers; when the natural philosopher—long ago retreated—is perchance following up some discovery that may restore sight to his disabled optic; when bars and supper-rooms and cafés throw out floods of light upon the pavement, crowded with sauntering figures; when the air is heavy with cigar smoke and filled with the *rustle-rustle* of stiff silks—then the Haymarket *is* the Haymarket. Our ancestors had a rough and healthy method of dealing with these subjects, which has not descended to our less vigorous period. They dashed boldly *in medias res*. They called spades spades. In the practice of morality they were not a whit behind their descendants. But they must surely have blushed less, because, not making a habit of concealment, they experienced no shock at accidental disclosures. I believe, nevertheless, that if Ben Jonson were alive now, and were to give a dramatic presentation of the Haymarket (which in his time was a field surrounded with hedges), we would hoot him. Or if that later satirist, Hogarth, were among us to paint a new series of the "Harlot's Progress," we would call him rude.

A HEREDITARY LEGISLATOR—LORD R——.

It is permitted to us to tread this pavement, but we must keep our eyes shut to a good deal that transpires. What we see we may report—but not overminutely; and as for comment, we had better omit any. So, understanding our duty, we wander through the crowd. It is nearly midnight. A considerable stream is pouring into the Haymarket from Great Windmill Street, in which thoroughfare is situated a large dancing-saloon known as the Argyle Rooms, and licensed by an act of George III. Observe how many of these leaders of the demi-monde drive away in their own private broughams. Note the monograms on the panels and the neat liveries of driver and footman. A crowd clusters round the entrance of this licensed establishment to watch the departing ladies, some of its number feeling flattered if they should receive from one of them a nod of recognition, a tap of the fan, a friendly wink. The attendant policeman finds it difficult to keep the roadway clear. Like Fastidius Brisk, in *Every Man out of his Humor*, he "swears tersely and with variety." But his efforts are ineffectual. Till the last brougham has driven away, till the last anonyma unattended has tripped off, till the lights are turned out, the little crowd stands staring intently as if some very meritorious action were being performed. But it flashes across one's mind that just such a little crowd will gather round a corpse, or hang about the door of a house where murder has been done. Remembering which, one shudders and turns away. And from what class of society are the incomes drawn to pay for these broughams, for these jewels, for these dresses? From every class. It is openly visited—this haunt—by men of wealth and of what is popularly denominated "spotless reputation." That big burly man with the florid complexion is Sir —— ——, a celebrated city banker. He spent the early part of the evening behind the scenes at one of the theatres. He is finishing up the night here. That evil-visaged and elderly person with his hair brushed over his temples might have been a coster-monger, but is in reality a lord. He has been mixed up in a variety of shady transactions, the most notorious being that of the famous "Restorer of Youth," who has been recently liberated from Newgate. On each arm hangs a girl smoking a cigarette. The combined ages of his protégées

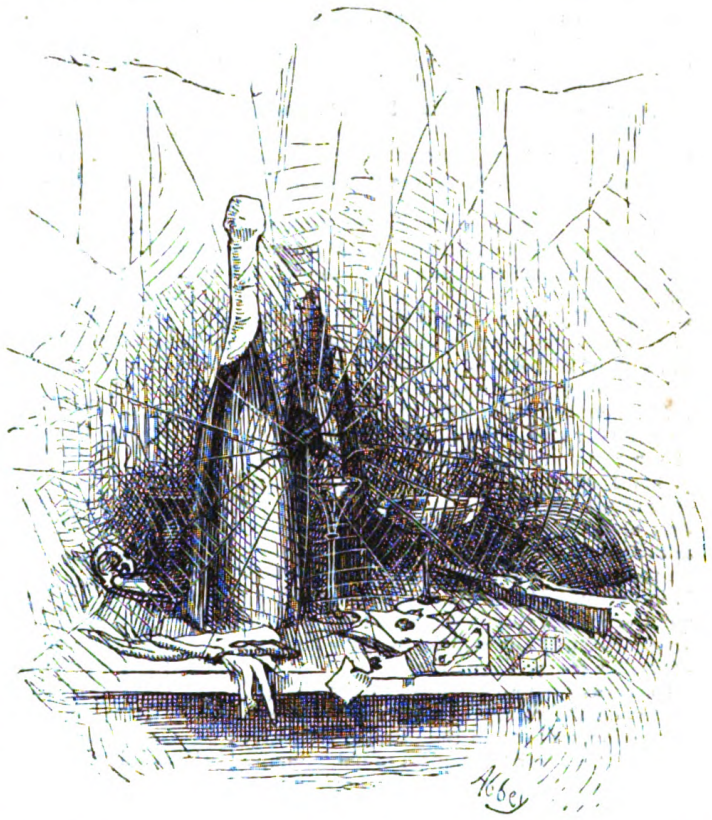
ANONYMA.

would not reach his own by ten years. To-night he patrols the Haymarket; to-morrow night he will be making laws for the government of Britain. He is one of our hereditary legislators. Yonder go a couple of Foreign-Office clerks, members of a staff noted as being the best-dressed and most empty-headed in London. The number of old men to be found here always excites astonishment. How their white heads—in a few years to be laid under the sod—contrast with the flaxen or auburn or black tresses of their companions! but how well harmonized are their senile mumblings with the hard, hollow, ringing laugh of the dames! The laugh heard here is the most dismal cachinnation ever uttered. It reminds one of Swinburne's line—

"Laughter
Heard far down in hell."

In this revel of Circe strange characters meet. Billiard-markers jostle marquises. Clerks smoke cigars under the noses of merchants. And as the crowd slowly passes up and down in two unceasing streams, the buzz of conversation surges, the hollow laugh is repeated; all is motion and gayety and abandon. "Let us be merry, for—to-morrow we die!"

But sad as this picture is, there are not wanting touches which will make it sadder still. What is the end of all this rustle of silk, and rattle of carriages, and glitter of gold, and pleasing attentions of adolescent or senile members of the aristocracy? While the eye rests on the beauty and the wealth, it is hard to believe that in nine cases out of ten that



"ANY WHERE, ANY WHERE, OUT OF THE WORLD."

end is the hospital, or the prison, or the Thames. But an observant eye will catch some indications of the fate which hangs suspended over the gay rabble: a figure suddenly stopping on the footway, the painted cheek turning pallid, the hand suddenly pressed to the side, the eyes closed in agony, the faint moan lost in the surrounding chorus; or a fair young form hauled off to the police station, resistful and blasphemous; or the sudden appeal of one with pinched face and eager eyes, who informs you that she is "down on her luck," that she hasn't "tasted food since eight this morning," and implores relief. These are the incidental strokes which complete the picture. These are the figures which Hogarth would throw into his foreground. Such instances encountered *en passant* must give great zest to the forced gayety of those who are not sick, or hungry, or in distress —*yet*. There is scarcely one of these women, how gay or "lucky" soever, that does not hate the life like poison—that would not embrace any decent opportunity, unaccompanied by restriction of liberty and badge of charity, of flying it forever. "A short life and a merry one!" Never was so dreadful an error circulated. It is the cruelest unintentional irony. "Merry?" quotha. We have just seen them in their merriest mood, and heard their very best pretense of gayety. But before those few hours of gas-light is there not the weary day, when the staring sun shines on the tinsel and the wine stains? Are there not lonely intervals of reflection, memories of happy homes mayhap, of innocent attachments, of gentle and womanly pleasures? And how often are they followed by dark moments of despair, when existence seems swallowed up in the blackness of darkness, when the future seems to reveal only a lower depth, and into the broken heart comes the wild longing

"to be hurled
Any where, any where, out of the world!"

But did we not promise to be sparing of our comments? The Haymarket is clear now, except of a straggler or so, a vendor of hot potatoes wheeling his empty oven toward the Seven Dials, or a chick-weed man, who addresses us incoherently, and is apparently very drunk, or a policeman stretching his arms and yawning under the colonnade of the Opera-house. A clear moon shines calmly on the now empty pavement, and Big Ben, from the tower of the Houses of Parliament, is solemnly and sonorously tolling two o'clock. These small hours like me not. The early morning zephyrs are of the keenest, too. Let us hasten home!

Captain Hart is one of the oldest and ablest officers in the Police Department in this city. For a long time he was in command of a police steamboat, and became a terror to the wharf and bay pirates that infest the water precincts of New York. The captain is a character. A sailor in early life, and the son of a sea-captain, he has all the blunt, frank qualities of the brave seaman, with none of Jack's vices. The captain is a great wag, though it is known only to the few who try to get the rig upon him, and then his wit and resources are all at command, and woe to him who thinks he can get the better of Captain Hart. He is just as brave as he is good, and a more daring, trusty, valiant, and successful officer was never in command of a ship or a squad.

Our distinguished and stalwart fellow-citizen, Jackson Schultz, when president of the Board of Health, had made himself and some friends merry at the expense of Captain Hart, who laid it up against the president, and waited his chance to get even with him. The chance came soon and suddenly, and in a way quite unexpected to both. Mr. Schultz and a party of friends were out on the East River in a yacht, and to their great annoyance got aground, high and dry, on Blackwell's Island, with a hole stove in the bottom of their vessel. Captain Hart was lying at the wharf of the island with his police boat, having just landed some prisoners. Mr. Schultz

immediately went over to the captain, who saw him coming, took in the situation, and prepared to give him as good as he had got.

MR. SCHULTZ. "Captain, my old friend, glad to see you: and your boat too. We've got aground, and I want you to take us off and set us down on the other side."

CAPTAIN HART. "Have you got a permit to leave the island?"

MR. S. "A permit! What in the name of wonder do you mean?"

CAPTAIN H. "Why, you can't get off the island without a permit: you know that as well as I do."

MR. S. "Come now, none of your nonsense, captain; you know well enough I am not sent here. We have run ashore, and you must take us off."

CAPTAIN H. "Yes, that's just what every man says who gets here. I never knew one who didn't say there was some mistake about it, and he wanted to get away as soon as possible. No, no, Mr. Schultz, that cock won't fight: you must get your discharge in the regular way, or just serve your time out. I'm very sorry for you, but I must do my duty, and please my friends afterward."

Just then the truth dawned on the Board of Health's mind that he had played a joke off upon the captain some time before, and was now sold in return. He owned up, promised to call it quits, or even to give up beat; and the captain, having tormented him sufficiently, gave him and his friends a free passage to town.

At another time a committee of the Legislature was on the captain's boat making a tour of inspection, and one of the members, Senator Andrews, who knew the captain of old, attempted to extract amusement for himself and his fellow-members by rallying the captain on his *preaching*, as it was reported that he sometimes indulged in that exercise.

"Oh," said the captain, "I've taken to the law lately."

SENATOR. "Not been admitted?"

CAPTAIN. "Yes, regular; passed my examination in open court."

SENATOR. "And answered all the questions fair and square, captain?"

CAPTAIN. "All but one."

SENATOR. "And what was that?"

CAPTAIN. "I don't like to tell; it may hurt your feelings, and some of the gentlemen here may be offended."

ALL. "Oh no; out with it: what was it? Let's hear."

CAPTAIN. "Well, the judge asked me—and I couldn't tell—'How can a man go to the Legislature, get three dollars a day, pay five dollars a day for his board, and lay up money?'"

The committee gave the captain a round of applause, and invited him to supper that night, which he positively declined.

IT seems to us that this will answer. It is just over from England, and has not got into American types:

A milliner's apprentice, about to wait upon a duchess, was afraid of committing some error in her deportment. She therefore consulted a friend as to the manner to be adopted, and was told that on going before the duchess she must say her "Grace," and so on. Accordingly, away went the girl, and on being introduced, after a very low courtesy, she said, "For what I am going to receive, the Lord make me truly thankful." To which the duchess answered, "Amen!"

THE recent publication of Lord Lytton's last novel, *The Parisians*, recalls one of many amusing criticisms on his early works, published in *Fraser's Magazine* for February, 1832. It appears in a report of "The great and celebrated Hogg Dinner," an imaginary banquet supposed to have been given in honor of the Ettrick Shepherd. The author of *Pelham* was among the guests, and in the course of the proceedings Sir John Malcolm rises to "propose the health of Mr. Edward Liston (*sic*) Bulwer, and the memory of that lamented gentleman, Mr. Eugene Aram." In reply, Bulwer begs the company to "accept a volunteer song that he had been practicing the whole morning for the occasion." Then comes

LISTON BULWER'S SONG.

Though Fraser may call me an ass,
I heed not the pitiful sneerer;
He freely opinions may pass—
Their value depends on the hearer.
An ass! yet how strange that the word
Thus used in malevolent blindness,
I, blessed with adorers, have heard
In tones of affectionate kindness.

There's Colburn avows I'm an assortment of all that is clever;
Ask Hall—he affirms such an assistant he never saw, never!
Cries Bentley, "My vigs! vot an assemblage of talents for puffing!"
Thus all are agreed I'm an ass:
A fig for Regina's rebuffing!

THE following, which occurred recently in one of the London courts, has not found its way into American print, and may possibly be worth a smile from some of our brethren of the bar:

Some two months ago Mr. Huddleston, Q.C., married the sister of the Duke of St. Albans, and was considerably chaffed by his brothers-in-the-law at the happy event. Not long afterward he was counsel for the defendant in a breach-of-promise case before Mr. Justice Honeyman. The counsel for the plaintiff indulged in Buzfuz, and read a letter of the defendant to the fair plaintiff, in which he described himself as miserable.

Mr. Huddleston remarked that every man was miserable till he married.

His lordship said Mr. Huddleston was a leading authority on the subject; in fact, he was the most recent case.

The judicial joke was greeted with roars of laughter.

NEVER was there a truer or better saying by an English judge than that of an eminent chief justice to a lawyer who, to illustrate his point, used an expression that provoked laughter. Instead of a reprimand, the judge observed that "the Court is very much obliged to any member of the bar who will enliven the tedium of legal proceedings with a little honest hilarity." The sublimest tragedies of Shakspeare are for a very good purpose intermingled with farcical and comical scenes. We find in an English weekly journal which is scarcely seen on this side an instance where more than the usual mirth was

provoked. It occurred quite recently at the Warwickshire Assizes, where Lord Chief Justice Bovill was trying a case of murder against a father and step-mother. At his request the male prisoner was defended by Mr. Buszard, who, in cross-examining the surgeon who had examined the deceased child, interrogated him as follows:

MR. BUSZARD. "Did you ever know of a case in which a person died of strangulation and could swallow afterward?" (Laughter.) The learned counsel immediately discovered the Hibernian character of his interrogation, and apologized for having raised a laugh in so serious a case. The judge, who had participated in the general merriment, said he was certain it was not intended. Mr. Buszard then repeated the query in another form. "Had the witness ever known a case in which a person had been able to swallow after the strangulatory act, and before the death?"

WITNESS. "I have not."

Mr. Buszard inquired if witness had ever seen a case of death by strangulation. After apparently running back through his memory for many years he replied, "Yes."

MR. BUSZARD. "Where was that?"

WITNESS. "At Idlecote."

MR. BUSZARD. "When?"

WITNESS. "On the 15th of last December."

MR. BUSZARD. "What! this case?"

WITNESS. "Yes." (General laughter.)

And so this trial for murder was enlivened by "general laughter," and the presiding judge was so tickled by a barrister's slip of the tongue that he could not refrain from joining in "the general merriment." Such a modern instance would help to prove Shakspeare's intimate knowledge of humanity, in which broad farce and deep tragedy are only removed from each other by very slender boundaries. In the other court, at the same assizes, Mr. Justice Denman was trying a case of alleged conspiracy, when, in the cross-examination of a female servant, there occurred the following scene:

His lordship asked the witness a number of questions, and in reply she said she used to sit on the door-step when she wanted to sit down, as there was no chair in the kitchen. His lordship asked her some questions relative to the beds and bedding, and witness laughed a good deal.

HIS LORDSHIP. "Why do you laugh? I have noticed you do it several times."

Witness continued laughing, but made no reply. On the question being repeated, she said she thought his lordship would understand bedding to mean mattresses and such-like.

HIS LORDSHIP. "Oh, then it was my folly you were laughing at. [Laughter.] Was that so?"

WITNESS. "Yes, Sir." (Loud laughter.)

HIS LORDSHIP. "And when you laughed during your examination and cross-examination by the counsel, I suppose you were laughing at their folly?" (Laughter.)

WITNESS. "Yes, Sir." (Loud laughter.)

HIS LORDSHIP. "I am very much obliged to you for your candor. I have learned something to-day. Good-day to you." (Loud laughter.) Witness then left the box.

Courts of justice are usually so dreary that the audience are always ready to seize upon the slightest provocation for a laugh, and in the foregoing instances they were quite justified in doing so.

CONCERNING "back pay," an amusing incident occurred just at the close of the late session of Congress. The House generously voted to pay committee clerks for the whole month of March, though the sessions only continued four days of that month. The officers charged with disbursements made up the bills promptly, and instead of letting the clerks, in usual course, take the bills to their chairmen for approval, they themselves took them around for that purpose. The officer who took the bill of the clerk of the Committee on Banking and Currency, of which the Hon. Samuel Hooper is chairman, is reported to have had the following colloquy:

MR. HOOPER. "What is this?"

OFFICER. "It is Mr. F——'s bill for the month of March. The House has voted to pay committee clerks for the whole month."

MR. HOOPER. "Why do you bring it to me?"

OFFICER. "We want to settle our accounts, and so are getting the bills all approved ourselves, instead of waiting for the clerks to attend to them."

MR. HOOPER (*hesitatingly*). "Well, I guess you may as well let my clerk bring this to me. I should like to see him. *I haven't had a sight of him for about a month.*"

THE following, fresh from over sea, is told at the expense of a distinguished and estimable son of Scotia. It seems that a dinner-party was in progress during a brilliant display of northern lights, and this gentleman, stepping out to cool his burning brow, was startled by the display. He stood amazed; then, turning to the window, saw, within, his wife, sitting with the ladies waiting for the gentlemen to end their claret and cigars. Pushing aside the lace curtains, he beckoned his wife Agnes to come out. She complied, when he said to her, solemnly,

"Wagnes, d'er see any thing exstronory now?"

"Yes, Dolly, I see you have been drinking too much wine."

"No, nor that, Wagnes; I mean exstronory phornomonums in atmosphere."

"Why, where, Dolly?"

"Up yonder, Wagnes."

"Why, dear me! yes, I do, indeed—the most brilliant aurora I ever saw."

"Wagnes, are things a-shootin'?"

"Yes, dear."

"An' a-flashin', Wagnes?"

"Yes, Dolly."

"An' a sorter spreadin' and dancin', eh, Wagnes?"

"All that, my dear."

"Ho!" (much relieved). "Do you know, Wagnes—I mean Agnes—when'r I come out an' saw the celestial phornomonums a-glowin' upper yonder, bless me effer I didn't think I was *in vino verit—ass.*"

THE accompanying lines are nonsensical enough. They were written to please a group of youthful folk, and serve to show that our En-

glish tongue is as capable of being twisted into "uncouth shapes" as is the Latin, if any one will take the trouble:

One winter's eve, around the fire, a cozy group we sat,
Engaged, as was our custom old, in after-dinner chat;
Small-talk it was, no doubt, because the smaller folk were there,
And they, the young monopolists! absorbed the lion's share.
Conundrums, riddles, rebuses, cross-questions, puns atrocious,
Taxed all their ingenuity, till Peter the precocious—
Old head on shoulders juvenile—cried, "Now for a new task:
Let's try our hand at *Palindromes!*" "Agreed! But first," we ask,
"Pray, Peter, what *are* Palindromes?" The forward imp replied,
"A *Palindrome's* a string of words of sense or meaning void,
Which reads both ways the same: and here, with your permission,
I'll cite some half a score of samples, lacking all precision
(But held together by loose rhymes), to test my definition:

"A milksop, jilted by his lass, or wandering in his wits,
Might murmur, '*Stiff, O dairy-man, in a myriad of fits!*'

"A limner, by photography dead beat in competition,
Thus grumbled, '*No, it is opposed; art sees trade's opposition!*'

"A nonsense-loving nephew might his soldier-uncle dun
With '*Now stop, major-general, are negro jam-pots won?*'

"A supercilious grocer, if inclined that way, might snub
A child with '*But ragusa store, babe, rots a sugar-tub.*'

"Thy sceptre, Alexander, is a fortress, cried Hephæstion.
Great A. said, '*No, it's a bar of gold, a bad log for a bastion!*'

"A timid creature, fearing rodents—mice and such small fry—
'*Stop, Syrian, I start at rats in airy spots,*' might cry.

"A simple soul, whose wants are few, might say, with hearty zest,
'*Desserts I desire not, so long no lost one rise distressed.*'

"A stern Canadian parent might in earnest, not in fun,
Exclaim, '*No sot nor Ottawa law at Toronto, son!*'

"A crazy dentist might declare, as something strange or new,
That '*Paget saw an Irish tooth, Sir, in a waste gap!*' True!

"A surly student, hating sweets, might answer with *élan*,
'*Name tarts? no, medieval slave, I demonstrate man!*'

"He who in Nature's bitters findeth sweet food every day,
'*Eureka! till I pull up ill I take rue,*' well might say."

CHIEF JUSTICE CHASE contributes an anecdote of the late President Lincoln that will be new to most of our readers:

When the draft just previous to his re-election was ordered, leading politicians of Indiana thought it injudicious, and appointed a committee, of which Governor Baker made one, to wait upon the President. They remonstrated with him against the draft without producing any effect, and finally urged the danger of his defeat in case Indiana should go against him, as they believed it would if the draft went on. "It is of no consequence," the President replied, "whether I am elected President or not. The country must be saved. We must have soldiers. The Union must be restored." Governor Baker went out from the presence of Mr. Lincoln feeling rebuked for having allowed party considerations to influence him enough to make the plea.

DURING the March term of the Oyer and Terminer, held in this city, Judge Brady presiding, a poor unfortunate named Nixon was tried and convicted of murdering Charles Phyfer. Notwithstanding the gravity of the trial, the testimony of a colored man, named William Henry Johnson, was given in a manner that rendered resistance to laughter impossible. It was given thus:

William Henry Johnson (colored) testified that on the day of the shooting he saw two men having an altercation in Chatham Street; one of them was on horseback, and the other drove a wagon. The man in the wagon told the man on horseback to get out of the way, when the latter turned round and attempted to strike him two or three times.

Cross-examined by District-Attorney Phelps:

Q. "Where do you live, Johnson?"—*A.* "In a garret." (A laugh.)

Q. "What is your business?"—*A.* "My wife follows the washing business, but she makes me do the work."

Q. "Where was the wagon when you saw it?"—*A.* "'Twas in the street." (Laughter.)

Q. "What part of the street?"—*A.* "In the street, not on the sidewalk."

Q. "On which side of the street?"—*A.* "On the same side that I was."

Q. "How near was the wagon to the sidewalk?"—*A.* "Well, upon my soul, I could not tell. That's a pretty hard thing to tell, as I did not measure it."

Q. "Are you deaf?"—*A.* "Sometimes." (A laugh.)

Q. "When you first saw the man on horseback, where was he?"—*A.* "On his back." (Great laughter.)

Q. "Where was the wagon?"—*A.* "Well, boss, I guess we talked about that before." (Applause.)

Q. "With what hand did he strike the prisoner?"—*A.* "He struck him with no hand; he struck him with the whiffletree. 'Pon my honor I can't say in which hand he held the whiffletree, except it was the right or the left." (Laughter.)

Q. "Were they near Barnum's clothing store?"—*A.* "Well, see here now, boss, I ain't able to read nor write, and I can't tell Barnum from A. T. Stewart, or any of them big folks, by looking up at their names."

Q. "When did you tell this to Mr. Howe?"—*A.* "Mr. Howe? Mr. Howe, when was it I went to see you?" (Great laughter in the court, and counsel joined.)

Q. "Did you know Nixon?"—*A.* "No, I did not know him from Tom, Dick, or the devil. [Continued merriment.] The fact is, boss, men will get into musses, particularly colored folks. You know, some folks bees down on the colored people. I mean folks as have no eddication, and don't know their grammar nor their dictionary. I can write my name—no, I can't either, come to think of it." (Laughter.)

Q. "Do you know officer Van Buskirk?"—*A.* "Who? What? Does he know me? I guess not. No, Sah." (Laughter, during which the Court ordered the witness to retire.)

HARPER'S
NEW MONTHLY MAGAZINE.

No. CCLXXVIII.—JULY, 1873.—Vol. XLVII.

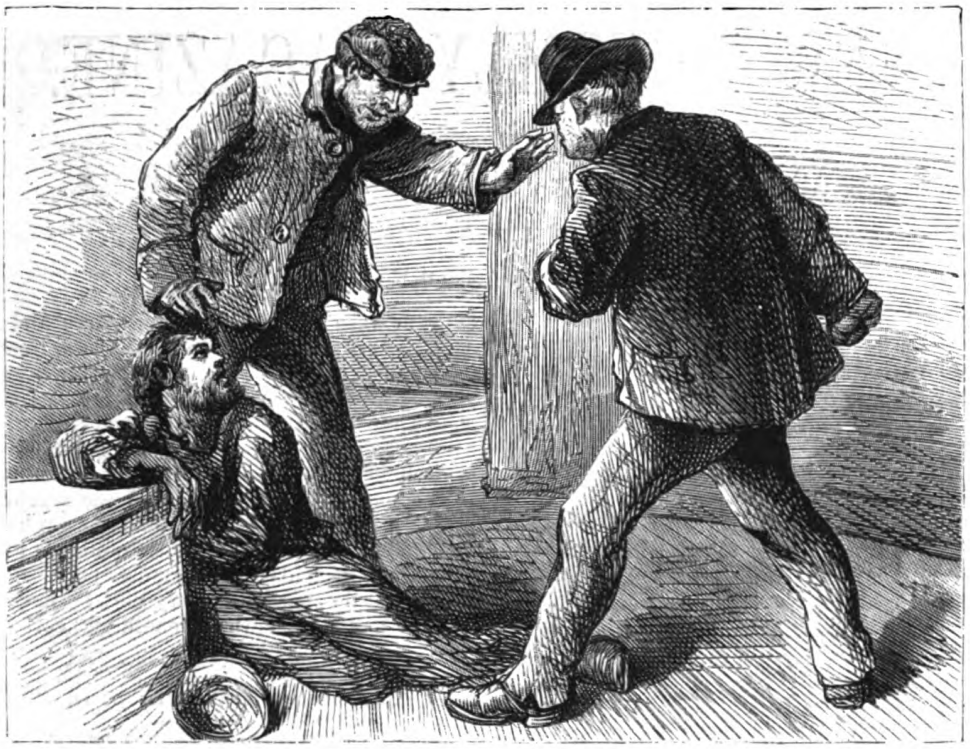
JACK ASHORE.

AROUND THE GLOBE.

PEACEABLE citizens view the slips of a sailor ashore with a loving indulgence that is not accorded to any class of landsmen. The fuddled condition in which he is too often found fails to excite the loathing which we can not check when an intoxicated Celt comes bearing down upon us, and by a casuistry not altogether unaccountable we laugh at his propensity to "kiss the book," as Stephano in *The Tempest* affably paraphrases his fondness for "celestial liquor." A roving blade, and during the greater part of his life necessarily beyond the normal influences of inland society, he gains a strong individuality. Primitive impulses hold him submissive; he is superstitious and dependent, yet wayward and not easily thwarted; consequently the moment he is released from the slavery of the ship he flies from the extremes of discipline to the lowest dissipation of freedom. The conditions of his life entitle him to abundant charity, but a careless condonation of his vices is detrimental to all efforts for his improvement, and the fact that he is as fit a subject for rational philanthropy as the farm laborer ought to be borne prominently in every mind. In most nautical novels and ballads the jollities of a sailor's life experiences ashore are painted in rosy tints, and the inevitable misery following debauchery and excess, from which our tars are even less exempt than any other human beings, is glossed over in a manner that will not bear the strictest analysis. Marryat and Dibdin, always brilliant in characterization, but frequently incorrect, have portrayed a creature to whom care is unknown and the whole world extends a benevolent hand; at sea he is chiefly occupied in receiving a double supply of grog from his captain, or dancing hornpipes, and on shore at "every port he finds a wife," and "sports the splendid guinea."

> "While up the shrouds the sailor goes,
> Or ventures on the yard,
> The landsman, who no better knows,
> Believes his lot is hard.
> But Jack with smiles each danger meets,
> Casts anchor, heaves the log,
> Trims all the sails, belays the sheets,
> And drinks his can of grog."

The impression thus conveyed is pernicious, and as false to reality as are Mr. Dion Boucicault's Irish peasants. The can of grog is generally adulterated villainously, and the "splendid guinea" is drawn from his pocket by robbers while he lies stupefied from liquor on some unclean floor. "The little cherub" can not be trusted to meet every emergency, and vigilant, thoughtful human endeavor can alone atone for the past neglect, and insure the future improvement of a class of men on whom depend the prosperity and honor of every maritime nation. If it be considered, as it reasonably may, that our way to the recovery of ocean commerce lies fully as much in manning our merchant navy with intelligent and temperate men as in the building of vessels, the importance of attention to the condition and influences which surround sailors on land will be appreciated.



Personally, Jack is shy and difficult of access, with a healthy horror of ostentatious aid. They who would impress him favorably must be quiet and in earnest, for he is suspicious of "tracts," and will more readily believe the boarding-house keeper than the colporteur. If he has frustrated some schemes for his welfare, it is because they were made in ignorance of his nature, and

Entered according to Act of Congress, in the year 1873, by Harper and Brothers, in the Office of the Librarian of Congress, at Washington.

THE TOUTER AND HIS CONFEDERATE.

it is manifestly unfair that he should be passed with a merely tolerant exclamation of good-will. Until recently no adequate laws had been made for his protection in America, and while a very effective code was in operation in Great Britain, here he was the undisputed prey of the most degraded and rapacious land-sharks. As I have intimated, a very important reform has been attempted recently in the enactment of provisions based upon justice, but these are less preventive than restrictive; and it must be remembered that the abuses of generations can not be effaced by the remedial measures of one year.

Remarkably grateful, a sailor once won to a man or a cause becomes a steadfast, affectionate, and enthusiastic adherent. His colors are true-blue, and a friendly action, a caressing hand in sickness, or a pleasant word at an opportune moment will keep green in his memory through life.

"'Longside of an enemy, boldly and brave
He'll with broadside on broadside regale her;
Yet he'll sigh to the soul o'er that enemy's grave,
So noble's the mind of a sailor."

Probably those who most thoroughly comprehend his nature are the boarding-house keepers, who, however desperate on occasion, invariably try to cajole before they venture to force. As soon as a ship arrives in the lower bay the touters of these worst of men board her, if, under the new shipping law, they can evade the deputy-commissioners, and stealing into the forecastle, demand the sailor to tell where he intends to lodge while in port. A burly confederate stands near the touter, and if a ready answer is refused, the sailor receives an unexpected and stunning blow in the face. When he recovers he finds the principal remonstrating with the confederate for his brutal interference, and appreciative of the timely sympathy, Jack surrenders himself to the tender mercies of the wolf, one of his best qualities thus becoming a means of his own destruction. Perhaps before the ship is fairly moored he is enticed ashore, and driven to one of the gloomy dens in Cherry, Water, or Roosevelt Street, where he has no more hope than a school-boy in a gambling-house. His stay in port may be a week or a month, according to the amount of wages due to him; but his treatment will be the same as long as his money lasts, and when it has gone he will as surely be cast adrift. Formerly he seldom touched his own pay. The boarding-house keeper made a trifling advance when the sailor landed, and as seven or ten days elapsed before the ship-owners paid off their crews, a heavy bill against him for food, lodgings, and raiment had been run up. The money accruing, therefore, from a winter voyage around the Horn or across the Atlantic fell by power of attorney, or a less legal instrument, into the hands of the boarding-house keeper. If the bill represented a larger amount than the

wages, Jack was shipped off at once, an advance note, payable several days after the sailing, having also been extorted from him. At present, under the beneficent shipping act, the sailor is paid in person before the Commissioner at the end of his voyage, and the boarding-house keeper can fleece him no more directly than by extortionate charges. But that our seamen are unconscionably bled in boarding-houses is not the most telling charge that can be brought against these wicked institutions. More vital importance attaches to the fact that a sailor within their doors is far removed from every agency of physical and spiritual good, and that with each successive voyage he becomes less able to perform his duties on shipboard, more nervous in the perilous moments when life and treasure depend upon his courage, and further behind the comprehension of the many recent scientific discoveries tending to simplify ocean navigation. His love of old associations and cordiality is the means whereby he is caught. A collier will drink at "The Mine," a tinker at "The Blacksmith's Arms," a railway employé at "The Double Track;" and houses bearing nautical names—for example, "The Flowing Sea," "The Mariner's Home," or "The Sailor's Return"—have an irresistible charm for seamen. The fanciful name is not the only attraction, however. Trophies of travel or war, a model ship or a rusty cannon, cheap specimens of marine art, and flashily dressed courtesans, are equally conspicuous and potential. One of these rookeries corresponds closely in the exterior and interior with all others. The building is unsteady and dilapidated, the location being an odoriferous corner of the winding lanes that skirt and diverge from the East River front. The surrounding structures are similar in style and appearance; the ruined mansions of our old families are here awaiting the long-deferred end of their vicissitudes, meantime affording refuge for criminals whose avocations are plied nearer to the heart of the city, as well as to the numerous "dock rats," whose foraging ground is more accessible. The sailor's boarding-house can not be distinguished upon a hurried survey, but a careful examination will reveal it by the landlord's imbecile travesties upon home comforts and beauties. A neglected geranium or fuchsia has been placed in the window, the dusty surface of which is seamed like the tearful face of an unclean child; a yellowish and tattered lace curtain has been raised across it, and behind this again is plainly shadowed a cluster of repulsive women, who are alternately gossiping with the idlers at the bar and leering at the passers-by, or fooling with a needle and a strip of calico in the endeavor to affect the womanly charms of quiet conversation and industry. If you have the courage to explore and listen to rude jokes, which you can not possibly answer, in the first room you will find that the men to whom the women have been talking are unoccupied sailors, whose faces are pitifully devoid of intelligence, their eyes being dull and inexpressive of decent emotion. The men expectorate, hitch up their trowsers, dive their hands deeply into their empty pockets, and are as inattentive to the chattering of the women as to the story which is being told by the man behind the bar, who, nevertheless, is a mighty political auxiliary of the Custom-house, and between the perquisites of the primary and wages of his boarders is enabled to live in undeserved sumptuousness. The misery of last night's excesses is upon the crowd; one and all are

heavy and weary—as hopeless and dejected as men who are under sentence for crime. Anon an incident diverts and stirs them. A hack drives up to the door, and a seaman, already half intoxicated, is dragged out by two touters who accompany him. The landlord and women close about him, the first with profuse words of welcome, and the latter with violent caresses. The plump hint that the new-comer shall prove himself the generous, lavish fellow of past experience is not necessary, and all present advance to the bar, as the counter, three mysterious bottles, two lemons, and a meagre assortment of impaired crockery are politely designated. Poor Jack! He toasts Meg, Margery, and Kate, and then, in an altered, trembling voice, remembers his mother, an action decried by the women as unmanly and religious. But the better mood in such an atmosphere only endures a little while, and then, by example and appeal, he is encouraged in the horrible debauchery for the practice of which the house is maintained. Three items are already recorded against him in the blotted ledger for deduction from his wages—three dollars are charged for the boat which brought him ashore, two dollars for the hack, and two more for the poisonous drinks supplied to the company. In a very few days all he has earned by very many days of severe toil is exhausted, his hands are unsteady, his head giddy, home ties are thought of impatiently, and again dreary forecastle life is resumed.

The night scenes of the dance-room give the truest idea of the contaminating influences that are exerted for the moral impoverishment of sailors and the enrichment of the landlords. Behind the bar, appropriately, is situated the crib, wherein are held the revelries which draw down our mariners to a criminal level. A screen hides the interior from the street, and also secures to the habitués safety from police raids, since our officers are too busily occupied in the punishment of overt vice in this district to attend to cautiously sequestered instances. In a low-roofed, dimly lighted apartment, only a few feet square, a reeking audience

gathers. The "dance" is, of course, a bold euphemism for indescribable sin; as the hour flies the license grows greater: the pseudo-sewing-women are now in their own satanic element. In writing here we can not be more specific. If philanthropists desire to learn of opportunities for good work, let the police and overworked missionaries testify.

In all we have said it has not been our intention to imply that nothing has been done in behalf of sailors ashore, or that no agencies are working to secure those improvements so desirable and imperative. Organizations conducted by a few of the foremost merchants in this port are striding ahead rapidly in the humane effort of elevating seamen, and thereby enhancing our maritime power. Inadequacy, due largely to the difficulty of making charitable people comprehend that toilers of the sea are not irreclaimable, can alone be laid at their doors; inefficiency can not. Of the reforms that have taken place, especially during the past three years, no more convincing evidence can be needed than this: an eminent metropolitan journalist estimated in 1868 that there were in this city no less than 169 sailors' boarding-houses, in which 15,000 seamen were annually robbed of at least $3,000,000; to-day there are only about ninety houses, and of these forty are licensed. The demand for protective legislation has been partly satisfied in the act by which commissioners are appointed in the several circuit courts of the United States to supervise the shipping and discharge of seamen engaged in merchant vessels. The State law enacted in March, 1866, for the repression of dishonest boarding-house keepers, which had through political influence secured an adverse judicial decision, has been revived, and has abolished a few houses, while it has checked lawlessness in all. Outrages still occur, but the movement to uproot them is not declining or losing adherents, although its vicissitudes are numerous and its means limited.

The oldest benevolent institution in America in connection with seamen is the Marine Society of the City of New York, organized in 1770, which from a fund of $62,000 and members' dues affords aid amounting to from $75 to $95 each, per annum, to sailors' widows. Notwithstanding the somewhat narrowed sphere of this society, for some unexplained reason the spirit which animated its founders did not continue; most of them, in fact, concluded, after an apparently superficial trial, that efforts for the improvement of sailors must prove futile, and for nearly half a century the land-sharks had their own way. The broad philanthropy and consistent methods of to-day were not then ripe, and when, in 1816, another attempt was made in Jack's behalf, the need of improving his physical condition before exhorting him to a spiritual life was overlooked. The attentions paid him, however, were not unprofitable, and led to subsequent practical work. The Rev. Ward Stafford preached the first sermon to seamen in America, at the school-house No. 37 Cherry Street, on December 20, 1816; the New York Marine Bible Society was formed two years later; and in 1820 the Mariners' Church in Roosevelt Street, the first ever built, was dedicated. The Bethel flag, first hoisted on the ship *Cadmus*, Captain Christopher Prince offering prayer, appeared frequently at the mast-heads of the vessels wharfed around the island; and on May 5, 1828, the question, "How can sailors be made intelligent and healthy, as well as Christians?" was partly answered in the formation of the American Seamen's Friend Society, with the Hon. Smith Thompson as president, and the late Bishop M'Ilvaine as secretary. With this the movement for the welfare of Jack fell into the hands of men of wealth and liberal culture; he was no longer prayed at, and then left to the vicious associations and discomfort of the boarding-house; thereafter, if he chose, he might avail himself of the same opportunities that landsmen have for education, refinement, and saving; with the Bible should be proffered a loaf of bread, decent lodging, and protection from his enemies. The second clause of the new society's constitution expressed its object thus: "To improve the social and moral condition of seamen by uniting the efforts of the wise and good in their behalf; by promoting in every port boarding-houses of good character, savings-banks, register-offices, libraries, museums, reading-rooms, and schools, and also the ministration of the Gospel and other religious blessings."

Starting with aims so liberal, and with a definite understanding of what would be required from it, the society could not fail. It has prospered; the material work has been carried on abreast of the evangelical, and in many ports throughout the United States, and in foreign countries largely frequented by American seamen, it has erected Sailors' Homes and missionary stations. The substantial works it has dedicated to the seamen of the port of New York alone prove its immense value. One of the earliest of its ventures was the publication of a little magazine advocating Jack, and in the year following its incorporation the society had so far impressed the claims of its wards upon the public mind that the Seamen's Bank for Savings was opened. Although this institution has lost its distinctiveness, and is now engaged in a general business, having deposits amounting to $10,400,000, $2,000,000 still lie in it to the credit of seamen. The Colored Sailors' Home was next instituted under the auspices of the society, and in 1842 a like home at No. 190 Cherry Street

THE SEAMEN'S EXCHANGE AND THE CHERRY STREET HOME.

was ready for the reception of white seamen. Since its opening the former has accommodated 17,486 men, while the latter has found room in the same time for 79,978.

The good influences current in these homes almost counterbalance the bad influences brought to bear in the characterless boarding-houses. There are faults which are plain enough to those who seek them; the present buildings are in some respects unsuited to their uses; the charge of inadequacy again recurs; but the results they obtain discourage cavil. In their administration they are laudably wise. Eminent tact is required in the treatment of seamen, and this is possessed to a singular degree by the managers of the homes. An institution which in the event of an infraction of rules would severely censure and threaten would never answer as a harbor for "Jack ashore." Considerate and not too numerous rules leniently enforced, a mild remonstrance instead of an ascetic rebuff, forbearance and good humor, are the virtues which his friends must practice. He is also sensitive and hesitating in accepting favors that are not given from the heart, and this independence he has been enabled to preserve in the homes, which are self-supporting.

The Home in Cherry Street is partly hidden by the Seamen's Exchange. It has the aspect of an ordinary hotel, and displays no distinguishing sign, unless it be the wooden figure of a naval lieutenant perched on the cupola near the flag-staff. Groups of tanned and stalwart men are chatting in the wide balcony and in the smoking-room, which is entered from the hall. In the basement front is a clothing store, and in the rear a spacious dining-room. Breakfast is served from six to seven o'clock, dinner from twelve to one, and supper at six. The quality of the food supplied is excellent, and the quantity unlimited. Passing to the first floor again there is a room, set apart for the purpose, in which a weather-beaten old tar, recently home from a five-years' trading voyage to the South African coast, is entertaining two handsome young daughters, who have traveled from a Minnesota village to see him and kiss him. The reading-room and museum are also on this floor. Curiosities from every clime in which American sailors have frozen or melted are aggregated here in cabinets, simply labeled in the crude handwriting of the contributor. Relics of lost vessels, of battles, hunts, explorations, and aboriginal loves; a splintered spar which sustained the giver one dark night upon the waters; a rusty cutlass stained with the wicked blood of a Malayan pirate; a quiver of Indian arrows; a stone pilfered from a Chinese temple; and the varicolored plumes worn by a South Sea Island belle at a ball given by the crew of an American ship—are clustered behind the glass doors, and from their dusty shelves speak countless volumes of thrilling adventures on the flood and in the field. Abundant

reading matter can also be found in this hall, which is clean, light, and airy.

The three upper floors are occupied as bedrooms. About 150 lodgers can be conveniently accommodated, but the average number is 100. Baths with hot and cold water are always ready for use. The rooms of the regular boarders are mostly single-bedded, and are better furnished than those given to casual guests. Disturbances among the men are rare. Occasionally a backslider comes home three sheets in the wind after closing hours, but he can not withstand the amiable appeal of Mrs. Alexander, the matron, and allows her to send him quietly to bed. Our inspection is incomplete unless we are introduced to this lady—"Mother" Alexander, as she is affectionately called by the sailor, to whose care she is heartily devoted. She has aided her husband in superintending the Home for several years past, and is as proud of her boarders as they are of her. A comely woman, and spirited in the work that lies nearest to her, she exercises a power over the most austere and apparently uncompromising sinners. She is jolly and practical, and by the charm of her own personality reclaims and uplifts those about her. Her cozy private sitting-room is overcrowded with tokens of gratitude, which are every day being brought to her from men in the obscurest corners of the globe. From these profuse mementoes she might stock and maintain a menagerie, a museum, or a fancy-goods store. One man vouches for his affectionate remembrance of a kindness received in port by a chameleon, which he has sent home from a Mediterranean town by a friend; another, with an exquisite comprehension of woman's instinct, has remitted an ugly Hindoo god, accompanying it with, not incense and myrrh, but a love of a stuffed and exceedingly rare monkey. A very rude effort at oil-painting hangs from one of the walls, and its wonderful defects might be accounted for by the facts that forecastle light, in which it was executed, was bad, and that the author had never attempted any thing of the kind before. The live stock that arrives at Mrs. Alexander's doors includes cockatoos and gold-fish, Spanish poodles and small tigers. Parrots and monkeys are a sailor's favorite tokens of remembrance, however, and these are given in such quantities that one of her greatest desires is to make friends who will accept her innocent little Darwinians.

During the year ending May, 1872, the number of boarders was 2200, an increase of 238 over the previous year, and of 1237 over the year before. These included both seamen and mates, but not captains, who object to associating on shore with their subordinates. During the same period the men deposited $32,741 with the superintendent for safe-keeping, and of this amount $16,144 was sent to relatives, and $3843 was placed

THE SAVINGS-BANK.

in the savings-bank. Shipwrecked and destitute seamen applying to the American Seamen's Friend Society are sent here, and gratuitously provided for until they obtain another ship. The uniform charge of board and lodging is seven dollars per week, as in the licensed boarding-houses. The boarders' opportunities for dishonesty are numerous, but a defaulter is exceptional, seamen, as a body, being noted for their integrity. The Home building is owned by the society, and is leased to the superintendent, who conducts it upon an independent basis, although a percentage of his profits is paid to the society, which also reserves the right to supervise and regulate the tariff.

Across Cherry Street lies the Seamen's Exchange, the front of which is on Water Street, partly visible a little north of the New York bridge tower, to passengers by the Fulton Ferry boats, and noteworthy as the largest edifice dedicated to sailors in America. "This building gives the sailor comforts which he will appreciate, and such influences will preach religion to him if Christianity is never mentioned," remarked Henry Ward Beecher at the opening services, April 17, 1872. Another grand effort has here been made for the secular benefit of the sea-farers, of whom over 60,000 come to this port annually, at least 3000 being in port at all times. Not intended to supersede the several minor reading-rooms and Bethels near the wharves, the aim of the Exchange is to furnish all kinds of rational entertainment. As in the adjoining Home, part of the basement is devoted to a clothing store, where every requisite for a sea outfit can be purchased at low rates, and the remainder is used as a bowling-alley. A savings-bank and reading-room occupy the first floor, and a hall capable of seating about 800 people, which will be used for lectures, concerts, and prayer-meetings, is located on the next floor. Above are the offices of the United States Shipping Commissioner.

At the time of our visit few sailors are in attendance, as the old boarding-house keepers are holding back their boarders from shipping until the Commissioner will consent to omit irksome points from the en-

forcement of the new law. In passing, let it be said that a few days subsequently we heard that the Commissioner remained obdurate, and the "strikers" surrendered. The bulletin giving the names and destinations of vessels wanting crews is full. At the surrounding desks a number of men are signing articles for a voyage in the *Susy B*—— to the Labrador coast. The articles form the agreement, executed in printed legal forms, between the men, masters, and owners. The wages, services, and food of the man shipping are precisely stipulated. The mariner agrees that he will be orderly, faithful, honest, and sober. The master binds himself to pay $35 per month (the ordinary wages of an able-bodied seaman), and to provide a certain dietary. The first day's allowance for each man, which during the rest of the week differs only in the substitution of cocoa for coffee or pork for beef, consists of one pound of bread, one pound and a half of beef, half a pound of flour, one-eighth of an ounce of tea, half an ounce of coffee, two ounces of sugar, and three quarts of water. At another desk a crew recently arrived home is being paid off. Certificates of discharge are given to all men, the blank for character being filled variously with "B." (bad), "V. G." (very good), or "G." (good). The impositions formerly practiced by unprincipled men are by this simple method greatly restricted. Every man before shipping is now required to produce his discharge. Should he have deserted his last ship, the discovery of the fraud is almost unavoidable.

We started on our tour from the offices of the Seamen's Friend Society, at No. 80 Wall Street, with details courteously supplied by Rev. Dr. S. H. Hall, its corresponding secretary; Mr. L. P. Hubbard, the financial agent; and the Rev. H. H. M'Farland. Sailors with whom we have talked have alluded to "loan libraries." Let us return to head-quarters and inquire what they are. In calm weather and on long voyages the men have many idle hours, and no means of recreation, and in view of this the society, in 1859, began furnishing naval and merchant ships with loan libraries. Each library contains about forty-five volumes, in a strong wooden case, which is lodged with the captain of the ship. The character of the libraries is strongly religious, but not sectarian. It may appear from the following schedule that a larger proportion of secular works would be a wise change: Nelson on *Infidelity; Sailor's Companion; Path of Peace; Way of Life;* Hall's *Papers for Home Reading;* Spurgeon's *Sermons;* Kitto's *Daily Bible Illustrations; Pilgrim's Progress;* Dr. Cuyler's *New Life; Illustrated Library of Wonders; Progress of Discovery; Dictionary of the Bible;* Captain Russel's *Watchword;* books on natural science; biographies; *Seamen's Hymns;* temperance publications; and other works of a not especially attractive character.

The total number of libraries now afloat is about 4500, or about 185,000 volumes, accessible to 180,000 seamen. The report for the year ending May, 1872, shows the following facts: Number of new libraries sent to sea, 312; refitted and reshipped, 424; total (available to 10,888 men), 756; conversions during the year in connection with the work, 70. Both officers and men use the libraries, and the volumes are returned to the society, often years after their issue, in perfect condition; often, too, when a ship has been lost, the library has been placed in a small boat, with the compass and a little store of food, and so preserved.

The work and means of this society, and several others of less magnitude in New York, are steadily advancing. The shipping act has not crushed all the land-sharks, and the new Exchange has not for members all the sailors who come to this port. True and permanent reforms move very slowly, as the best oak grows. But if the movement for the improvement of Jack ashore is never permitted to recede, an increase in number of American ships and in the prestige of the navy is beyond all uncertainty.

HOLIDAY.

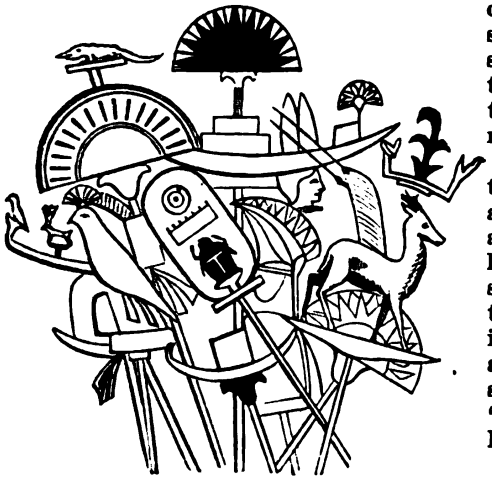
THE earth is nothing but flowers and grass;
The sky is a light, and the wave its glass:
I will make a part of the shadowless whole,
And be a body without a soul.

I leave the troublesome creature bound
By hopes and fears that hedge it round;
So may I look, for a single day,
To live unhindered the life of May;

To spring into bloom from the clover root;
To feel the sap in the young leaf shoot;
To hive my honey, to spread my wing;
To work or idle with any thing;

To slide with the fly on the water's face,
And swim with the fish that follows chase;
To feel myself once more at one
With all the life that is under the sun!

But what is sighing about the spot?
What sound of wind where wind is not?—
Poor wretch! pursued by all thy cares,
Hast stolen after me unawares?



Go, get thee back, kind soul, I pray!
Sad or merry another day,
I ask for only these few short hours
To grow in the light like grass and flowers.

But still the poor soul, all undone,
Sighs and shivers beneath the sun!
I can not bear that pitiful pain—
The homeless creature must come again.

Alas! the time when I could lie
As free from thought as the open sky
Is never for me, henceforth, I trow:
Soul, we must comfort each other now!

NATIONAL STANDARDS AND EMBLEMS.

EGYPTIAN STANDARDS—PHARAOH'S ARMY.

CARLYLE sees, he tells us, in a nation's military banners "the divine idea of duty, of heroic daring; in some instances of freedom, of right."

We find representations of standards on the oldest bass-reliefs of Egypt. Sacred rites were performed to them; and they were regarded with a degree of awe which lent a peculiar significance to the words of Solomon, "Terrible as an army with banners."

It is related that the standard of Mohammed was held in such sacred awe that it was death to any infidel who dared to look upon it. It was carried in procession at one time, when several hundred Christians, who ignorantly gazed upon it, were massacred by the Turkish populace.

In our time the standard flag is the symbol of the independent and self-contained life of a people, and it awakens in the dullest heart some sense of what is due to the individual from the state, of the value of honor and patriotism and temperate discipline.

"It is in and through symbols," adds Carlyle, "that man consciously or unconsciously lives, moves, and has his being: those ages, moreover, are accounted the noblest which can the best recognize symbolical worth, and prize it the highest."

A soldier's fidelity to his flag has in it something ennobling and sublime, and gives him a share in the national life and liberty of which that flag is the emblem. Tattered, shot-torn, smoke-blackened, it is nevertheless a symbol of the highest value and importance, and has power to direct the thoughts and passions of individuals, so that a mighty host becomes as one man. Moreover, it is a symbol of a nation's past. Bright memories of victory flash about it; or perhaps some recollections live in its drooping folds of a day of disaster and shame, or a time of oppression and suffering; so that, gazing upon this mysterious symbol, the citizen and the soldier feel the hot blood throbbing at their heart, and the battle-light reddening on their brows.

Colored banners were evidently among the earliest symbols used as military standards, and as tribes multiplied they gradually became party-colored by stripes and linear divisions. In the earlier times the shield was colored in its device similar to the flag, and, as a custom, these colors were identified with the dress of the tribe or party as distinguishing features. We read of Joseph's "coat of many colors," and that "Mordecai went out from the presence of the king in royal apparel of blue and white."

The distinctions produced by different colors have pervaded all the affairs of life, ancient and modern. They characterized the games of the Roman circus, and the different factions of the hippodrome were distinguished by their colors of white, red, blue, and green; to these Domitian added yellow. Homer speaks of the purple banner of Agamemnon.

In the crusade under Richard Cœur de Lion and Philip Augustus the French were distinguished by red crosses, the English by white, and the Flemish by green.

All maritime nations have always had certain marks, signs, or colors to distinguish their vessels. We read in Ezekiel (xxvii. 7), "Fine linen with broidered work from Egypt was that which thou spreadest forth to be thy sail; blue and purple from the isles of Elishah was that which covered thee."

Pliny tells us that the stern and prow of trading vessels and men-of-war were, without exception, decorated with colors; and at Athens, Corinth, and Sicyon the profession of ship-painters founded the famous school of painters in those cities.

The invention of standards is attributed by ancient writers to the Egyptians, and this with great probability, as they had the earliest organized military forces of which we have any knowledge; we may, therefore, feel tolerably certain that the Hebrews had the idea of at least the use of ensigns from the Egyptians. Diodorus informs us that the Egyptian standards consisted of the figure of an animal at the end of a spear. Among the Egyptian sculptures and paintings there also appear other standards, which either resemble at the top a round-headed table-knife or an expanded semicircular fan. The latter are attributed to the Greco-Egyptians; but we are unable to find any satisfactory data to show that they were other than varieties of most ancient standards. The early Greeks employed for a

ANCIENT ASSYRIAN STANDARDS.

standard a piece of armor at the end of a spear; but Homer says that, as above stated, Agamemnon used a purple veil with which to rally his men. The Athenians afterward, in the natural progress which we observe in the history of ensigns, adopted the *olive* and the *owl;* and the other Greek nations also displayed the effigies of their tutelary gods, or their particular symbols, at the end of a spear. Some of them had simply the initial letter of their national name.

The standards of the Egyptians, used in the army of Pharaoh's time, form a curious group of implements. Each regiment and company had its own peculiar banner or standard, constituting a numerous collection of strange devices. Beasts, birds, reptiles, or a symbolic combination of emblems, were the ordinary objects employed. A prominent and evidently much respected standard among others was that, elsewhere alluded to, in the form of a semicircle, bearing what may be regarded as representations of the sun, moon, and other heavenly bodies. All were evidently objects of superstitious veneration, which were calculated to awaken in the Egyptian soldiers that degree of enthusiasm indispensable to success in warfare.

Allusions to standards, banners, and ensigns are frequent in the Holy Scriptures. The four divisions in which the tribes of Israel marched through the wilderness had each its governing standard, and tradition has assigned to these ensigns the respective forms of the symbolic cherubim seen in the visions of Ezekiel and John—that of Judah being a lion, that of Reuben a man, that of Ephraim an ox, and that of Dan an eagle. The post of standard-bearer was held at all times as of the greatest importance, and none but officers of approved valor were ever chosen for such service; hence Jehovah, describing the ruin and discomfiture which he was about to bring on the haughty King of Assyria, says, "And they shall be as when a standard-bearer fainteth."

The ancient Persian standard is variously described. It seems to have been a golden eagle at the end of a spear fixed upon a carriage. They also employed a figure of the sun, especially on great occasions, when the king was present with his forces. Quintus Curtius mentions the figure of the sun, inclosed in crystal, which made a most splendid appearance above the royal tent. We therefore presume it was the grand standard, inasmuch as, even at this day, when Mohammedanism has eradicated most of the more peculiar usages of the Persians, the sun continues to divide with the lion the honor of appearing on the royal standard.

Among the very ancient sculptures at Persepolis we discover specimens of other standards. One of these consists of a staff terminating in a divided ring, and having below a transverse bar, from which two enormous tassels are suspended. The other consists of five globular forms on a cross-bar. They were, doubtless, of metal, and probably had some reference to the heavenly bodies, which were the ancient objects of worship in Persia. The proper royal standard of that country, however, for many centuries, until the Mohammedan conquest, was a blacksmith's leathern apron, around which they had at one time been rallied to a successful opposition against the odious tyranny of Zahawk.

Many national standards have arisen from similar emergencies, when that which was next at hand, being seized and lifted up as a rallying-point for the people, was afterward adopted, from an enthusiastic attachment which clung to it as having been identified with patriotic deeds.

In this way originated the horse-tails of the modern Turks, and the bundle of hay at the top of a pole, adopted at one

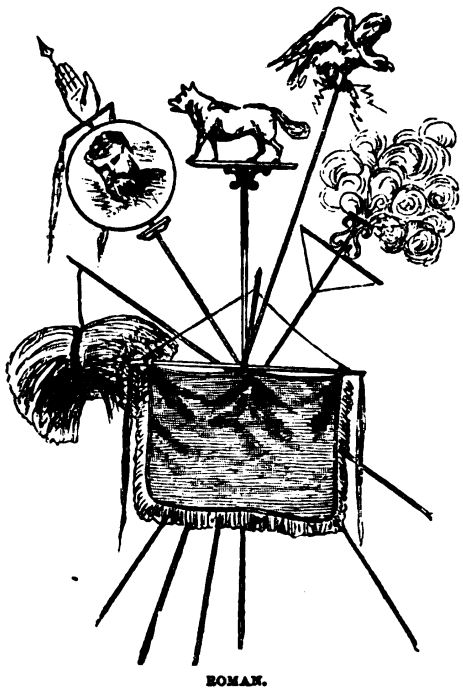
TURKISH AND PERSIAN.

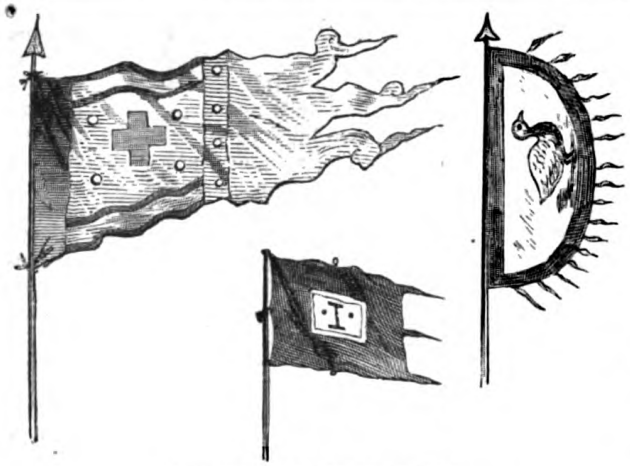
time by the Romans as the ensign of the *manipulus*.



At this time each "maniple" of troops had its peculiar ensign and standard-bearer. Following the bundle of hay we find in use a spear with a cross-piece of wood at the top, sometimes with the figure of a hand above, and below a small round or oval shield of silver or gold. On this were represented the warlike deities, Mars and Minerva, but, after the extinction of the commonwealth, the effigies of the emperors and their favorites. From this custom the standards were called *numina legionum*, and were regarded with religious veneration.

The standards of different divisions of the Roman army had certain letters inscribed on them for distinction. The standard of a legion, according to Diodorus, was a silver eagle with expanded wings on the top of a spear, sometimes holding a thunder-bolt in its claws; hence the word *aquila* was used to signify a legion. The place for this standard was near the general, almost in the centre. Before the time of Marius figures of other animals were used. The vexillum, or flag of the cavalry, was, according to Livy, a square piece of cloth fixed to a cross-bar at the end of a spear. These flags had sometimes fringes and ribbons. The divisions of a legion had also their particular ensigns, sometimes simply attached to the end of a spear and sometimes fixed below the images. An infantry flag was red, those of the cavalry blue, and that of a consul white.

Layard says, in *Nineveh and its Remains*, regarding the standards of the Assyrians: "Standards were carried by the charioteers. In the sculptures they have only two devices: one a figure (probably that of the divinity) standing on a bull and drawing a bow; in the other, two bulls running in opposite directions. These figures are inclosed in a circle, and fixed to a long staff ornamented with streamers and tassels. The standards seem to have been partly supported by a rest in front of the chariot, and a long rope connected them with the extremity of the pole. In a bass-relief of Khorsabad this rod is attached to the top of a standard."



The national ensigns of the Romans were various, and varied from time to time, according as new conquests were made, or superstitious feeling exalted or degraded a symbol. Pliny observes that the eagle was the first and chief military ensign; others were the wolf, the minotaur, the horse, and wild-boar. Before the time of Caius Marius the eagle only was borne in actual warfare; the other ensigns were left behind in the camp. Caius Marius rejected altogether the other emblems, and retained the eagle exclusively. But at a subsequent period some of the old emblems were resumed. We find the wolf among the ensigns of the Trajan column. The dragon, the ensign of the Parthians, was adopted, as shown by the Arch of Severus; it was the device also of the Dacians, and seems to have been a general ensign among barbarians. The dragons were embroidered in cotton, silk, or purple.

From the Romans the dragon came to the Western Empire, and was long in England the chief standard of the kings and of the

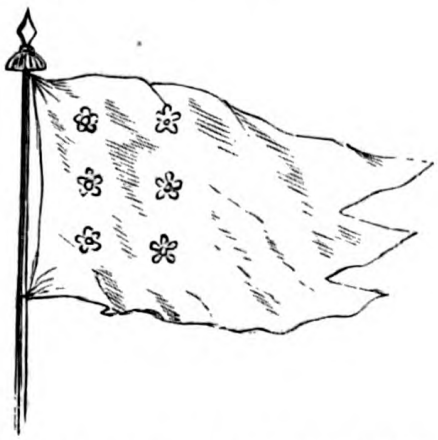
BANNERS OF THE TENTH CENTURY.

dukes of Normandy. Matthew Paris notes its being borne in wars which portended destruction to the enemy. It was pitched near the royal tent, on the right of the other standards, where the guard was kept. Stowe adds that the dragon standard was only used when it was an absolute intention to fight, and "a golden dragon was fixed, that the weary and wounded might repair thither, as to a castle, or place of greater security." The ensigns carrying the dragon standards were designated by massive gold collars which were worn about their necks.

Pinnæ, or aigrets of feathers of different colors, were also used, intended as signals or rallying-points. Representations of animals also, fixed upon plinths perforated with holes, are found, and were evidently ensigns intended to be placed upon the ends of spears.



The hand, appearing on the top of Roman standards, was probably an ancient symbol, perhaps of Oriental origin. It is found as a symbol in ancient Mexico, and as the badge of Ulster. And as it is found in some Irish coats of arms, it may have had a Phœnician origin.

At the present day the flag-staff of the Persians terminates in a silver hand, and with the Turks in a silver crescent.

Prescott says, speaking of the ancient Mexicans: "Their national standard, which has been compared to that of the ancient Romans, displays in the embroidery of gold and feather-work the armorial ensigns of the state. These were significant of its name, which, as the names of both persons and places were borrowed from some material object, was easily expressed by hieroglyphical symbols. The companies and the great chiefs had also their appropriate banners and devices, and the gaudy hues of their many-colored plumes gave a dazzling splendor to the spectacle." The national emblem of ancient Mexico was the swan.

The rabbins suppose that the standards of the Jewish tribes were flags bearing figures derived from the comparisons used by Jacob in his final prophetic blessing to his sons. Thus they have Judah represented by a lion, Dan by a serpent, Benjamin by a wolf, etc.

The later Jews were of opinion that with respect to the four grand divisions, the standard of the camp of Judah represented a lion, that of Reuben a man, that of Joseph an ox, that of Dan an eagle; this was under the conception that the appearance in the cherubic vision of Ezekiel alluded to this division. The Targumists, however, believe that the banners were distinguished by their colors, the color for each tribe being analogous to that of the precious stone for that tribe in the breastplate of the high-priest, and that the great standard of the four camps combined the three colors of the tribes which composed it. They add that the names of the tribes appeared on the standards, together with a particular sentence from the law, and were, moreover, charged with appropriate representations, as of the lion for Judah, etc. Aben Ezra and other rabbins agree with the Targumists in other respects, but put in other representations than the latter assign. The cabalists have an opinion that the bearings of the twelve standards corresponded with the months of the year and the signs of the zodiac, the supposed characters of the latter being represented thereon; and that the distinction of the great standards was that they bore the cardinal signs of Aries, Cancer, Libra, and Capricorn, and were also charged with each one letter of the tetragrammaton, or quadriliteral name of God.

BANNER PRESENTED BY THE POPE, EIGHTH CENTURY.

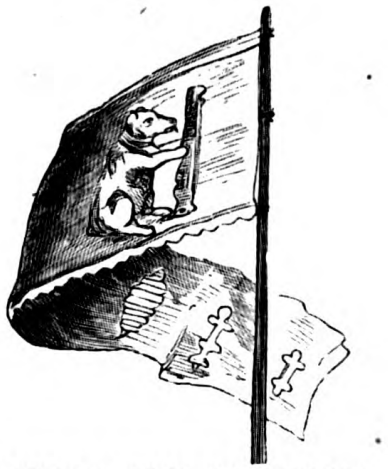
These appear to be the results of rabbinical interpretation. Most modern expositors seem to incline to the opinion that the ensigns were flags, distinguished by their colors or by the name of the tribe to which each belonged. This may, perhaps, be accepted as conclusive, unless the instances we have given from early practice of other nations may lead to the conclusion that flags were not the earliest but the ultimate form which standards assumed. We have in most instances seen them preceded by any object that would serve for a distinguishing mark. The interpretation we have cited is founded on the hypothesis that all sculpture, painting, and other arts of design were forbidden to the Hebrews; but this prohibition is held in doubt by many.



The savages of the Pacific and South Seas make use of distinctive signs. Woven reeds are used for sails, and rushes for streamers, from whence originated the word *flag*.

The waving flag is said to have been introduced by the Saracens, before which time ensigns of war were generally extended on cross-pieces of wood. The flag acquired its present form in the sixth century in Spain. Armorial bearings became hereditary in families at the close of the twelfth century. They took their rise from the knights painting their banners with different figures, and were introduced by the crusaders.

In England the introduction of banners was clearly of a religious origin. Venerable Bede says that when St. Augustine and his companions came to preach Christianity in Britain, in the latter part of the sixth century, and having converted Ethelbert, the Bretwalda of the Anglo-Saxons—his queen, Bertha, having already embraced the Christian faith—the monk and his followers entered Canterbury in procession, chanting, and they carried in their hands little banners on which were depicted crosses. The missionaries were allowed to settle in the

EARLY ENGLISH ROYAL STANDARD.

STANDARD OF RICHARD, EARL OF WARWICK.

Isle of Thanet, and Canterbury became the first Christian Church.

The raven has been regarded from very early ages as an emblem of God's providence, no doubt from the record in Holy Writ of its being employed to feed Elijah the prophet in his seclusion by the brook Cherith; and it was the well-known ensign of the Danes at the time of their dominion in Britain. In the year 742 a great battle was fought at Burford, in Oxfordshire, and the golden dragon, the standard of Wessex, was victorious over Ethelbald, the King of Mercia. The banners of several of the Saxon kings were held in great veneration, especially those of Edmund the Martyr and of Edward the Confessor. The latter king displayed as an ensign "a cross fourchée between five martlets of gold," on a blue field, and which may still be seen on a very ancient shield in the south aisle of Westminster Abbey. When William the Norman set out to invade England he had his own ensign, the two lions of Normandy, depicted on the sails of his ships; but on the vessel in which he himself sailed, besides some choice relics, he had a banner at the mast-head with a cross upon it, consecrated by the pope, to give sanctity to the expedition. Indeed, it has been the practice in every age for the pope to give consecrated banners wherever he wished success to any enterprise, numerous instances of which might be cited in very recent times. And in the British army, down to the present day, whenever any regiment receives new banners, it is customary to draw the regiment up in line, and, in the presence of officers and men, bless the new colors with prayers, which are offered by clergymen of the Church of England; the colors are presented to the regiment by the hand of a lady of rank.

With the crusades, when heraldry began to assume a definite form, flags became subject to established rules. Up to that period

FRENCH EAGLE.

they were generally small in size, and terminated in three points.

Up to 1340 the royal standard of England was charged with three lions, *passant-gardant* in pale; and in that year Edward III. began to bear the arms of England and France quarterly. In the twelfth and thirteenth centuries mention is made of standards conveyed on a car drawn by horses. The "Battle of the Standard," in 1138, was so called from the "car-standard" which was brought into the field by the English. It was formed of a long pole placed on a car, having at its summit a silver *pix* containing the Host, and beneath three banners—those of St. Peter, St. John of Beverley, and St. Wilfred of Ripon.

Ossian mentions the standards of the kings and chiefs of clans, and he says that the king's standard was blue studded with gold, having on it the figure of a white horse. These standards were generally mounted upon a car drawn by horses, like the Persians. This kind of standard was of Asiatic origin, and adopted by the Italians, and subsequently introduced by Stephen. The standard of Stephen was fixed upon a staff surmounted by a cross *pattee*, "wide at each end, and the small branches projecting outward."

JAPANESE STANDARD.

The imperial standard of England was first hoisted on the Tower of London and on Bedford Tower, Dublin, and also displayed by the foot-guards on the union of the kingdoms, January 1, 1801. This event, it is said, gave rise to the appellation of "Union-jack," which has since characterized the English standard; but the origin of the term "jack" has had many disputed authorities. During the time of the crusades it was applied to St. George's cross on a white field, which the soldiers wore over their armor both on the breast and back. In the English treaty with the Dutch, entered into February, 1673, it was agreed "that all Dutch ships, whether ships of war or others, whether a squadron or single ship, which shall happen to meet any ships or vessels whatsoever belonging to the King of Great Britain, whether one or more, carrying the king's flag, called *the jack*, in any seas from Cape Finisterre to the

CHINESE STANDARD.

middle point of the land Van Staten, in Norway, shall strike their top-sail, and lower their flag in the same manner and with like ceremony of respect as has been usually paid at any time or place heretofore by Dutch ships to those of the King of England or his ancestors."

We read of a *white banner* that was carried in the army of the kings of England in their wars against Scotland. The manor of Shorne, in Kent, was held *in capite* under it.

The "cross of St. George" has been the badge both of kings of Britain and the nation from the time of Edward III. Its use was for a while nearly superseded by the "roses," but revived upon the termination of the wars between the rival houses.

The banner of St. George was white, charged with the red cross; while the British ensign is red, with blue cross in the upper inside corner.

The "Blue Blanket" of Scotland has a local history of no little interest as a famous

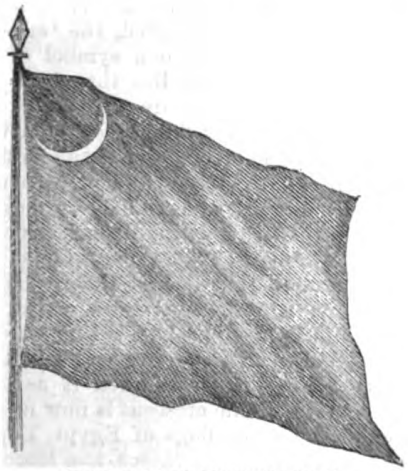
THE LIBERTY FLAG OF 1775.

STANDARD OF EARLY AMERICAN CRUISERS.



standard. In 1482 King James III. presented this standard to the trades of Edinburgh, "as a perpetual remembrance of their loyalty and bravery, with power to display the same in defense of their king, country, and their own rights." This standard was kept by the convener of the trades, and on its appearance, Maitland says that "not only the artificers of Edinburgh are to repair to it, but all the artisans or craftsmen within Scotland are bound to follow it, and fight under the convener of Edinburgh." It was borne by the craftsmen at the battle of Flodden in 1513; and displayed for the purpose of assembling the incorporated trades to protect Queen Mary after her surrender to the confederated nobles at Carberry Hill.

The "Blue Blanket" was brought out on the occasion of the rescue of James VI. from a rabble that assailed him in the old Tolbooth for refusing to listen to a petition presented by the Presbyterian ministers. The standard has been carefully preserved, and is still held in great honor and reverence by the burghers of Edinburgh, and indeed by all Scotland.

The flag of the Covenanters of Scotland was first unfurled in 1638, and was displayed at the battle of Drumclog in 1679, and at "Bothwell's Bridge" in the same year. This old emblem, which is cherished with peculiar reverence by the Scotch people, is preserved by the Antiquarian Society of Edinburgh.

From the twelfth to the fifteenth centuries the chief standard of the French was the famous "Oriflamme," which figured conspicuously in the history of the nation at that period. It is described as a "square banner of flame-colored silk," and is spoken of by Guillaume as follows: "The Oriflamme is a banner made of silk stronger than gimp. It is a flaring sendal, and that simply without any figure upon it."

The origin of the French tricolored flag is set forth in the following explanation: "The immediate occasion for adopting the blue, white, and red, constituting the French tricolor, is said to have been that they were the colors worn by the servants of the Duke of Orleans, and they were first assumed by the people when the minister Necker was dismissed in 1789." But these colors in com-

PINE-TREE FLAG AT BUNKER HILL.

bination appear to have been formed by uniting the three colors successively used in the French standards at different periods, viz., the blue of the banner of St. Martin, the red of the Oriflamme, and the white of the white cross supposed to have been assumed by Philip of Valois. The three colors were given by Henry IV. to the Dutch on their desiring him to confer on them the national colors of his country, and they have been since borne successively by the Dutch republic and the kingdom of the Netherlands. The domestic livery of Louis XIV. was tricolored, as were also the liveries of the Bourbon kings in Spain. At the Revolution they were borne in the same order as the Dutch, but in a different position, viz., parallel to the flag-staff, whereas in the Dutch flag they are at right angles with it.

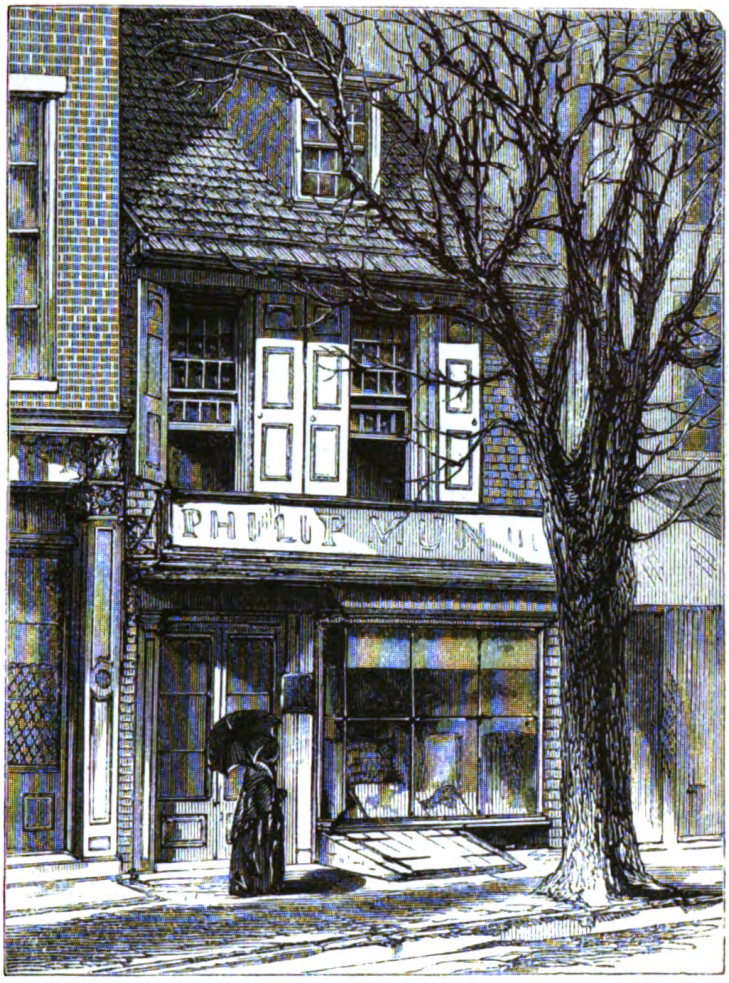
The eagle used in the French armies at this day as a regimental standard is wrought from pure gold, and valued intrinsically at about two thousand dollars each. The ribbon attached is of silk, five inches wide, three feet long, and richly embroidered. It was introduced into the French army by Napoleon I., but after his fall it was abandoned, and again adopted by Napoleon III. This standard was a conspicuous feature in the late war, and proved to be a much-coveted prize among the German soldiery, who, it is claimed, captured nearly two hundred of them in the disastrous successive defeats of the French.

BUNKER HILL STANDARD.

In adopting the eagle as a standard the French have perpetuated the old Roman spirit, which attached great adoration to this proud bird, and so closely allied the eagle to the military destinies of that nation. The Romans are said to have adopted it from the Etruscans, at which period the eagle soared above the greater part of the then known world. As a symbol of daring and defiance it has ever been foremost, and, as such, it has symbolized the American republic from its earliest history. In Job it is written of the eagle, "Where the slain are, there is she;" and the poet has sung, "The eagle shook destruction from its plume on nation, throne, and king;" and Salathiel, "The Roman bird, grasping the thunder in its talons,

FLAG ADOPTED BY CONGRESS, 1777.

and touching with one wing the sunrise, and the other the sunset, casts its shadow over the world."



Regarding the crescent, employed as a national emblem, we have the following account: "As is well known, the crescent, or, as it is usually designated, the 'crescent montant,' has long been a symbol of the Turkish empire, which has thus been frequently styled the 'Empire of the Crescent.' This symbol, however, did not originate with the Turks, for long before the conquest of Constantinople the crescent had been used as emblematic of sovereignty, as may be seen from the still existing medals struck in honor of Augustus, Trajan, and others; and we are assured that it was the symbol of Byzantium. On the overthrow of the empire of Mohammed II., the Turks, regarding the crescent, which every where met their eyes, as a good omen, adopted it as their chief bearing." The crescent is now used as an emblem on the flags of Egypt, Tripoli, Japan, Turkey, Arabia, Mecca, and Morocco.

The Russian and Austrian standards, and that of Prussia, retain the eagle as a symbol of sovereignty. The Russian double-headed eagle is the Byzantine bird. The Prussian eagle is single-headed. On each of the standards of Russia, Prussia, and Austria the eagle is black and displayed on a yellow or golden field. The Russian eagle holds a sceptre in its right talon and a globe in its left; the Austrian eagle is reversed in this particular.

The Poles at one time displayed a white eagle on their standard, but its career was of short duration, as its three black adversaries combined to destroy it.

The "Gallic cock" was displayed in France during the reign of Louis Philippe as the sovereign bird of the nation.

HOUSE WHERE THE FIRST AMERICAN FLAG WAS MADE.

The emblem of the Mexican republic is an eagle and cactus, commemorative of an incident in the early history of the Aztecs.

The American standard, the emblem of the leading republic of the world, has for nearly a century commanded the homage of nations throughout the globe.

Its history embraces many interesting facts and stirring incidents connected with the early days of the republic and the American colonies.

The colonies, up to the Revolution, in allegiance to the mother government, retained the standards of the old country, with the addition of some local emblem which was thereon inscribed as a distinctive feature. Massachusetts adopted the pine-tree, which device was placed on the coins as well as flags used by that colony. But not until the period approaching the Revolution does there seem to have been any attention paid to the subject of independent standards by the several colonies.

The colony of Connecticut adopted, July 1, 1775, this motto, which was inscribed on its standards and drums, "*Qui transtulit sustinet*," which was construed as follows—"God, who transplanted us hither, will support us."

In March, 1775, a "Union flag," with a red field, was displayed at New York on a liberty-pole, bearing the inscription, "George Rex, and the liberties of America;" and on the reverse, "No Popery." Frothingham says this flag was also displayed on the liberty-poles and on the famous liberty tree on Boston Common.

About this time a standard was adopted for the thirteen colonies combining the crosses of St. George and St. Andrew, *with thirteen stripes, alternate red and white.* (The banner of St. Patrick, the emblem of Ireland, was not combined with the crosses of St. George and St. Andrew in the standard of Great Britain until 1801, the year of the union with Ireland.)

The first Independence flag displayed in South Carolina was that used at the taking of Fort Jackson, on James Island, September 13, 1775. "A flag being thought neces-

MRS. ROSS AND THE FLAG COMMITTEE.

sary for the purpose of signals, Colonel Moultrie, who was requested by the Council of Safety to procure one, had a large blue flag made, with a crescent in one corner, to be uniform with the troops.

October 20, 1775, Colonel Reed, with the co-operation of Colonels Glover and Moylan, designed a flag or signal to be used by the American cruisers, which was adopted. It is described as a white flag with a pine-tree in the centre, and bearing the motto, "Appeal to Heaven." The London *Chronicle*, an anti-ministerial paper, contains a paragraph, January, 1776, describing a flag of this description captured with a provincial privateer at that time.

"February 9, 1776, Colonel Gadsden presented to Congress an elegant standard, such as is to be used by the commander-in-chief of the American navy, being a yellow field, with a lively representation of a rattlesnake in the middle in the attitude of going to strike, and the words underneath, 'Don't tread on me.'

"*Ordered*, That the said standard be carefully preserved and suspended in the Congress-room."

Several accounts lead to the belief that at the battle of Bunker Hill standards of various devices were used by the patriot army. From one statement we learn that "the Americans displayed a flag with the cross of St. George, the ground being blue, and in the upper corner nearest the staff a pine-tree." Another writer says that Bunker Hill was fought under a red flag, bearing the motto, "Come, if you dare."

On the 14th of June, 1777, Congress took action, viz.: "*Resolved*, That the flag of the United States be thirteen stripes alternately red and white; that the *union be thirteen stars, white in a blue field, representing a new constellation.*" It was also proposed to insert a lyre, about which the thirteen stars were to be grouped, as embodying the "constellation Lyra," signifying harmony. But this suggestion was not carried out.

The blue field was taken from the Covenanters' banner in Scotland, likewise significant of the league and covenant of the United Colonies against oppression, and incidentally involving vigilance, perseverance, and justice. The stars were then disposed in a circle, symbolizing the perpetuity of the Union, the circle being the sign of eternity. The thirteen stripes showed with the stars the number of the United Colonies, and denoted the subordination of the States to and their dependence upon the Union, as well as equality with themselves. The whole was a blending of the various flags used previous to the war, viz., the red flags of the army and white colors of the floating batteries—the germ of our navy. The red color also, which, with the Romans, was the emblem of defiance, denoted daring, and the white purity.

The five-pointed star, from the heraldry

of Holland, France, and Germany, was adopted for the flag, but the designers of the early coinage of the United States made use of the six-pointed star, as found in English heraldic language. The size of the flag of the army is six feet six inches in length, by four feet four inches in width, with seven red and six white stripes. The first seven stripes (four red and three white) bound the square of the blue field for the stars, the stripes extending from the extremity of the field to the end of the flag. The eighth stripe is white, extending partly at the base of the field.

By the United States law of January 13, 1794, it was enacted "that from and after the 1st of May, 1795, the flag of the United States shall be fifteen stripes, alternate red and white," and "that the union be fifteen stars, white, in a blue field." This was our national flag during the war of 1812.

On the 4th of April, 1818, Congress altered the flag by directing a return to the thirteen stripes, as follows:

"Be it enacted, etc., That from and after the 4th day of July next the flag of the United States be thirteen horizontal stripes, alternate red and white; that the union be twenty stars, white, in a blue field.

"And be it further enacted, That on the admission of a new State into the Union, one star be added to the union of the flag; and that such addition shall take effect on the 4th of July next succeeding such admission."

The return to the thirteen stripes was by reason of the anticipation that the addition of a stripe on the admission of each State would make the flag too unwieldy. The old number of stripes, also, perpetuated the original number of States of the Union, while the addition of stars showed the Union in its existing state.

The construction of the first national standard of the United States, as a design, from which the "Stars and Stripes" was afterward adopted, took place under the personal direction of General Washington, aided by a committee of Congress "authorized to design a suitable flag for the nation," at Philadelphia, June, 1777.

This took place at the residence of Mrs. Ross, a relative of Colonel Ross, in Arch Street, between Second and Third, where General Washington and the committee completed the design, and employed Mrs. Ross to execute the work. The house is still standing (No. 239). Mrs. Ross was afterward Mrs. Claypoole. Her maiden name was Griscom, and, according to the fashion of the times, she was called "Betsy."

Betsy Griscom had, before the Revolution, acquired some knowledge of the "upholder" trade, as it was then called—an occupation synonymous with that of the modern upholsterer—and at the time mentioned was carrying on business on her own account in her little shop. One day, probably between the 23d of May and the 7th of June, 1777, during which period Washington was in Philadelphia, there came to her the commander-in-chief, the Hon. George Ross, and other gentlemen, members of Congress, who desired to know whether she could make them a flag according to a design which they would produce. She intimated her willingness to try. The design was for a flag of thirteen red and white stripes, alternate, with a union, blue in the field, spangled with thirteen six-pointed stars. Mrs. Ross expressed her willingness to make the flag, but suggested that the stars would be more symmetrical and pleasing to the eye if made with five points, and she showed them how such a star could be made, by folding a sheet of paper and producing the pattern by a single cut. Her plan was approved, and she at once proceeded to make the flag, which was finished the next day. Mrs. Ross was given the position of manufacturer of flags for the government, and for some years she was engaged in that occupation. The business descended to her children, and was carried on by her daughter, Clarissa Claypoole, who voluntarily relinquished it on becoming a member of the Society of Friends, lest her handiwork should be used in time of war.

IMPROVISATIONS.—VII.

FILL, for we drink to Labor!
And Labor, you know, is Prayer:
I'll be as grand as my neighbor
Abroad, and at home as bare!
Debt, and bother, and hurry!
Others are burdened so:
Here's to the goddess Worry,
And here's to the goddess Show!

Reckless of what comes after,
Silent of whence we come:
Splendor and feast and laughter
Make the questioners dumb.
Debt, and bother, and hurry!
Nobody needs to know:
Here's to the goddess Worry,
And here's to the goddess Show!

Fame is what you have taken,
Character's what you give:
When to this truth you waken,
Then you begin to live!
Debt, and bother, and hurry!
Others have risen so:
Here's to the goddess Worry,
And here's to the goddess Show!

Honor's a thing for derision,
Knowledge a thing reviled;
Love is a vanishing vision,
Faith is the toy of a child!
Debt, and bother, and hurry!
Honesty's old and slow:
Here's to the goddess Worry,
And here's to the goddess Show!

BAYARD TAYLOR.

DOWN BY THE BROOK.

Down by the brook went Effie and I,
Down by the brook 'neath the forest trees,
When the air with the breath of flowers was sweet,
And the long grass swayed in the summer breeze.
The brooklet danced in the sunbeams bright,
And murmured its own sweet song of glee,
While over our heads the merry birds
Were filling the air with melody.

Ah me! I wonder if ever now
Her thoughts go back to that dear old time,
When under the trees alone we sat,
Hearing the ripples' dreamy rhyme?
And dipping her hand in the waters bright,
How lazily she with the ripples played!
And the dimples hid in her soft, fair cheek
As I watched her there 'neath the old trees' shade.

Alas for the vows we plighted then!
Her heart was fickle, and mine was strong:
The love she gave on that summer day
Lasted only the summer long!
Down by the brook, 'neath the grand old trees,
Effie and I no more may go,
And only the birds in their leafy nests
Shall hark to the ripples' dreamy flow.

SICILY AND THE SICILIANS.

STATUE OF PALERMO.

SICILY is at once the largest and most interesting island in the Mediterranean. Its general neglect by tourists might be thought to spring from its similitude in configuration to something superfluous kicked by the boot—Italy—into the sea. Mathematically, it is an isosceles triangle; geologically, it is a profound mystery; historically, it is a fascinating study; actually, it is a land of variegated and bewildering beauty.

The island appears to be an interrupted extension of the Italian peninsula; its natural products also indicate a former connection of the two. Still science refuses to recognize its mountains as a continuation of the Apennines, and there is very little resemblance between it and Africa. A strange land is Sicily, with a strange, eventful history and a singular and superstitious people, Italians by name, but of mixed and mysterious blood. Containing less than eleven thousand square miles, the interior is a high table-land, bounded by ranges descending steeply along the northern and sloping much more gradually to almost open plains on the southern coast. The elevated region is intersected by ridges, rising one above another into lofty mountains, crowned by Ætna's steep. Compared to that, all the other summits of the island are insignificant, the loftiest being from three to four thousand feet, and most of them much less. Where their sides, in consequence of altitude or ruggedness, can not be cultivated, they are covered with fine forests, while between the mountains frequently lie deep and delightful valleys, sometimes stretching out into broad and fertile plains, which yield the charm of variety and unexpectedness to the magnificent landscape. The rivers are numerous, but of such slender dimensions, except at the most favorable season—they are almost dry during summer—that all their classic fame is required to redeem them from contempt. They are prodigal streams, supremely lavish of their possessions at certain periods, and forced to arid niggardliness for the remainder of the year. To them much of the once-renowned fruitfulness of Sicily must have been owing; and even now, though more liable to exhaustion, they continue to stand the country in the same stead.

The position of the island, in the midst of an inland sea, easily accounts for its checkered history. Apart from its early barbaric occupation, the Phœnicians, Greeks, and Romans invaded it, and established themselves there; and in later times the Saracens, Normans, and Teutons had their conquests and settlements on the much-disputed soil. Its varied aspects answer to its

varied fortunes; every square foot of its territory has its myth, its tradition, or its pregnant fact.

The first inhabitants of Sicily, according to tradition, were the Cyclops and Lestrygonians, who, having served the purpose of poetry, passed into the thin air from which they had been evoked. The island was then called Trinacria, from its shape; but after the Sicanians from Iberia (ancient Spain) had gained possession of it, they gave it the name of Sicania. Thê Siculi, expelled from Italy, crossed the strait now known as Messina, vanquished the Sicanians, and baptized the triangle after themselves in their own and their enemies' blood. The Greeks subsequently planted colonies there, and founded Syracuse, Agrigentum, Messina, and other cities. The country was afterward conquered by the Carthaginians, then by the Romans, and later overrun by the Goths, who were in turn driven out by Belisarius. In the ninth century the Saracens gained a firm foot-hold on the island, and kept it until expelled by the Normans. At the close of the twelfth century the cruel Henry VI. of Germany established the Suabian sovereignty, crushed by the French under Charles I., Duke of Anjou, whose reign was suddenly ended in 1282 by that terrible massacre, the Sicilian Vespers.

The princes of Aragon having eventually become the sovereigns of Sicily, they ruled over it until 1516, when it was annexed to Spain by the succession of Ferdinand the Catholic, and held by that power until a popular insurrection gave it to Austria. The Peace of Utrecht assigned the island to Victor Amadeus, Duke of Savoy, who, after four years, returned it to the Hapsburgs in exchange for Sardinia. In 1734 the Austrians were ejected by the Spaniards, and, two years later, by a formal treaty it and Naples were united under the name of the Kingdom of the Two Sicilies. Twenty-five years ago repeated though ineffectual attempts were made by the Sicilians to deliver themselves from the Neapolitan yoke; but Garibaldi, after patriotically liberating them in 1861, generously handed over the fruit of his victories to Victor Emanuel, and the much-chafed and ever-changing island was annexed to the kingdom of Italy, where it naturally belongs, and where it is likely to remain.

It will be some time before Sicily will be invaded to any extent by sight-seeing vandals, and its comparative immunity from them adds to its attraction. Travelers for mere comfort are not likely to be drawn thither, since railways and telegraphs have been hardly begun, and the inns, with few exceptions, furnish bad lodging and worse fare. No one journeying there need fear gout, if he be secure against dyspepsia, and any stranger can sleep soundly in the interior towns, provided he be so thoroughly fatigued as to be insensible to entomic assaults. The taverns outside of the cities make no pretense to good accommodations in the Anglo-Saxon sense, and frequently, after the manner of the Spanish ventas, supply nothing but eggs, bread, and wine, with the rudest and most populous of couches. Several railways are projected, but the only one in running order a short time ago was from Palermo to a point near Messina, to which it will soon be extended. Steamers ply regularly between Naples and Palermo and Messina, and between Marseilles and the latter port, and sail occasionally from the first two cities to Trapani, Girgenti, and Catania. Mail routes are established between the chief towns, for which the usual fare is five bajocchi (nearly eight cents) a mile, with the same amount for the postilion at every relay. Going into the interior often requires mule-back, unless you prefer the *lettiga*—a species of sedan, borne by two of the long-eared quadrupeds to the monotonous music of jingling bells. This is a dull, drowsy mode of getting along, which a person of health and energy will not care to adopt more than once. The back of a strong mule and the aid of a trusty muleteer afford the most satisfactory means of journeying in the mountainous districts. To these a stock of provisions, a tent, and bedding may be added with advantage. They are not indispensable, but they insure independence. Unless you be pachydermatous, you must not forget to provide yourself with a pair of sheets, sewed stoutly together on all sides but one, and drawn with strings like a bag. Into this you must get at night to avoid the swarm of insects which will otherwise devour you. This kind of preparation will seem a little odd at first, and may induce you to dream you are a sack of meal. But if you neglect it you won't be able to dream at all, or even lose consciousness, and, moreover, your body will be certain to present the next morning a striking resemblance to a South Sea Islander's.

The natives never mind the vermin. They are so entirely devoid of sensibility that they would sleep, I fancy, though the vulture of Prometheus made a perpetual breakfast of their liver. But if you be either American or English the Sicilian insects will regard you as a Frenchman left over from the Vespers, and do their very vilest to drain you of the last drop of blood which you ought to have lost at that historic butchery.

I have been told the nocturnal bag will not always protect my countrymen from the tormentors indigenous to the soil, that it has in some instances been eaten up, and in others carried off by swarms of vermin. I am unwilling to vouch for this, at least until it receives corroboration. I frankly confess, however, that ancient Trinacria has as

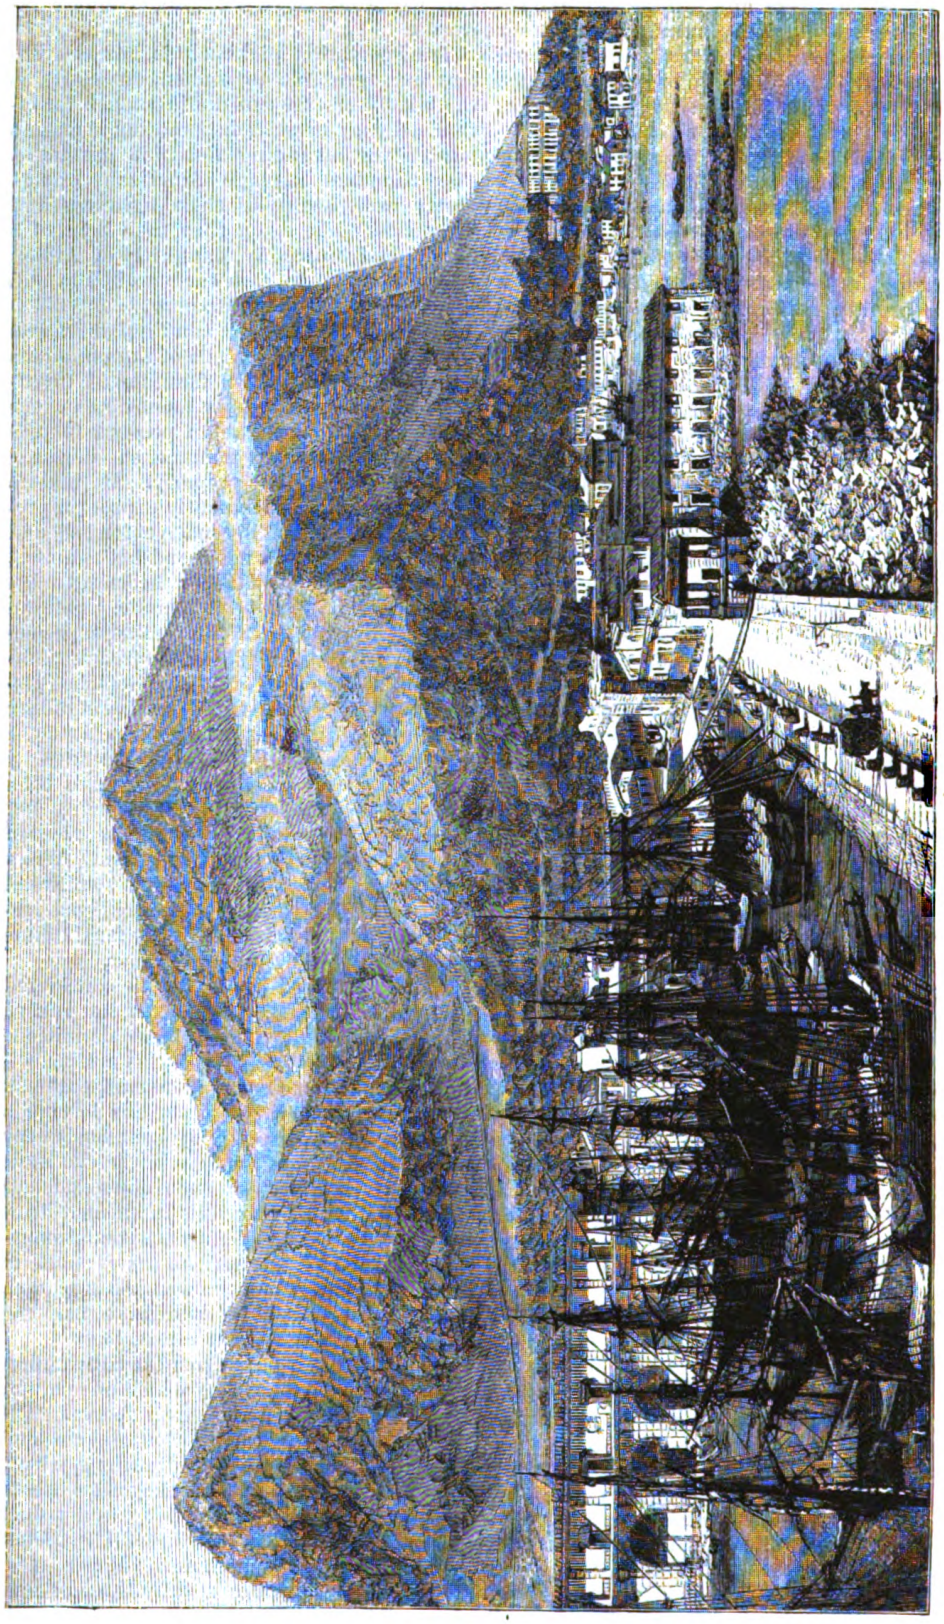
large and regular a crop of fleas, bugs, and biters generally as any territory of like dimensions on the globe, and that, while their infinite number and variety may commend them to the consideration of entomologists, they can not be conscientiously indorsed as conducive to the wayfarer's comfort.

A serious impediment to Sicilian travel is the water-course (fiumana) descending from the mountains to the sea, and liable to be encountered almost any where. It is often impossible to bridge over the fiumana on account of its breadth and rapidity. It runs like a mill-race, bearing in its rushing current a vast mass of stones, broken wood, and miscellaneous fragments. During the summer all the streams, including many of the largest rivers, cease to babble—in the vernacular, dry up. But then hardly any one, last of all the foreigner, is disposed to travel. Apart from the discomfort of a blazing sun and a heat almost tropical, there is imminent danger of malaria, always perilous to the unacclimated, be their prudence or precaution what it may. In stormy weather—and violent storms, often accompanied by thunder and lightning, are common from November to March—you will find your carriage, a quaint and clumsy vehicle, interrupted by one of those shallow torrents. The sole method of progress under the circumstances is to mount upon the back or shoulders of the driver or his assistants, and be carried through the boiling stream. Plenty of aid is usually at hand, as the country people, knowing where their service will be needed, follow your carriage to the fiumana for the sake of earning a few tari.

The Sicilians, as a rule, are indolent, like most of the Southern and Eastern people—the natural effect of their climate; but I have yet to see any order of human beings unwilling to exert themselves when certain of being paid for their exertion.

A droll spectacle to witness is the peasants and postilion tugging at the wheels of the diligencia, up to their knees or waists in water, cracking whips, beating the poor horses—poor in a double sense—and yelling and groaning in every note of the gamut. Any defect of work is requited by noise. Judged by the uproar, every lubber is a Milo in performance, though the extent to which the labor is drawn out evinces the elasticity of the Sicilian conscience. If the vehicle were relieved in a few minutes, as it might be ordinarily, you might think a handful of grain sufficient compensation; but when the better part of an hour is employed, you feel ashamed to offer any thing but carlini, or perhaps tari, for what seems to have been such superhuman toil. The lusty fellows look so spent, too, so perfectly resigned to die in your behalf, when they approach you with moist faces and outstretched hands, that you would appear even to yourself the veriest churl should you withhold largely disproportionate rewards.



Transportation pickback is not convenient nor agreeable to women, especially as the bucolicists are not distinguished for either delicacy or skill in handling feminine burdens or arranging feminine garments. The islanders manage American women pretty well, owing to their lightness and suppleness; but when they take hold of a heavy and unwieldy daughter of Albion they are prone to awkward accidents and surprising disorders of drapery.

I remember a mishap to an English dragon of the feminine gender, one of the numerous family so unpleasantly familiar to Continental wanderers. After mounting on the broad back of a Catanian peasant for the purpose of crossing a fiumana, she declared he did not carry her properly. He had no conception of her vehemently expressed protest, which was in her native tongue, and consequently he did not mend his manners. Thereupon she struck her heels into his sides as if he had been a mule. Sicilian blood is hot, and the Sicilian mind supremely sensitive to the slightest approach to insult. The conveyer of Queen Victoria's plethoric subject fired at once, and pretending to stumble, threw her over his head into the stream. She was borne some distance by the strong current, and would have been drowned had not her bearer, deeming her punishment adequate to her offense, rescued her in a semi-insensible condition. When recovered she would not have swallowed her wrath if the water had not enjoyed precedence, and fairly washed away for the time all traces of her impetuous temper.

The climate of the island is considered pleasant and healthy. I should not regard it so, though I may have esoteric definitions for those adjectives. The skies are beautifully blue, and the atmosphere transparently serene in summer, when persons having a prejudice in favor of living sedulously stay away. Autumn is thought to be the most propitious season; but then dews and fogs predominate, and rain falls in sheets. Terrible tempests are varied by occasional snow-squalls in January and February; and in April and May, when the weather is settled, the heat begins to be oppressive, and the dreaded sirocco blows at intervals.

This southeast wind from the Libyan deserts is a pneumatic misery which no one who has once endured it can ever forget. The natives fear it, believing that disease and death are borne upon its burning wings. The moment they feel it they shut themselves in their houses, closing every door and window against the hateful intruder, and seldom venture forth until it has abated. The sirocco continues usually three or four days. If it were to last much longer it

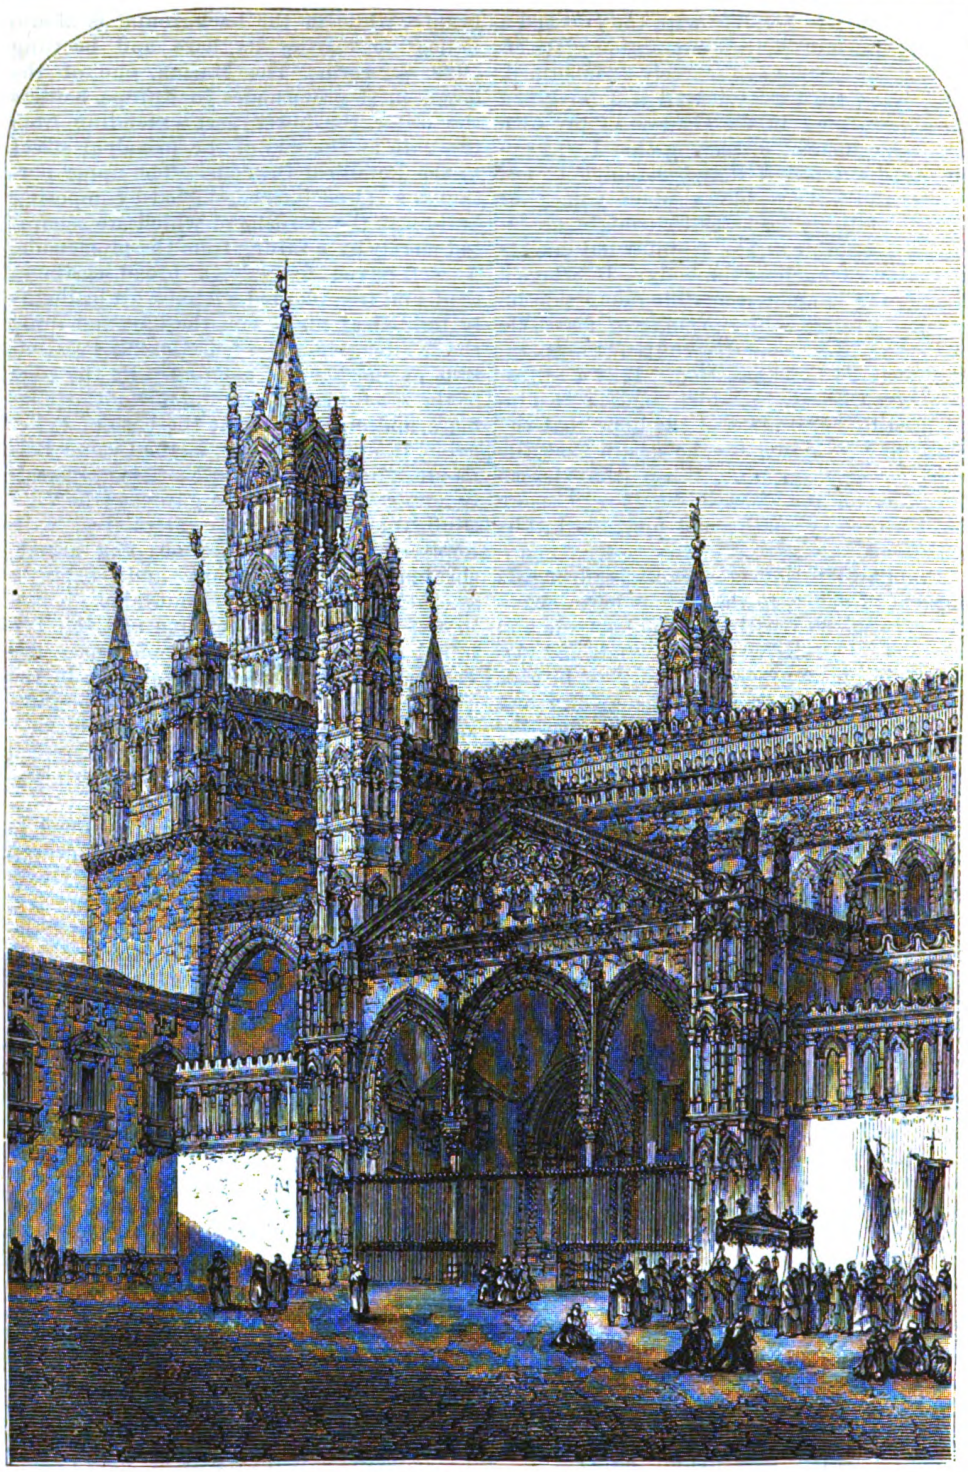
would interfere severely with the two and a half millions of Sicily's population. Its effect on the system can scarcely be imagined. The first time I experienced it I imagined myself walking in the shadow of my own funeral. Instead of fearing that I was going to die, I feared that I should not; for, while the sirocco blows upon you, your speedy obituary seems as if it might be delightful reading. The woful wind affects the mind as much as the body. It brings a distressing languor, a terrible depression of spirit, a strange voluptuousness of insensible pain, a vivid consciousness of rising desperation fettered by exhaustion. It is a terrestrial seasickness, in which nausea is supplanted by lassitude, and the hope that the ship may go down by the desire that the sufferer may go up. When the sirocco breathes on my dearest foe it will make me, through sympathy and pity, his bitterest friend.

From April to November excessive droughts prevail in Sicily, to the serjous harm, sometimes to the destruction, of the harvests and vintage. Thus between high winds and violent rains, heavy fogs and tempests, intense heat and the sirocco, ruinous aridity and deadly malaria, alternating one with the other the year round, a very slender margin is left for fine or salubrious climate. By way of amends for these, the island is subject to volcanic eruptions, water-spouts, hurricanes, and earthquakes, which are periodically active in diminishing the census, and revealing to native superstition the immediate supervision of an offended Deity. Recently a terrible hurricane nearly destroyed the town of Palazzuolo, and at Palermo and in every part of the country great loss of property and life has occurred from time to time through the fury of the elements. If the Almighty smites what He loves, Sicily must be one of the most dearly cherished of all His affectionately inflicted possessions.



Whatever the climate and hygienic qualities of the island, no one, after visiting it, will deny its picturesqueness, its manifold attractions, its sovereign claim to beauty. It has charms of its own that even Italy, land of loveliness, can not boast. Blending Grecian ruins with delightful scenery, Norman architecture with Byzantine and Saracenic forms, stately cathedrals with majestic aspects of nature, it addresses itself simultaneously to the archæologist and artist, the lover of the antique and the novel, the scholar, the philosopher, and the poet.

Palermo, the capital and metropolis of Sicily (population about 200,000), is naturally the first point of visitation. In a rich plain, surrounded on the land side by two distinct mountain ridges, its situation is admirable, its bay being regarded by its inhabitants as the equal of the bay of Naples. The sea stretches before the city in blue beauty, while in the background is Monte Pellegrino rearing its bare and beetling cliffs skyward. The Marina, one of the handsomest promenades in Europe, borders the water, the lower part extending from the gate at the end of the principal street to the Botanical Gardens. The upper portion is a raised terrace, skirted by imposing buildings, the gardens of which are separated merely by a railing from the promenade. A well-paved footway, a broad carriage-road, and tree-planted avenues, all brilliantly lighted at night, rim the bay, and draw the fashionable and leisure-loving Palermitans at the hour of evening. By the edge of the sea frowns the strong fort of Castellamare, and on the spur at the base of Pellegrino, in sharp contrast, is the Casino Belmonte, a noble villa, whose site is universally admired. The public gardens (the Villa Giulia) are exceedingly attractive, with fountains and kiosks, statues and arbors, shrubbery and choice plants, and constantly sought by sight-seers. Fountains abound in the city, those of Neptune and the Tribunal among the most conspicuous. The Fountain of the Statue of Palermo, in the Villa Giulia, is an elaborate work, representing a crowned figure, an eagle at its side, with divers symbols, which are understood by the citizens in a way very flattering to their municipal vanity.

The Greco-Gothic cathedral, assigned to the tenth century, though the incongruous cupola is plainly modern, is superlatively ornamented, and the south porch remarkably rich. Its porphyry monuments, particularly those of the Emperor Frederick II. and King Roger the Norman, are singularly interesting. The crypt of the cathedral is noticeable for its dwarf pillars and intersecting Gothic arches. Of its twenty-four tombs the most prominent are that of Archbishop Frederick of Antiocha (bearing the effigy of an armed warrior) and the sarcophagus of the founder, Gualterio Offamilio. Among other public buildings are the Palace of the Tribunal, a fine fountain in front; the interesting Church of San Giuseppe, adjoining the old Palace of Charles V., in an open space crowded with statues; the Royal Palace, in the Norman and Saracenic style, massive, though gloomy, a small belfry at the top, and a clock below the cornice, with a striking monument to Charles V. to the left of the pile; the Observatory, where the priestly savant Giuseppe Piazzi discovered the planet Ceres; the Archiepiscopal Palace, the Mint, Public Library, Custom-house, and several theatres. The port is inclosed by a mole, terminated by a light-house and battery, which, with the shipping, are deserving of attention.

The name Golden Shell (Conca d' Oro) has been applied to the space between the hills and the bay of Palermo, on account of its

CATHEDRAL OF PALERMO.

graceful shape. The city, nearly rectangular, and about four miles in circumference, is surrounded by decayed walls, having twelve gates, and protected by bastions. From the sea its numerous spires, domes, and towers give the capital a superb appearance, which is hardly sustained by closer inspection. Two wide streets, the Cassaro (now called the Corso Vittorio Emmanuele) and the Via Macqueda, divide the town into four nearly equal parts. They intersect each other at right angles near the cen-

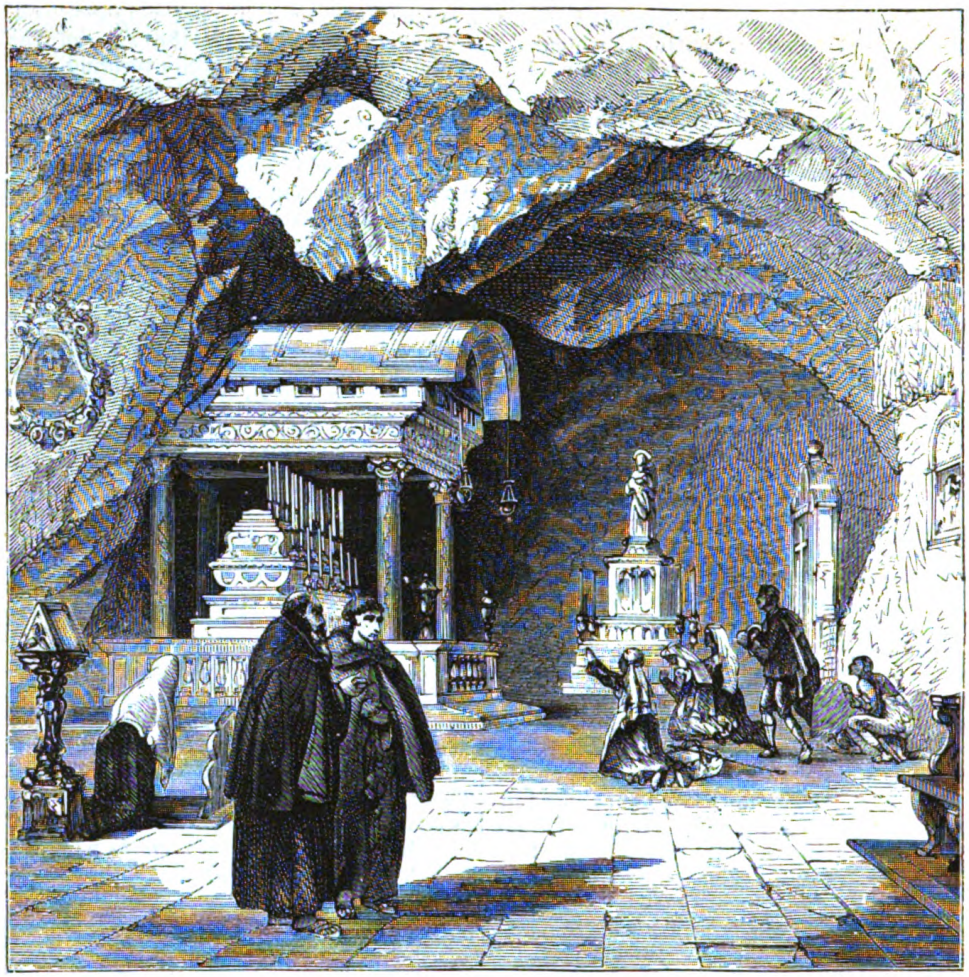
tre of the city, in a large octagonal piazza known as the Quattro Cantinieri, embellished with a fountain and divers statues. Numerous small streets, irregular, narrow, and dirty, run into the two main thoroughfares, which, in common with the rest, are paved with blocks of lava. The houses generally resemble those of Naples, having flat roofs, terraces, and Venetian blinds, and being divided into flats.

One of the most curious churches in Palermo is San Giovanni degli Eremiti, over seven centuries old, and named after a community of Apulian hermits invited by the then reigning monarch to occupy the adjoining monastery. Its crumbling cloister looks even more ancient than it is, and its rounded cupolas would be thought to mark a mosque but for the form of the Latin cross and the spherical apses indicative of the Roman religion. The style of the dome, the peculiar corbels, and other portions of the interior are reproductions of the tombs and mosques of Cairo and Constantinople.



Palermo's principal beauty is in its surroundings. The plain behind the town is one of the richest in the world, and the city is seen to the greatest advantage from the Convent of Santa Maria di Gesù, some two miles distant, at the eastern extremity of the plain. The ecclesiastical edifice on the lower slope of Monte Grifone is almost hidden in aloes, olives, oleanders, pines, huge cypresses, and luxuriant vines, among which are a few date-palms, once plentiful, though now nearly extinct in that neighborhood. Behind the convent, on the side of the mountain, is a small chapel, overhung with ivied rocks and subtended by a gigantic yew. From that point the panorama includes the luxuriant level of Palermo, girdled by its precipitous heights, and the city sleeping in the curved arm of the beautiful bay. Pellegrino, resembling Gibraltar, and flanked by abrupt precipices, looms up grandly and gloomily in the background.

That barren rock is sacred to the Palermitans because it was once, they devoutly believe, the abiding-place of Rosalia, their patron saint. She is reported to have lived and died in a cavern in the mountain, unknown to her noble and wealthy relatives, from whom she had fled when a child in order to embark in the routine business of penance and prayer. She had no motive for her hegira, since she was entirely comfortable and tenderly loved at home. But being in the line of canonization, it was necessary for her either to do something magnificently absurd or lose her chances. After death she remained quiet for nearly five centuries—very extraordinary tranquillity for a saint—and then, during the plague of 1624, she obtained a spiritual interview with one Bonelli, a pious soap-boiler, and informed him she had never been buried. This unimportant fact had escaped her recollection until that moment; but when it was disclosed her mortal remains were collected, and interred with the fullest sacer-

GROTTO OF ST. ROSALIA.

dotal pageantry. Still was she unsatisfied, permitting the pestilence to rage until her dust should be borne with theologic pomp through the town. That final cataplasm to her vanity proved effective. The plague ceased at once, and ever since the citizens have had an annual festival, from the 11th to the 15th of July, in Saint Rosalia's honor. It is a grand occasion. A gayly decorated car, bearing the supposed bones of the therapeutic lady, is dragged through the streets, followed by a long procession of priests, nuns, monks, and all secular and ecclesiastic dignitaries. The most ostentatious services are held in the cathedral, lighted with thousands of tapers, fire-works are burned in the squares in the evening, the shops and dwellings are illuminated, and the entire population surrenders itself to a frenzy of superstition.

The grotto or retreat on Pellegrino in which the fair and high-bred Rosalia is imagined to have dwelt, and which she miraculously revealed to the holy man of soap (his soap became duly sanctified after the divulgement), is about half-way up the mountain, and still a place of pilgrimage. It contains a statue of the saint, by Gregorio Tedeschi, covered with a robe of solid gold. Such a garment would be rather inconvenient for temporal uses, though, trusting the hagiologists, it is quite the vogue in paradise. Another image of Rosalia is mounted on the brink of a precipice, for the benefit of sailors, who, regarding it from the sea, invoke its protection. The amount of good it does is simply incalculable. It can guard mariners admirably, it is said; but, oddly enough, it can not shield itself. About thirty years ago the saint was struck by lightning, though she had been doing nothing but standing there sinless in serene limestone, and so badly impaired as to require restoration.

The most obstinate skeptics may profit by repairing to the shrine—for love of Beauty is a religion of itself—since they can enjoy thence a splendid survey. An excellent causeway ascending the steep by a series of zigzags renders the grotto easily accessible

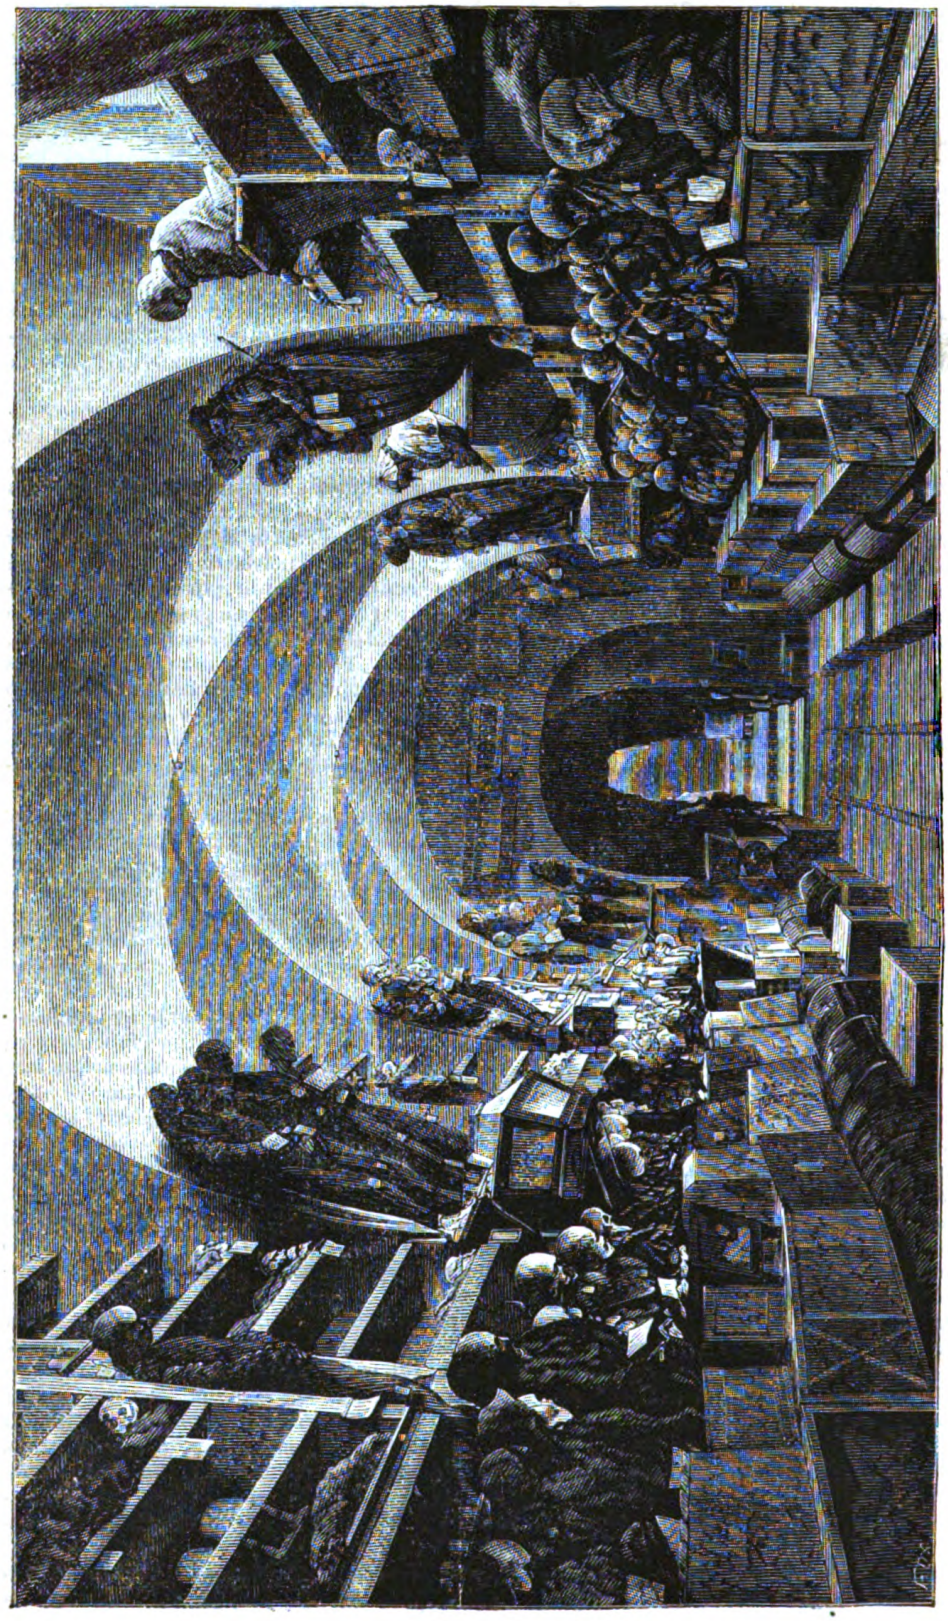
either on foot or by mule. The harbor, the Marina, the greater part of the city, the fantastic mountains encompassing the glorious bay, and the distant coast, melting off toward Bagaria, there meet and magnetize the eye. Immersed in the sunlight, the picture is exquisite, almost a counterpart of the bewitching landscape seen from Sorrento. One need not be an artist or a poet to appreciate it fully. It would appeal to a mathematician, or suffuse with satisfaction the supremest cynic.

On the way back to the city from Santa Maria di Gesù, to the left of the road, is the church and monastery of Santo Spirito, surrounded by cypresses, and memorable as the scene of the Sicilian Vespers. Built seven centuries ago, little of the original structure remains, except the east end, with its pointed windows and interlacing arches.

The bloody revolution known as the Vespers took place on the vigil of Easter. A large number of the native population had assembled for vespers at the church, when some two hundred of their French rulers charged the Palermitans with carrying concealed arms and meditating insurrection. In the midst of the worshipers was a beautiful Sicilian bride accompanied by her husband and a retinue of friends. A Frenchman, Drouet, under pretense of searching for hidden weapons, thrust his hand into the young woman's bosom, whereupon she swooned in the arms of her lord, who, striking the insulter down, exclaimed, "Let us exterminate our oppressors!" The cry, "Death to the French!" at once arose, and the infuriated crowd fell upon the foreigners with clubs and knives, and slaughtered every one of them, Drouet being the first victim. Maddened with blood, the Sicilians, while the bells of the churches were sounding the vespers, and the sky and the earth were kindled with vernal loveliness, rushed into the city, repeating their baleful cry, and inflaming the worst passions of the multitude, and slew whomsoever they could find. The butchery was indiscriminate and terrible. Neither women nor children were spared. The convents were broken into, and every monk of French extraction ruthlessly murdered. No prayers availed, no roof was protection, no altar sanctuary. The massacre extended through the island. The French were attacked in their castles, and threw themselves from the towers and battlements to avoid a more dreadful death. Every human creature who could not pronounce *ciceri* (vetches) in the Italian fashion was revealed as a foreigner, and killed on the instant—a test similar to that reputed to have been instituted by Jephthah to distinguish the Ephraimites from the Gileadites. More than four thousand souls perished in and about Palermo on that single night, Guillaume de Porcelet, a most exemplary gentleman, having been the only Frenchman spared in that hour of awful and revolting retribution.

Cruel and hideous as was the Sicilian Vespers, it was not the result of premeditation or treachery, but a sudden and fearful uprising of an oppressed people against wrong. It struck dismay to tyrants, and strengthened the cause of liberty throughout Europe, while the French long and bitterly remembered the bloody lesson.

When Henry IV., nearly three centuries after, told the embassador from Spain (Sicily then belonged to that kingdom), "If I am provoked, I will breakfast in Milan and dine in Naples," the minister replied, "Your majesty may perhaps arrive in Palermo in season for vespers."



Connected with the convent of Santo Spirito are two vaulted galleries, in which are kept the skeletons of certain noted persons. The anatomies are attired in the garments they wore in the flesh, and exposed in cases and coffins covered with glass. A ghastlier exhibition could not be devised; and as you come suddenly upon it, you are more revolted than if you had been gradually led up to the dismal display. The object is devotional, of course. To wean you from the living it is deemed desirable to disgust you with the dead. What is the good of death, I should like to know, if we are to have our remains rendered repulsive! The skeletons are tricked out in the tawdriest finery, and the contrast between gay clothes and grave plunder would be shocking to a mind not capable of seeing the grim humor of the thing.

On one side is the remnant of an army officer gaudily adorned, his osseous appearance clearly indicating, notwithstanding his fine clothes, that he is in no condition to receive company. Not far away is what was once a woman—sadly out of repair at present—in a "love of a bonnet," the ribbons lying upon her cervical vertebræ, and a fine lace cape inwrapping her clavicle. On the bony fingers of a late (very late) leader of society are white kid gloves, and her tibiæ and fibulæ are covered with embroidered silk hose. Some of the grinning skulls induce you to believe they are enjoying the drollery of the situation, and intimating by a silent chuckle that they are vastly better off than the spectators.

The Sicilians never suspect that their show is funny; and I question if its comic element would be detected by any one but an American. Palermo is not the place for it. It ought to be removed over here. It would draw in Sacramento or San Francisco, and large bets would be taken on the relative ugliness of the different skeletons, leaving the question to be decided by the gentlemen in the coffins.

Several of the feminine departed may suggest other decayed ladies, who not only refuse to be buried, but try to hoodwink you

CATACOMBS OF THE CAPUCHIN CONVENT, PALERMO.

Digitized by Google
Original from UNIVERSITY OF MICHIGAN

by pretending they are still young. They may insinuate they are the counterfeits of animated social antiques of your external acquaintance, minus their toilet and the artful marvels out of which they are created.

At the Capuchin Convent, on the other side of Palermo, near the Zisa Palace, the mortuary specimens are still more curious. A great many bodies of both sexes are preserved there, having been embalmed after death by a peculiar process, part of which consists of exposure to running water for several months. Every monk of St. Francis who has died in Palermo is deposited in those gloomy vaults, the light falling from small upper windows across the groined arches. The ghostly friars are dressed in the habit of their order, and either laid away on shelves, or fastened against the walls in upright position. There is an air of dreary sportiveness in the desiccated old fellows which they never suspect. Some of them wear their hoods, and others are bare-headed, showing the tonsure that marks their priestly office. Death is rarely ludicrous, nor are its surroundings and associations of the sort to inspire mirth. But I defy any man possessing the smallest vein of humor, however unworked, to go through those catacombs and examine the mummified without laughing inwardly or outwardly. The mode of embalming has given many of the monks a decidedly queer and waggish look. They were saturnists in life, and they are involuntary jesters in death. Beyond the grave they lost their gravity; after sepulture they ceased to be sepulchral. None of them are erect—indeed, they incline at as many angles as the houses of Amsterdam—and they are grouped together very grotesquely. A number would serve as illustrations of different stages of ebriety, from the flush of elevation to staggeringly stupid intoxication. They lean on one another after the manner of incapacitated topers, they pitch forward, they stretch backward like monastic Toodleses, and you expect every minute to hear them ask in hollow tones for a dozen flagons of Lacryma Christi.

About the ecclesiastics who seem sober is a quizzical atmosphere. Some of them appear to look at you with a wink and a drawn expression of the mouth, as if they were exploding with a joke they were debarred from repeating.

Near the entrance an old fellow, who must have been a jolly dog in his day, impresses you as the repository of endless capital stories that he will tell the moment you are left alone with him.

A slender friar with a big head might be a learned archæologist full of a new theory. His hood, resting on his occiput, and the twist of his neck convey the impression that he is thinking profoundly, and afraid somebody will guess his thought.

An embalmed pair show like talkers, one of them, as usual, doing the greater part of the talking. The listener has weariness and the struggle for patience stamped upon his wrinkled visage. He must, like Narcissus, have been killed by a bore.

The catacombs are occupied by the bodies of worldlings too, though the well-preserved brothers are the chief attraction. The corpses are either numbered or ticketed, like articles at cheap auctions, many of the attached cards bearing the names of the defunct. The price of places varies with the position, though women, for some mysterious reason, are charged twice as much as men—perhaps because their clothes take up so much more room. The women are exposed in glass-lidded coffins, as at the Santo Spirito, always in their best raiment, the thought that they would be so attired yielding consolation to their last moments. Not a few wear their bridal robes—whether because they had been newly wedded or because those were the finest of their garments can not be conjectured. Some of the bodies have been there for centuries, and their retired spirits belonged to men of mark.

The King of Tunis is on exhibition, among other historic characters. Having been shipwrecked on the coast of Sicily, he was rescued by the Franciscans, and taken to their convent, where, having died from exhaustion, they claimed him as their own. It is not every day they can get a monarch into the order, and it was very natural they should make the most of the royal Tunisian.

To stimulate the flaccid affection of surviving kinsfolk, and prompt further outlay in masses for the repose of souls, small pictures of spirits in purgatory praying to the Virgin for release are ingeniously distributed through the catacombs. The sufferers are often made in the likeness of the dead, so that there can be no lack of directness in the suggestion. One of the monks acts as guide to sight-seers for a fee (fees are required every where in Sicily, though they need not be large), points out and comments upon his dead brothers with great gusto, and shows the spot he has chosen for himself. The Southern nations find a morbid pleasure in looking at and keeping the dead in all their repulsiveness, instead of putting them out of sight, as is the Northern custom, and embalming them in the ideals of recollection.

To return to the city. The Palermitans are emphatically pleasure-lovers, and get great satisfaction out of trifles. The upper classes have much the same, though not nearly so many, amusements as the Neapolitans. Passionately fond of music, the theatre, and spectacles of every sort, their home is under the sky, and domesticity and privacy, in our sense, distasteful. Every pleas-

SICILIAN TYPES AND COSTUMES.

ant evening they flock to the Marina, the Flora, the Garibaldi, and other gardens, smoke, take ices and wines, gossip, dance, practice the arts of gallantry, and torture ingenuity to bury time. They prefer show to comfort. If they can appear well in public, and display themselves in a handsome equipage, they are willing to dispense with any number of conveniences. You will frequently see persons sumptuously attired coming out of mean lodgings, before which a splendid carriage waits. After advertising their state they will ride back to poor provender and untidy apartments, satisfied with the performance of a high social duty. Poor noblemen let their best apartments (piano nobile) and dwell in dingy back-rooms in order to sustain an outward pretense.

Love of inflated titles is a weakness, and on no account must one of them be missed. Where they do not exist, they are often assumed, even shop-keepers sometimes addressing each other as "gracious Sir," and "most illustrious merchant." Compliments —more properly, fulsome flatteries—are constantly exchanged between persons of position. The extent of the impregnation of the atmosphere with garlic from such cause is beyond estimate.

The common people are generally ignorant and indolent, very poor and very superstitious, easily amused and aroused, cheerful and gay, though excitable and revengeful. They are darker than other Italians, shorter in stature, more inclined to take offense. They have touches of the Spaniard and the Arab in their nature, and many of them, from their extreme swarthiness, their large noses, and heavy faces, would be mistaken for Israelites. They delight in gambling; a grano won by fortune yielding them more satisfaction than a tarì earned by work. They have so little money—the American notion of extreme poverty would convey to them luxurious wealth —that they play games of hazard for beans, buttons, and bits of macaroni. They would starve here on five times their wages; but there the climate is milder, and circum-

stance less exacting. The sunlight, a bottle of oil, a pound of macaroni, a few rags, and a pint of wretched wine—far inferior to the worst casse poitrine of the Quartier Mouffetard—constitute contentment.

The contrasts of Palermo exceed those of other cities of Southern Italy. Even the Corso's stately buildings have shops in the basements, often squalid in keeping and unsavory in effusion. The handsome portals, surmounted with coats of arms, are marred by slips of coarse paper, announcing apartments to let, with other dingy appurtenances. The overhanging balconies, where you try to imagine lovely signoras wooing the evening with their lute-like tones, are garnished with lines of family linen or festoons of prosaic provender.

All along the thoroughfare from the highest stories extend ranges of heavy overhanging galleries, inclosed with lattice-work. These belong to the numerous nunneries and monasteries (much reduced since the unification of Italy) which add to the gloomy appearance of the city. They are great shadow-casters architecturally as well as socially. A man of artistic and sensitive organization can almost feel a cloister before he sees it. Altogether unnatural, its cause and effect proceed from blight. Like sterility in the midst of fertility, or pestilence swooping over health, it betrays violation of order, contradiction of law. From the balconies of the convents may be seen not infrequently the pale and peering faces of the nuns, curious about the world they have quitted, and which flows and frets and dashes in the busy street below. A broad entrance to the building, having a number of grated openings, through which the "brides of heaven" talk to their relatives and friends, is styled the parlatorio. There congregate also the numerous dependents of those establishments, who feel, or feign, a degree of reverence for the recluses that is humiliating to witness. Among the visitors are not a few of the decrepit and invalid, who, though the recipients of material charity, have still greater spiritual needs. Satisfied with crusts of bread, they want whole loaves of incorporeal food. They hobble through the world, and indulge their senses, leaving their souls to the care of priests, and praying periodically on their own account for the intermediate state of purgatory.

The ground-floor of the houses in the Corso and other streets is usually appropriated to cafés or shops. Many of the loungers about the former are soldiers and priests, both inclined to the discussion of very secular subjects, to the consumption of wine, and the fumigation of tobacco. Mechanics and tradesmen exercise their callings on the footway—the Sicilians are Zoroastrians in practice, though not in creed—without regard to pedestrians, who are forced into the main thoroughfare amidst a crowd of donkeys and horses, carts and conveyances of every sort. The result is a generally chaotic movement, in which wheels and women, mules and men, carriages and children, are densely intermingled, added to a shouting, racket, and uproar that revive memories of Broadway. Drivers of vehicles scream at every individual in the surging mass, and, in spite of naturally soft and pleasant voices, at such a shrill pitch that you clearly trace their treble above the bass and baritone of the promiscuous chorus. Every body is good-natured, and nobody is run over. A Palermitan prides himself upon his dexterity in avoiding horses' feet and carriage wheels as much as any New Yorker does; and if he seems to miscalculate chances, you may be sure he has just been to the confessional, and believes his shrived soul has better prospects for the future than it may ever have again.

The Sicilians are as thirsty a race as the Spaniards. They drink like Pantagruel. Though they prefer wine, they take water in vast quantities, because it is so much cheaper. They swarm about the showily decked water stalls, usually at the street corners, and exchange small copper coins for large draughts. The water, deliciously cooled with snow from Ætna, is well worth the little charged for it, because it is far more palatable to a cultivated taste than the common wines of the country.

Beggars used to be almost as common as fleas in Palermo, and they are still in superfluous activity. The establishment by a benevolent nobleman some thirty-five years ago of a mendicant asylum has materially diminished professional alms-seekers; but the members of this annoying fraternity would much rather follow Zingare habits, precarious though they be, than be cared for methodically. The beggars of the capital seize every occasion to solicit strangers, whom they recognize afar off, and often demand carlini while you are struggling to extricate yourself from a suddenly contracted space, bounded by the rear of a mule and the fore-feet of a horse.

Palermo, like other cities and towns of the island, has an immoderate quantity of titled families. A proverb of the country says, "Every Sicilian not a woman or a priest is a marquis or a count." But even this is not comprehensive enough, for the inmates of San Martino, a spacious monastery outside the walls of the metropolis, are all of noble extraction, and only such are admitted to the order. Primogeniture is rigidly adhered to throughout the land. Consequently the younger sons, forbidden to marry out of their rank, and too vain (let us forever cease to dignify such meanness by the name of pride!) to attempt to sup-

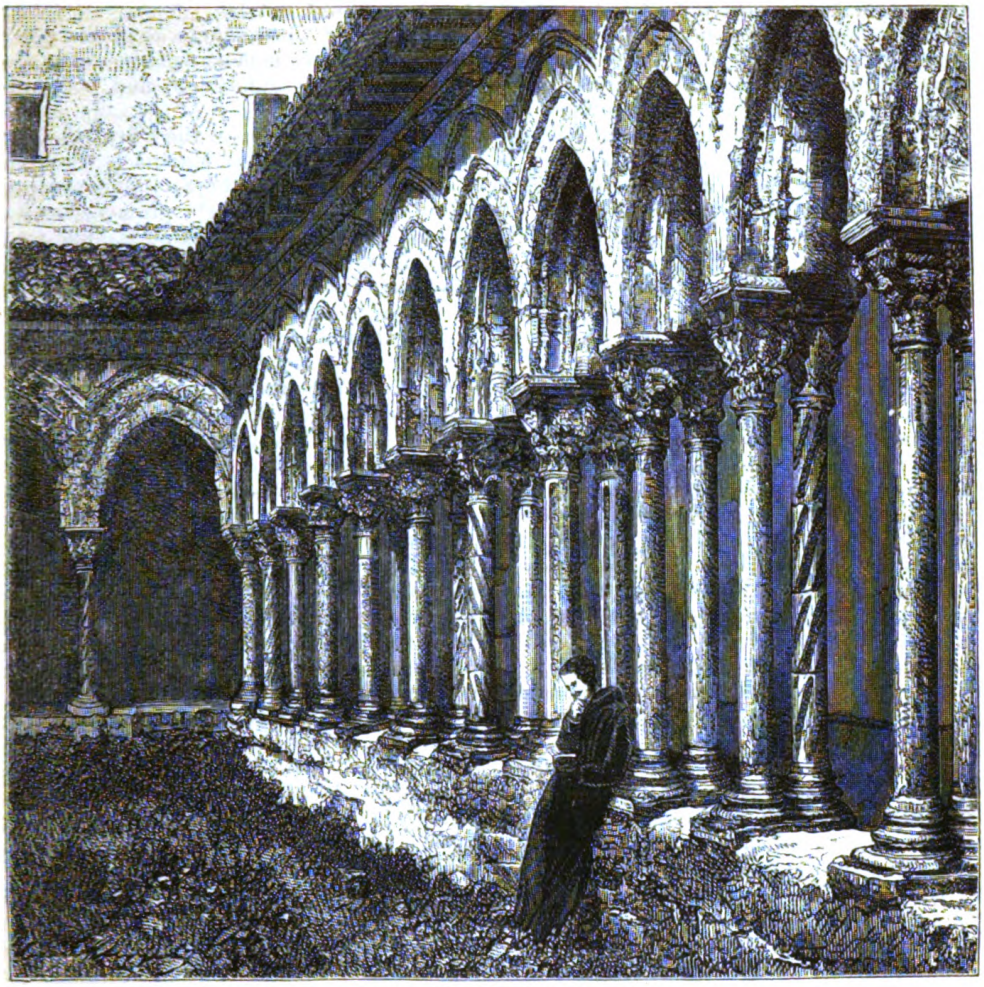
port themselves by their own industry, become drones and burdens on the community. They verify the adage, "An idle brain is the devil's workshop," by falling into dissolute habits, and committing offenses which would consign them to prison but for their distinguished connections. Gambling, dueling, tippling, and wenching are their pastimes, with spasmodic comprehensions of their unworthiness, which naturally, if not properly, lead to suicide.

The law is a favorite profession in Palermo and elsewhere. The Sicilians are of a very litigious spirit, as may be inferred from the fact that there are nearly four thousand advocates, solicitors, and notaries in that city, fully one-fiftieth of the entire population. The number is lessening, however, as the island grows in prosperity, and the people (slowly) emancipate themselves from ignorance and superstition. The influence of the new order of affairs in Italy—notably the deprivation of the Pope's temporal power—is unquestionably beneficial, and the social health of Sicily gradually but steadily improves.

Fishing is an important industry in Palermo. Some five thousand of the inhabitants are engaged in it, and they are formed, it is said, into a regular corporation, having, besides officers, surgeons and chaplains and a semi-military government. The principal fish caught is the tunny, much relished by the Palermitans, as it was by their ancestors the old Romans, Greeks, and Carthaginians. Very large, weighing a thousand pounds frequently, it is sold after being cut into steaks. It is the cat-fish of the Mediterranean, and its exposure in slices and its eager purchase remind one of similar scenes in the towns along the Mississippi. The tunny is gregarious—enters the Mediterranean in shoals early in the year, and is caught in quantities in large nets, in nearly the same manner as by the ancients, during May, June, and July. The Sicilians are reputed to be fond of novelty. Their fondness may arise from their slight acquaintance with it, like the hermit who loved all women because he had never known any. Their mode of taking tunny is an example. They have acquired no new ideas respecting it in two thousand years.



The nets, divided into four communicating square spaces called rooms, are moved east and west about a mile from the shore, each of the spaces at right angles, fastened at the bottom with stones, and floated at the upper edge by logs of cork or other light wood. A single net of very wide meshes fastens the whole to the shore. This arrests the fish, drives them into the outer room (bordonaro), which is raised a trifle and closed by the boatmen keeping watch. Frightened, the tunny, in trying to escape, enter the next room (bastardo), whence, finding no freedom, they dash into the other chambers. In the last (corpo) they stay until it is full—two or three days sometimes—when the net is weighed, and they are dextrously dispatched with hooks and harpoons by the fishermen, who go out in flat-bottomed boats for that purpose.

Going from Palermo through the Porta Nuova, the finest of the twelve gates, over a good road, you arrive at Monreale, four miles distant, to see the cathedral, considered the handsomest in Sicily. There are beautiful views on the way of the luxuriant plain, covered with olive, orange, and lemon groves, bamboos, magnolias, and immense geraniums, interspersed with vineyards and fields of waving corn, vast aloes, and thickets of cactus—flower, foliage, and fruitage almost choking each other. White houses relieve the deep green here and there; rocks and cliffs spring up, as if to protest against the tyranny of enchantment; mountains, rugged and brown, make stern contrasts; the distant domes and towers of the capital laugh back the sunshine, and the sapphire sea caresses the lovely land until, subdued by its fascination, it stretches out, weary and wanton, to dream of its returning joys.

During the Norman reign in Sicily, William II. built the cathedral because the Virgin—in the Middle Ages she was especially engaged in architectural suggestions—had requested him to do so. He employed all the talent he could find, and the result was a very costly and inharmonious, though really sumptuous church. It is Greek, Saracenic, Italian, and Norman—not imposing outwardly, but very rich in its inward variety. In form a Latin cross, it has immense bronze doors, similar to those of the Baptisteria at Florence, massive pillars of different-hued marbles, slightly pointed arches, a flat roof gorgeously carved, and Byzantine mosaics wrought upon a gold ground all over the walls. A single aisle runs behind the nave, the eastern end consisting of three apses, in the central one of which is a colossal head of Christ. Slender pointed windows over the arches admit a subdued light into the cathedral, while the lower part, sunk in half shadow, creates a delightful picturesqueness, and on a bright day produces the most striking artistic effects.

On the south side of the church is the spacious cloister, surrounded by single or coupled columns—the angles have four—supporting small pointed arches of peculiar pattern. The pillars are all different, and all delicately and elaborately ornamented; grotesque heads and figures, flowers, fruits, and battle scenes, being carved on some of the capitals. At one angle, in a square recess, is a marble fountain, with a column ornamented in Saracenic style. The cloister in its general effect recalls the Alhambra and the Cordova cathedral.

CLOISTER OF THE CATHEDRAL, MONREALE.

Many of the villas in the vicinity of Palermo, particularly those at Bagaria, mostly made up of them, are very fantastic in style. Two of these, built by the Prince of Radili and the Duke di Serra-di-falco, have delightful gardens, containing not only statues, temples and fountains, but imitations of ruined castles, broken aqueducts, and moss-grown abbeys. They have also miniature cliffs, artificial labyrinths, and rustic huts containing life-sized automata, which appear as enraged monks or jolly friars, when the doors, connected with wires, are opened by visitors.

You can go from Palermo to Messina by sea, or over the coast road. By the former you get a fair view of the Lipari Islands. They are a bold and striking group, all volcanic, Stromboli the best known because of its active forces. It is a conical bifurcated rock, nearly round, twelve miles in circumference, and rising 2500 feet out of the sea. Desolate as it seems, it has a town of 1300 people and a sparse cultivation on its rugged flanks. It is very difficult of ascent; but the view from the summit indemnifies the climber for his pains. The effect of its eruption is exceedingly grand. At a little distance the sea appears to belch forth volumes of flame, and the burning lava looks like waves of crested fire. The Sicilian peasants regard it as one of the mouths of the bottomless pit, and even Pope Gregory I. was of their opinion. It is the fashion in Messina to send hated persons there, and "Go to Stromboli!" has the full significance of our invitation to follow the example of Æneas.

Soon after sailing past Stromboli you enter the Faro, as the Straits of Messina are called. In the narrowest part is the abrupt rock of (Sciglio) Scylla (a spur of the mountains of Calabria), some two hundred feet high, its base hollowed out by the action of the waves. Opposite it is the celebrated rock and shoals of Charybdis, the two currents of the straits and the harbor of Messina creating the whirlpool. Every body knows the time-honored adage, and the symbolical fable of the ancients that Scylla was a fearful monster, who devoured sailors approaching too near. The old poets great-

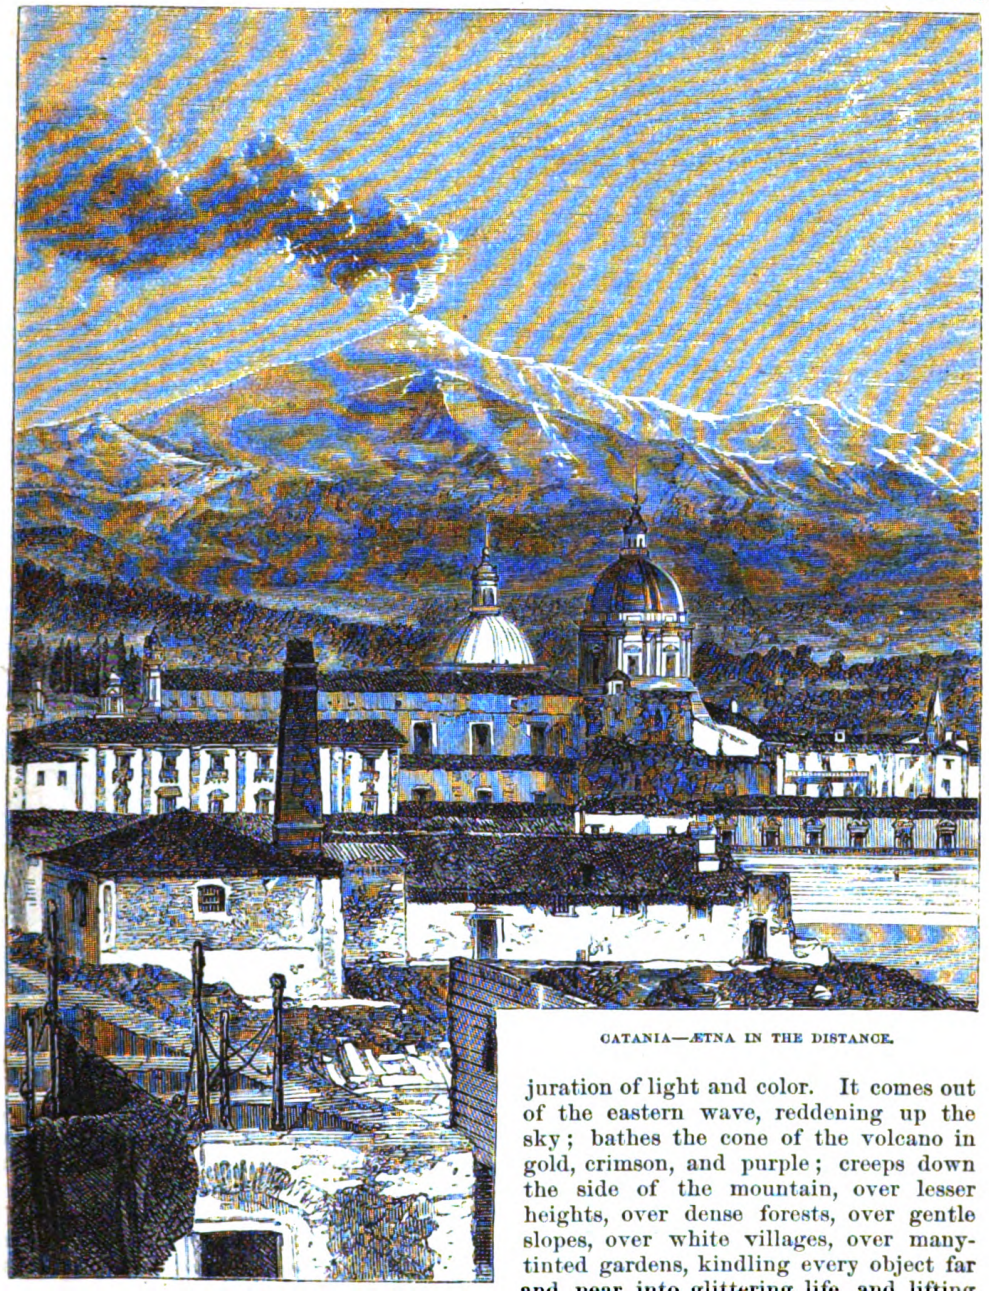
ly exaggerated (poetry, indeed, is little more than a refined art of symmetrical exaggeration) the perils of the Faro (they now have a very different application), for the Athenians and Syracusans, the Locrians and Rhegians, frequently had naval engagements there. Its waters are seventy to ninety fathoms deep, and the channel is nearly three miles wide. The curling eddies are powerful, but not at all dangerous to modern navigation.

The approach to Messina shows the town to advantage. The harbor is formed by a semicircular strip of land, which gave it its original name—Zancle (Ζαγκλη)—signifying sickle, and is one of the very best in the Mediterranean. The broad quay, la Marina, embellished by a handsome fountain and statue of Neptune, is crowded with shipping from all parts of Europe and America. The admirable commercial situation of the city has caused it to flourish in spite of its visitation by countless calamities. Earthquakes are its specialty, and as a rule they are strictly first class. They are always expected, and the inhabitants are never disappointed except as to date. The catastrophe may be delayed, but its coming can be depended on. In anticipation of earthquakes, the houses are not built of more than two stories, and many of them are but one. So familiar have earthquakes become to the Messinese that when one of them is absent, and pining for return, a sound shaking restores his spirits—it makes him feel at home.

How Messina has devised to keep one hundred thousand inhabitants, with all her magnificent opportunities of burying them, is hard to understand. But she has existed so long—she dates her founding to 1000 years B.C.—and her people are so prolific, that human nature has replaced what external nature has removed.

A precious relic shown at one of the churches is an autograph letter of the Virgin Mary addressed to the Messinese, assuring them she had taken them under her special care and protection. That there might be no question of its genuineness, she gave to the person intrusted with the sacred epistle a lock of her hair, which is also preserved, and certainly as veritable as the manuscript. Nobody but a heathen would doubt either, albeit any one might fail to understand exactly the Virgin's idea of protection. Is it represented by hurricanes, tempests, plagues, sieges, and earthquakes? These are the benignities she has showered upon her beloved city. Are they blessings in disguise? If so, the Messinese might well pray for curses without concealment.

The principal streets of the town are for the most part regular and well built, and its squares and gardens contain some handsome statues and fountains, that of Don John of Austria in the Piazza Annunziata being the most notable. The architecture is not out of the common, and, like every thing else, bears copious vestiges of earthquake, tornado, inundation, and bombardment.



The fittest hour to see the life of the city is at sunset. Then the Marina is thronged with gay equipages (the Sicilians who can afford it rejoice in riding); promenaders set out for their evening stroll on the fine road skirting the northern shore of the Faro; the sea-breeze rises; the Calabrian mountains on the opposite coast gladly thrust their snowy heads into the crimson warmth of the sunset, and when it has gone turn gray with sorrow, until the rising moon comforts them with her radiant love, and crowns their aged brows with a sheen of silver, walks in brightness on the blue waters, and stirs the slumbering earth to a soft sympathy with heaven.

The environs of Messina are lovely and luxuriant, and can be best commanded by ascending the neighboring mountain, from which the Sickle is plainly seen, the entire length of the straits, the numberless conical hills and deep ravines of the neighborhood, the grand background of the Apennines, and the wildly abrupt and changeful outline of the Lipari Islands from Stromboli to Alicudi.

An English-speaking person should not forget, though very apt to, that Messina is the scene of *Much Ado about Nothing*. The most brilliant comedy ever produced, it has not a bit of local coloring, or adaptation of time and place. Shakspeare's choice of location was mere accident. He thought of it as a name only; he took it as the mental territory to put his delightful creations on. He had never seen Sicily. His mind was with his body in England. Dogberry bids his varlets call at all the ale-houses, and names for his constables Hugh Oatcake and George Seacoal. There was never an ale-house in all Sicily, and Oatcake and Seacoal scarcely smack of the language of the country. Shakspeare was the one transcendent genius who could defy congruity, and always seem symmetrical.

From Messina to Catania is a carriage-road, following the shore and unfolding fine scenery all the way. Mountains descend nearly to the sea, leaving a strip of fertile and highly cultivated plain, dotted with picturesque towns and villages. The shore has a broad belt of white sand—a becoming border to the blue water—broken here and there by fragments of fallen rock. The little town of Taormina furnishes what many think the finest view in the whole island. It is likewise renowned for the ruins of its ancient theatre—originally erected by the Greeks, and restored by the Romans—capable of accommodating 40,000 persons. Insignificant as the town now is (its pop-

CATANIA—ÆTNA IN THE DISTANCE.

ulation is not over 4000), it was one of the oldest and most celebrated cities in Sicily. It is perched upon a precipice, and the theatre is in a hollow of the mountain. From the latter the grand survey is usually made. You see the broad expanse of the Mediterranean, the winding shore all the way from Messina to Syracuse, the variegated plains, the undulating broken surface, rising into mountains, dipping into hills, abrupt rocks, beetling cliffs, the richest verdure, the ruggedest barrenness, and Ætna looming grand and grim over the varied vastness, awing it to submission and repose. The rising of the sun works a conjuration of light and color. It comes out of the eastern wave, reddening up the sky; bathes the cone of the volcano in gold, crimson, and purple; creeps down the side of the mountain, over lesser heights, over dense forests, over gentle slopes, over white villages, over many-tinted gardens, kindling every object far and near into glittering life, and lifting the wondrous landscape to the loftiest splendors of a Southern clime.

Near Aci Reale, a considerable town, composed almost entirely of lava, is the Staircase of Acis (Scala d' Aci), where, as told in the fable, the shepherd was slain by his rival, Polyphemus, for love of Galatea, the steps consisting of nine different layers of lava, separated by a mould of vegetable earth.

In the immediate vicinity is a singular cluster of islands, known as the Crags of the Cyclops (Scogli dei Ciclopi), vast masses of lava and basaltic columns rising in savage grandeur out of the sea. These are

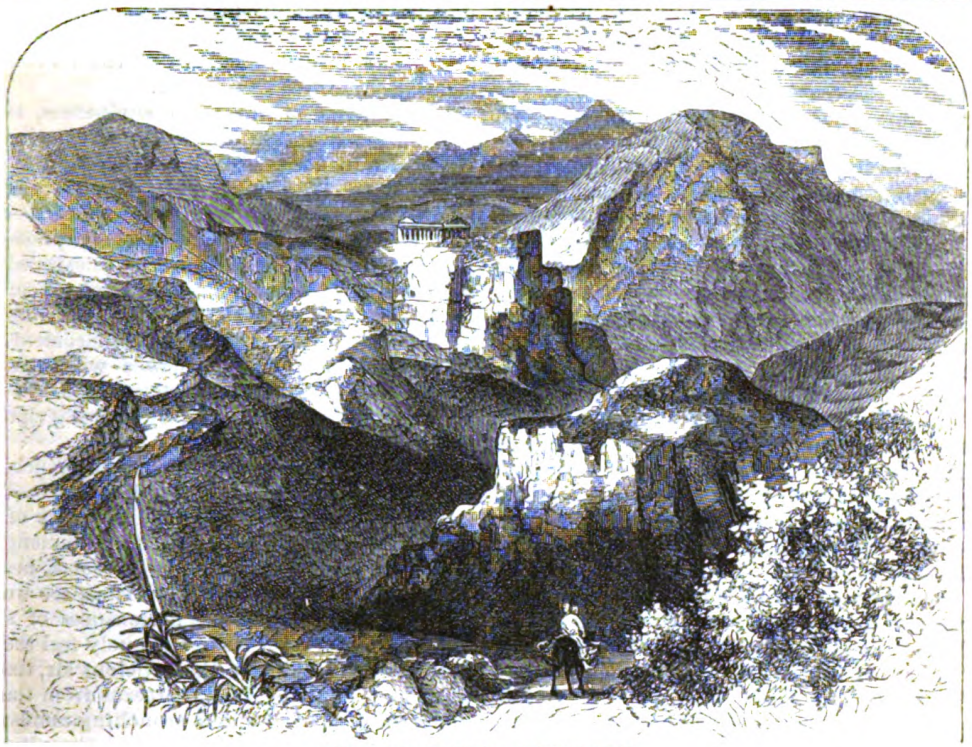
GIRGENTI.



the rocks which Polyphemus is supposed to have hurled at Ulysses as he escaped after boring out the single eye of the monster. The whole Sicilian coast is pregnant with ancient facts, figments, and traditions that seem like scattered leaves torn from classic chronicles.

In traveling on the island you have opportunities to see the pleasures of the peasantry and lower classes at the feste so common in Roman Catholic countries. Their holy-days are always holidays. They put on their best attire—often very pretty and picturesque in the interior towns—attend mass, stream out of the church, kiss their friends all round, gossip, drink wine, philander, dance; extract honey from every blossom. At night they illuminate the houses, make bonfires, discharge musketry, throw up rockets; are all children again. They are ignorant, superstitious; their province includes their world. Yet are they more contented than enlightened republicans, doomed to think for themselves, to read daily journals, to fashion their own destiny, to understand the possibility of their becoming President.

Catania, a magnet of misfortune, woos the eye of the journeyer by land or sea. At the base of Ætna, its marrer and its maker, its domes and towers look down upon luxuriant vegetation, and smile serenely in the face of calamities yet to come. Submerged again and again by floods of molten lava, it has literally risen from the hand of its destroyer to fairer life and fresher beauty. It owes its prosperity to its ruin, its fertility to its despoiler. Catania is a city of lava. Its streets are paved with lava, its mole, churches, and houses are made of lava. The moment you reach it you are besought to buy lava. You walk on lava, you sleep in lava, you breathe lava, lava becomes the substance of your being. The streets of the town (population about 66,000) are broad and open, and its piazza handsome; but neglect, uncleanness, and decay check admiration and chill enthusiasm.

The main object of going to Catania is to see Ætna, and an excellent distant view of

TEMPLE OF SEGESTE—DISTANT VIEW.

the volcano can be had from the port. The eruption of 1669, after covering the old city, poured its burning torrent into the hissing sea, and sombre and ragged masses still mark the spot. The whole of the region included in a circle of a hundred miles from the crater as a centre is within range of its destruction. Though the summit of the cone is 10,874 feet high, the gradual and graceful slope of the mountain to the plain makes its height seem much less. The vast tract is covered with vestiges of different eruptions —more than eighty in all—the old lava beds being decomposed and overspread with vegetation. The most remarkable modern eruptions are those of 1792, 1811, 1819, 1832, and 1868. The first continued for an entire year, the currents of lava while fluid being often thirty feet deep. In 1832 the sides of the mountain opened in many places, belching forth fire, ashes, and stones, while the main lava stream was eighteen miles long, one mile wide, and forty feet deep.

Ætna has three zones, the first a cultivated region (Piedimontana), from the sea to the base of the mountain. The second is a wood (Il Bosco), extending six to eight miles up the sides, of chestnut, ilex, oak, and pine. Some of the trees have extraordinary growth, the best example of which is the Chestnut-Tree of a Hundred Horses (Castagno di Centi Cavalli), so called because the Queen of Aragon is said to have taken shelter in its trunk with a retinue of a hundred cavaliers. The tree really has five distinct trunks, forming a circle through which a carriage might be driven.

Below the Bosco are nearly two hundred miniature cones, thrown up by different eruptions, that any where else would rank as creditable volcanoes. From the wood to the crater is a scene of desolation, composed of dreary wastes and deep hollows, covered with scoriæ and ashes, and buried in snow three or four months out of the twelve. This snow is a necessity to the island as well as to Malta, even to Barbary sometimes, and is gathered with the greatest care.

The ascent is tedious, though not very hard, the chief difficulties to contend against being the changes of temperature and the high wind. The crater is much less striking than that of Vesuvius. The circumference is estimated at two and a half to four miles, and the depth at six to eight hundred feet. The entire top of the mountain is heated, and jets of steam shoot up from countless sulphur-crested crevices. Near the centre of the crater are two mounds of ashes and scoriæ, and from apertures at the top and sides issue clouds of thick smoke, accompanied by hissing and rumbling sounds. A thin vapor rises from the bottom of the yawning cavern, whose interior is colored with efflorescences of ammonia, sulphur, and vitriolic salts. The bubbling and boiling, the muttering and grumbling, the rending and roaring, that seem to be perpetually going on in the bowels of the earth as you stand and listen on the brink of the burning

gulf, make you marvel more than ever at the terrible and invisible forces of nature.

Syracuse, thirty miles southeast of Catania, on the coast, is of little interest save to the antiquarian. Stagnant, neglected, and decayed at present, it is reputed to have had two hundred thousand inhabitants once —nearly ten times its present population. Classicists may weep over its departed grandeur, but practicalists who enjoy comfort will not long tarry there. The famous fountain of Arethusa, into which she was changed by Diana that she might escape Alpheus, has been profaned to a washing tank. The remains of the Greek theatre, where the venerable Timoleon harangued the citizens; the Latomiæ, or prisons cut in the solid rock, and resembling natural caverns; the Ear of Dionysius, an excavation seventy feet deep, gradually lessening to a point, from which a narrow channel conveyed the conversation of prisoners to the tyrant's hearing—are the lions of the town.

On the western coast of Sicily is Girgenti, the ancient Agrigentum, as distinguished for luxury as the modern city is for nastiness. The ruins of the Temple of Concord and Temple of Juno are extremely interesting, and the approach to the town is very picturesque. But no ruin on the island equals that of the Temple of Segeste, standing serenely beautiful on a high precipice, encompassed by an amphitheatre of many-formed mountains, exemplifying the exquisite art of the Greeks in combining situation and effect, and bringing nature to the service of their admirable handiwork.

Sicily, after centuries of supineness, is making ready and falling in to march with the Army of Progress. The Railway and Telegraph — the universal educators, the avant-couriers of popular enlightenment— will change her front and metamorphose her spirit. Her lazzaroni and priesthood are steadily dwindling. Her strongholds of ignorance and superstition have been invaded by the contagion of Advancement. Newspapers and school-houses will soon supply the place of monasteries and convents. The People are rapidly growing ripe for higher and better things.

Nature has done much, almost too much, for the classic island. She has received beauty in excess, but the deadly beauty of the fabled basilisk. While we linger among her orange groves and aloe blossoms, her broken temples and her fairy vistas, are we not held by a dreamy consciousness of a mortal charm? Do we not vaguely feel the pestilence breathing in the delicious air, the tornado whispering in the breezes from the violet sea, the earthquake crouching amidst the luxuriance of the landscape—the pitying sigh of Nature ere she takes the dread weapons from the hand of Fate to strike her suffering children down?

A SIMPLETON.

A STORY OF THE DAY.

By CHARLES READE.

CHAPTER XVIII.

THE electrified man rushed out into the storm, but he scarcely felt it in his body; the effect on his mind overpowered hailstones. The lightning seemed to light up the Past; the mighty explosions of thunder seemed cannon strokes knocking down a wall, and letting in his whole life.

Six hours the storm raged, and before it ended he had recovered nearly his whole Past, except his voyage with Captain Dodd —that, indeed, he never recovered—and the things that happened to him in the hospital before he met Phœbe Falcon and her brother: and as soon as he had recovered his lost memory his body began to shiver at the hail and rain. He tried to find his way home, but missed it; not so much, however, but that he recovered it as soon as it began to clear, and, just as they were coming out to look for him, he appeared before them, dripping, shivering, very pale and worn, with the handkerchief still about his head.

At sight of him Dick slipped back to his sister, and said, rather roughly, "There now, you may leave off crying: he is come home; and to-morrow I take him to Cape Town."

Christopher crept in, a dismal, sinister figure.

"Oh, Sir," said Phœbe, "was this a day for a Christian to be out in? How could you go and frighten us so?"

"Forgive me, madam," said Christopher, humbly; "I was not myself."

"The best thing you can do now is to go to bed, and let us send you up something warm."

"You are very good," said Christopher, and retired with the air of one too full of great amazing thoughts to gossip.

He slept thirty hours at a stretch, and then, awaking in the dead of night, he saw the past even more clear and vivid; he lighted his candle and began to grope in the *Cape Gazette*. As to dates, he now remembered when he had sailed from England, and also from Madeira. Following up this clew, he found in the *Gazette* a notice that H.M. ship *Amphitrite* had been

spoken off the Cape, and had reported the melancholy loss of a promising physician and man of science, Dr. Staines.

The account said every exertion had been made to save him, but in vain.

Staines ground his teeth with rage at this. "Every exertion! the false-hearted curs. They left me to drown without one manly effort to save me. Curse them, and curse all the world!"

Pursuing his researches rapidly, he found a much longer account of a raft picked up by Captain Dodd, with a white man on it and a dead body, the white man having on him a considerable sum in money and jewels.

Then a new anxiety chilled him. There was not a word to identify him with Dr. Staines. The idea had never occurred to the editor of the *Cape Gazette*. Still less would it occur to any one in England. At this moment his wife must be mourning for him. "Poor—poor Rosa!"

But perhaps the fatal news might not have reached her.

That hope was dashed away as soon as found. Why, these were all *old newspapers*. That gentlemanly man who had lent them to him had said so.

Old! yet they completed the year 1867.

He now tore through them for the dates alone, and soon found they went to 1868. Yet they were old papers. He had sailed in May, 1867.

"My God!" he cried, in agony, "I HAVE LOST A YEAR."

This thought crushed him. By-and-by he began to carry this awful thought into details. "My Rosa has worn mourning for me, and put it off again. I am dead to her, and to all the world."

He wept long and bitterly.

Those tears cleared his brain still more. For all that, he was not yet himself, at least I doubt it: his insanity, driven from the intellect, fastened one lingering claw into his moral nature, and hung on by it. His soul filled with bitterness and a desire to be revenged on mankind for their injustice, and this thought possessed him more than reason.

He joined the family at breakfast, and never a word all the time. But when he got up to go he said, in a strange, dogged way, as if it went against the grain, "God bless the house that succors the afflicted." Then he went out to brood alone.

"Dick," said Phœbe, "there's a change. I'll never part with him: and look, there's Colly following him, that never could abide him."

"Part with him!" said Reginald. "Of course not. He is a gentleman, and they are not so common in Africa."

Dick, who hated Falcon, ignored this speech entirely, and said, "Well, Phœbe, you and Colly are wiser than I am. Take your own way, and don't blame me if any thing happens."

And soon Christopher paid the penalty of returning reason. He suffered all the poignant agony a great heart can endure.

So this was his reward for his great act of self-denial in leaving his beloved wife. He had lost his patient; he had lost the income from that patient; his wife was worse off than before, and had doubtless suffered the anguish of a loving heart bereaved. His mind, which now seemed more vigorous than ever after its long rest, placed her before his very eyes, pale and worn with grief, in her widow's cap.

At the picture he cried like the rain. He could give her joy by writing, but he could not prevent her from suffering a whole year of misery.

Turning this over in connection with their poverty, his evil genius whispered: "By this time she has received the six thousand pounds for your death. *She* would never think of that, but her father has: and there is her comfort assured, in spite of the caitiffs who left her husband to drown like a dog."

"I know my Rosa," he thought. "She has swooned—ah, my poor darling—she has raved—she has wept"—he wept himself at the thought—"she has mourned every indiscreet act as if it was a crime. But she *has* done all this. Her good and loving but shallow nature is now at rest from the agonies of bereavement, and naught remains but sad and tender regrets. She can better endure that than poverty—cursed poverty, which has brought her and me to this, and is the only real evil in the world but bodily pain."

Then came a struggle, that lasted a whole week, and knitted his brows and took the color from his cheek, but it ended in the triumph of love and hate over conscience and common-sense. His Rosa should not be poor; and he would cheat some of those contemptible creatures called men, who had done him nothing but injustice, and at last had sacrificed his life like a rat's.

When the struggle was over, and the fatal resolution taken, then he became calmer, less solitary, and more sociable.

Phœbe, who was secretly watching him with a woman's eye, observed this change in him, and with benevolent intentions invited him one day to ride round the farm with her. He consented readily. She showed him the fields devoted to maize and wheat, and then the sheep-folds. Tim's sheep were apparently deserted; but he was discovered swinging head downward from the branch of a camel-thorn, and seeing him, it did strike one that if he had had a tail he would have been swinging by that. Phœbe called to him: he never answered, but set off running to her, and landed himself under her nose in a wheel somersault.

"I hope you are watching them, Tim," said his mistress.

"Iss, missy, always washing 'em."

"Why, there's one straying toward the wood now."

"He not go far," said Tim, coolly. The young monkey stole off a little way, then fell flat, and uttered the cry of a jackal, with startling precision. Back went the sheep to his comrades post-haste, and Tim effected a somersault and a chuckle.

"You are a clever boy," said Phœbe. "So that is how you manage them."

"Dat one way, missy," said Tim, not caring to reveal all his resources at once.

Then Phœbe rode on, and showed Christopher the ostrich pan. It was a large basin, a form the soil often takes in these parts; and in it strutted several full-grown ostriches and their young, bred on the premises. There was a little dam of water, and plenty of food about. They were herded by a Kafir infant of about six, black, glossy, fat, and clean, being in the water six times a day.

Sometimes one of the older birds would show an inclination to stray out of the pan. Then the infant rolled after her, and tapped her ankles with a wand. She instantly came back, but without any loss of dignity, for she strutted with her nose in the air, affecting completely to ignore the inferior little animal, that was nevertheless controlling her movements. "There's a farce," said Phœbe. "But you would not believe the money they cost me, nor the money they bring me in. Grain will not sell here for a quarter its value: and we can't afford to send it to Cape Town, twenty days and back: but finery, that sells every where. I gather sixty pounds the year off those poor fowls' backs—clear profit."

She showed him the granary, and told him there wasn't such another in Africa. This farm had belonged to one of the old Dutch settlers, and that breed had been going down this many a year. "You see, Sir, Dick and I being English, and not downright in want of money, we can't bring ourselves to sell grain to the middle-men for nothing, so we store it, hoping for better times, that maybe will never come. Now I'll show you how the dam is made."

They inspected the dam all round. "This is our best friend of all," said she. "Without this the sun would turn us all to tinder —crops, flowers, beasts, and folk."

"Oh, indeed," said Staines. "Then it is a pity you have not built it more scientifically. I must have a look at this."

"Ay, do, Sir, and advise us if you see any thing wrong. But hark! it is milking-time. Come and see that." So she led the way to some sheds, and there they found several cows being milked, each by a little calf and a little Hottentot at the same time, and both fighting and jostling each other for the udder. Now and then a young cow, unused to incongruous twins, would kick impatiently at both animals, and scatter them.

"That is their way," said Phœbe: "they have got it into their silly Hottentot heads as kye won't yield their milk if the calf is taken away; and it is no use arguing with 'em; they will have their own way; but they are very trusty and honest, poor things. We soon found that out. When we came here first it was in a hired wagon, and Hottentot drivers: so when we came to settle I made ready for a bit of a wrangle. But my maid Sophy, that is nurse now, and a great despiser of heathens, she says, 'Don't you trouble; them nasty ignorant blacks never charges more than their due.' 'I forgive 'em,' says I; 'I wish all white folk was as nice.' However, I did give them a trifle over, for luck: and then they got together, and chattered something near the door, hand in hand. 'La, Sophy,' says I, 'what is up now?' Says she, 'They are blessing of us. Things is come to a pretty pass, for ignorant Muslinmen heathen to be blessing Christian folk.' 'Well,' says I, 'it won't hurt us any.' 'I don't know,' says she. 'I don't want the devil prayed over me.' So she cocked that long nose of hers, and followed it in-doors."

By this time they were near the house, and Phœbe was obliged to come to her postscript, for the sake of which, believe me, she had uttered every syllable of this varied chat. "Well, Sir," said she, affecting to proceed without any considerable change of topic, "and how do you find yourself? Have you discovered the Past?"

"I have, madam. I remember every leading incident of my life."

"And has it made you happier?" said Phœbe, softly.

"No," said Christopher, gravely. "Memory has brought me misery."

"I feared as much; for you have lost your fine color, and your eyes are hollow, and lines on your poor brow that were not there before. Are you not sorry you have discovered the Past?"

"No, Mrs. Falcon. Give me the sovereign gift of reason, with all the torture it can inflict. I thank God for returning memory, even with the misery it brings."

Phœbe was silent a long time: then she said, in a low, gentle voice, and with the indirectness of a truly feminine nature, "I have plenty of writing-paper in the house; and the post goes south to-morrow, such as 'tis."

Christopher struggled with his misery, and trembled.

He was silent a long time. Then he said, "No. It is her interest that I should be dead."

"Well, but, Sir—take a thought."

"Not a word more, I implore you. I am the most miserable man that ever breathed." As he spoke, two bitter tears forced their way.

Phœbe cast a look of pity on him, and said no more; but she shook her head. Her plain common-sense revolted.

However, it did not follow he would be in the same mind next week: so she was in excellent spirits at her protégé's recovery, and very proud of her cure, and celebrated the event with a roaring supper, including an English ham and a bottle of port-wine; and, ten to one, that was English too.

Dick Dale looked a little incredulous, but he did not spare the ham any the more for that.

After supper, in a pause of the conversation, Staines turned to Dick, and said, rather abruptly, "Suppose that dam of yours were to burst and empty its contents, would it not be a great misfortune to you?"

"Misfortune, Sir! Don't talk of it. Why, it would ruin us, beast and body."

"Well, it will burst, if it is not looked to."

"Dale's Kloof dam burst! the biggest and strongest for a hundred miles round."

"You deceive yourself. It is not scientifically built, to begin, and there is a cause at work that will infallibly burst it, if not looked to in time."

"And what is that, Sir?"

"The dam is full of crabs."

"So 'tis; but what of them?"

"I detected two of them that had perforated the dike from the wet side to the dry, and water was trickling through the channel they had made. Now, for me to catch two that had come right through, there must be a great many at work honey-combing your dike; those channels, once made, will be enlarged by the permeating water, and a mere cupful of water forced into a dike by the great pressure of a heavy column has an expansive power quite out of proportion to the quantity forced in. Colossal dikes have been burst in this way with disastrous effects. Indeed, it is only a question of time, and I would not guarantee your dike twelve hours. It is full, too, with the heavy rains."

"Here's a go," said Dick, turning pale. "Well, if it is to burst, it must."

"Why so? You can make it safe in a few hours. You have got a clumsy contrivance for letting off the excess of water: let us go and relieve the dam at once of two feet of water. That will make it safe for a day or two, and to-morrow we will puddle it afresh, and demolish those busy excavators."

He spoke with such authority and earnestness that they all got up from table: a horn was blown that soon brought the Hottentots, and they all proceeded to the dam. With infinite difficulty they opened the waste sluice, lowered the water two feet, and so drenched the arid soil that in forty-eight hours flowers unknown sprang up.

Next morning, under the doctor's orders, all the black men and boys were diving with lumps of stiff clay and puddling the endangered wall with a thick coat of it. This took all the people the whole day.

Next day the clay wall was carried two feet higher, and then the doctor made them work on the other side, and buttress the dike with supports so enormous as seemed extravagant to Dick and Phœbe; but, after all, it was as well to be on the safe side, they thought: and soon they were sure of it, for the whole work was hardly finished when news came in that the dike of a neighboring Boer, ten miles off, had exploded like a cannon, and emptied itself in five minutes, drowning the farm-yard and floating the furniture, but leaving them all to perish of drought; and, indeed, the Boer's cart came every day, with empty barrels, for some time, to beg water of the Dales. Ucatella pondered all this, and said her doctor child was wise.

This brief excitement over, Staines went back to his own gloomy thoughts, and they scarcely saw him, except at supper-time.

One evening he surprised them all by asking if they would add to all their kindness by lending him a horse and a spade and a few pounds, to go to the diamond fields.

Dick Dale looked at his sister. She said, "We had rather lend them you to go home with, Sir, if you must leave us; but, dear heart, I was half in hopes—Dick and I were talking it over only yesterday—that you would go partners like with us; ever since you saved the dam."

"I have too little to offer for that, Mrs. Falcon, and, besides, I am driven into a corner. I must make money quickly, or not at all: the diamonds are only three hundred miles off. For Heaven's sake let me try my luck."

They tried to dissuade him, and told him not one in fifty did any good at it.

"Ay, but *I* shall," said he. "Great bad luck is followed by great good luck, and I feel my turn is come. Not that I rely on luck. An accident directed my attention to the diamond a few years ago, and I read a number of prime works upon the subject that told me things not known to the miners. It is clear, from the Cape journals, that they are looking for diamonds in the river only. Now I am sure that is a mistake. Diamonds, like gold, have their matrix, and it is comparatively few gems that get washed into the river. I am confident that I shall find the volcanic matrix, and perhaps make my fortune in a week or two."

When the dialogue took this turn Reginald Falcon's cheek began to flush and his eyes to glitter.

Christopher continued, "You, who have befriended me so, will not turn back, I am sure, when I have such a chance before

me; and as for the small sum of money I shall require, I will repay you some day, even if—"

"La, Sir, don't talk so. If you put it that way, why, the best horse we have, and fifty pounds in good English gold, they are at your service to-morrow."

"And pick and spade to boot," said Dick, "and a double rifle; for there are lions, and Lord knows what, between this and the Vaal River."

"God bless you both!" said Christopher. "I will start to-morrow."

"And I'll go with you," said Reginald Falcon.

CHAPTER XIX.

"HEAVEN forbid!" said Phœbe. "No, my dear, no more diamonds for us. We never had but one, and it brought us trouble."

"Nonsense, Phœbe," replied Falcon; "it was not the diamond's fault. You know I have often wanted to go there, but you objected. You said you were afraid some evil would befall me. But now Solomon himself is going to the mines, let us have no more of that nonsense. We will take our rifles and our pistols."

"There—there—rifles and pistols!" cried Phœbe: "that shows."

"And we will be there in a week, stay a month, and home with our pockets full of diamonds."

"And find me dead of a broken heart."

"Broken fiddle-stick! We have been parted longer than that, and yet here we are all right."

"Ay, but the pitcher that goes too often to the well gets broke at last. No, Reginald, now I have tasted three years' happiness and peace of mind, I can not go through what I used in England. Oh, doctor, have you the heart to part man and wife that have never been a day from each other all these years?"

"Mrs. Falcon, I would not do it for all the diamonds in Brazil. No, Mr. Falcon, I need hardly say how charmed I should be to have your company: but that is a pleasure I shall certainly deny myself, after what your good wife has said. I owe her too much to cause her a single pang."

"Doctor," said the charming Reginald, "you are a gentleman, and side with the lady. Quite right. It adds to my esteem, if possible. Make your mind easy; I will go alone. I am not a farmer. I am dead sick of this monotonous life; and, since I am compelled to speak my mind, a little ashamed, as a gentleman, of living on my wife and brother, and doing nothing for myself. So I shall go to the Vaal River, and see a little life; here there's nothing but vegetation—and not much of that. Not a word more, Phœbe, if you please. I am a good, easy, affectionate husband, but I am a man, and not a child to be tied to a woman's apron-strings, however much I may love and respect her."

Dick put in his word. "Since you are so independent you can *walk* to the Vaal River. I can't spare a couple of horses."

This hit the Sybarite hard, and he cast a bitter glance of hatred at his brother-in-law, and fell into a moody silence.

But when he got Phœbe to himself he descanted on her selfishness, Dick's rudeness, and his own wounded dignity, till he made her quite anxious he should have his own way. She came to Staines with red eyes, and said, "Tell me, doctor, will there be any women up there—to take care of you?"

"Not a petticoat in the place, I believe. It is a very rough life: and how Falcon could think of leaving you and sweet little Tommy, and this life of health and peace and comfort—"

"Yet *you* do leave us, Sir."

"I am the most unfortunate man upon the earth; Falcon is one of the happiest. Would I leave wife and child to go there? Ah me! I am dead to those I love. This is my one chance of seeing my darling again for many a long year perhaps. Oh, I must not speak of *her*—it unmans me. My good, kind friend, I'll tell you what to do. When we are all at supper, let a horse be saddled and left in the yard for me. I'll bid you all good-night, and I'll put fifty miles between us before morning. Even then *he* need not be told I am gone; he will not follow me."

"You are very good, Sir," said Phœbe; "but no. Too much has been said. I can't have him humbled by my brother, nor any one. He says I am selfish. Perhaps I am; though I never was called so. I can't bear he should think me selfish. He *will* go: and so let us have no ill blood about it. Since he is to go, of course I'd much liever he should go with you than by himself. You are sure there are no women up there—to take care of—you—both? You must be purse-bearer, Sir, and look to every penny. He is too generous when he has got money to spend."

In short, Reginald had played so upon her heart that she now urged the joint expedition, only she asked a delay of a day or two to equip them, and steel herself to the separation.

Staines did not share those vague fears that overpowered the wife, whose bitter experiences were unknown to him; but he felt uncomfortable at her condition—for now she was often in tears—and he said all he could to comfort her; and he also advised her how to profit by these terrible diamonds, in her way. He pointed out to her that her farm lay right in the road to the diamonds, yet the traffic all shunned her, passing twenty miles to the westward. Said he, "You should profit by all your resources. You

have wood, a great rarity in Africa; order a portable forge; run up a building where miners can sleep, another where they can feed; the grain you have so wisely refused to sell, grind it into flour."

"Dear heart! why, there's neither wind nor water to turn a mill."

"But there are oxen. I'll show you how to make an ox-mill. Send your Cape cart into Cape Town for iron lathes, for coffee, and tea, and groceries by the hundred-weight. The moment you are ready—for success depends on the order in which we act—then prepare great boards, and plant them twenty miles south. Write or paint on them, very large, 'The nearest way to the Diamond Mines, through Dale's Kloof, where is excellent accommodation for man and beast. Tea, coffee, home-made bread, fresh butter, etc., etc.' Do this and you will soon leave off decrying diamonds. This is the sure way to coin them. I myself take the doubtful way; but I can't help it. I am a dead man, and swift good fortune will give me life. You can afford to go the slower road and the surer."

Then he drew her the model of an ox-mill, and of a miners' dormitory, the partitions six feet six apart, so that these very partitions formed the bedstead, the bed-sacking being hooked to the uprights. He drew his model for twenty bedrooms.

The portable forge and the ox-mill pleased Dick Dale most, but the partitioned bedsteads charmed Phœbe. She said, "Oh, doctor, how can one man's head hold so many things? If there's a man on earth I can trust my husband with, 'tis you. But, if things go cross up there, promise me you will come back at once and cast in your lot with us. We have got money and stock, and you have got head-piece: we might do very well together. Indeed, indeed, we might. Promise me. Oh, do, please promise me!"

"I promise you."

And on this understanding Staines and Falcon were equipped with rifles, pickaxe, shovels, water-proofs, and full saddle-bags, and started, with many shakings of the hand and many tears from Phœbe, for the diamond washings.

CHAPTER XX.

PHŒBE'S tears at parting made Staines feel uncomfortable, and he said so.

"Pooh, pooh!" said Falcon; "crying for nothing does a woman good."

Christopher stared at him.

Falcon's spirits rose as they proceeded. He was like a boy let loose from school. His fluency and charm of manner served, however, to cheer a singularly dreary journey.

The travelers soon entered on a vast and forbidding region that wearied the eye: at their feet a dull rusty carpet of dried grass and wild camomile, with pale red sand peeping through the burned and scanty herbage. On the low mounds, that looked like heaps of sifted ashes, struggled now and then into sickliness a ragged, twisted shrub. There were flowers, too, but so sparse that they sparkled vainly in the colorless waste which stretched to the horizon. The farm-houses were twenty miles apart, and nine out of ten were new ones built by the Boers since they degenerated into white savages: mere huts, with domed kitchens behind them. In the dwelling-house the whole family pigged together, with raw flesh drying on the rafters, stinking skins in a corner, parasitical vermin of all sorts blackening the floor, and particularly a small, biting, and odoriferous tortoise, compared with which the insect a London washer-woman brings into your house in her basket is a stroke with a feather, and all this without the excuse of penury; for many of these were shepherd kings, sheared four thousand fleeces a year, and owned a hundred horses and horned cattle.

These Boers are compelled, by unwritten law, to receive travelers and water their cattle; but our travelers, after one or two experiences, ceased to trouble them; for, added to the dirt, the men were sullen, the women moody, silent, brainless; the whole reception churlish. Staines detected in them an uneasy consciousness that they had descended, in more ways than one, from a civilized race; and the superior bearing of a European seemed to remind them what they had been, and might have been, and were not; so, after an attempt or two, our adventurers avoided the Boers, and tried the Kafirs. They found the savages socially superior, though their moral character does not rank high.

The Kafir cabins they entered were caves, lighted only by the door, but deliciously cool, and quite clean; the floors of puddled clay or ants' nests, and very clean. On entering these cool retreats, the flies, that had tormented them, shirked the cool grot, and buzzed off to the nearest farm, to batten on congenial foulness. On the fat, round, glossy babies not a speck of dirt, whereas the little Boers were cakes thereof. The Kafir would meet them at the door, his clean black face all smiles and welcome. The women and grown girls would fling a spotless handkerchief over their shoulders in a moment, and display their snowy teeth in unaffected joy at sight of an Englishman.

At one of these huts, one evening, they met with something St. Paul ranks above cleanliness even, viz., Christianity. A neighboring lion had just eaten a Hottentot *faute de mieux;* and these good Kafirs wanted the Europeans not to go on at night and be eaten

for dessert. But they could not speak a word of English, and pantomimic expression exists in theory alone. In vain the women held our travelers by the coat tails, and pointed to a distant wood. In vain Kafir *père* went on all fours and growled sore. But at last a savage youth ran to the kitchen—for they never cook in the house—and came back with a brand, and sketched, on the wall of the hut, a lion with a mane down to the ground, and a saucer eye, not loving. The creature's paw rested on a hat and coat and another fragment or two of a European. The rest was foreshortened, or else eaten.

The picture completed, the females looked, approved, and raised a dismal howl.

"A lion on the road," said Christopher, gravely.

Then the undaunted Falcon seized the charcoal, and drew an Englishman in a theatrical attitude, left foot well forward, firing a gun, and a lion rolling head over heels like a buck rabbit, and blood squirting out of a hole in his perforated carcass.

The savages saw, and exulted. They were so off their guard as to confound representation with fact; they danced round the white warrior, and launched him to victory.

"Aha!" said Falcon, "I took the shine out of their lion, didn't I?"

"You did: and once there was a sculptor who showed a lion his marble group, a man trampling a lion, extracting his tongue, and so on; but report says it *did not convince the lion.*"

"Why, no; a lion is not an ass. But, for your comfort, there *are* no lions in this part of the world. They are myths. There were lions in Africa. But now they are all at the Zoo. And I wish I was there too."

"In what character—of a discontented animal, with every blessing? They would not take you in; too common in England. Hallo! this is something new. What lots of bushes! We should not have much chance with a lion here."

"There *are* no lions: it is not the Zoo," said Falcon; but he spurred on faster.

The country, however, did not change its feature; bushes and little acacias prevailed, and presently dark forms began to glide across at intervals.

The travelers held their breath, and pushed on; but at last their horses flagged; so they thought it best to stop and light a fire, and stand upon their guard.

They did so, and Falcon sat with his rifle cocked, while Staines boiled coffee, and they drank it, and after two hours' halt pushed on; and at last the bushes got more scattered, and they were on the dreary plain again. Falcon drew the rein, with a sigh of relief, and they walked their horses side by side.

"Well, what is become of the lions?" said Falcon, jauntily. He turned in his saddle, and saw a large animal stealing behind them with its belly to the very earth, and eyes hot coals; he uttered an eldrich screech, fired both barrels with no more aim than a baby, and spurred away, yelling like a demon. The animal fled another way, in equal trepidation at those tongues of flame and loud reports, and Christopher's horse reared and plunged, and deposited him promptly on the sward; but he held the bridle, mounted again, and rode after his companion. A stern chase is a long chase, and for that or some other reason he could never catch him again till sunrise. Being caught, he ignored the lioness with cool hauteur. He said he had ridden on to find comfortable quarters: and craved thanks.

This was literally the only incident worth recording that the companions met with in three hundred miles.

On the sixth day out, toward afternoon, they found, by inquiring, they were near the diamond washings, and the short route was pointed out by an exceptionally civil Boer.

But Christopher's eye had lighted upon a sort of chain of knolls, or little round hills, devoid of vegetation, and he told Falcon he would like to inspect these before going farther.

"Oh," said the Boer, "they are not on my farm, thank goodness: they are on my cousin Bulteel's;" and he pointed to a large white house about four miles distant, and quite off the road. Nevertheless, Staines insisted on going to it. But first they made up to one of these knolls and examined it; it was about thirty feet high, and not a vestige of herbage on it; the surface was composed of sand and of lumps of gray limestone, very hard, diversified with lots of quartz, mica, and other old formations.

Staines got to the top of it with some difficulty, and examined the surface all over. He came down again, and said, "All these little hills mark hot volcanic action—why, they are like boiling earth-bubbles—which is the very thing, under certain conditions, to turn carbonate of lime into diamonds. Now here is plenty of limestone unnaturally hard, and, being in a diamond country, I can fancy no place more likely to be the matrix than these earth-bubbles. Let us tether the horses and use our shovels."

They did so, and found one or two common crystals, and some jasper, and a piece of chalcedony, all in little bubbles, but no diamonds. Falcon said it was wasting time.

Just then the proprietor, a gigantic, pasty colonist, came up, with his pipe, and stood calmly looking on. Staines came down, and made a sort of apology. Bulteel smiled quietly, and asked what harm they could do him, raking that rubbish. "Rake it all avay, mine vriends," said he; "ve shall thank you moch."

He then invited them languidly to his house. They went with him, and, as he vol-

unteered no more remarks, they questioned him, and learned his father had been a Hollander, and so had his vrow's. This accounted for the size and comparative cleanliness of his place. It was stuccoed with the lime of the country outside, and was four times as large as the miserable farm-houses of the degenerate Boers. For all this, the street-door opened on the principal room, and that room was kitchen and parlor, only very large and wholesome. "But Lord"—as poor dear Pepys used to blurt out—"to see how some folk understand cleanliness!" The floor was made of powdered ants' nests, and smeared with fresh cow-dung every day. Yet these people were the cleanliest Boers in the colony.

The vrow met them, with a snow-white collar and cuffs of Hamburg linen, and the brats had pasty faces round as pumpkins, but shone with soap. The vrow was also pasty-faced, but gentle, and welcomed them with a smile, languid but unequivocal.

The Hottentots took their horses, as a matter of course. Their guns were put in a corner. A clean cloth was spread, and they saw they were to sup and sleep there, though the words of invitation were never spoken.

At supper, sun-dried flesh, cabbage, and a savory dish the travelers returned to with gusto. Staines asked what it was: the vrow told him—locusts. They had stripped her garden, and filled her very rooms, and fallen in heaps under her walls; so she had pressed them, by the million, into cakes, had salted them lightly, and stored them, and they were excellent, baked.

After supper the accomplished Reginald, observing a wire guitar, tuned it with some difficulty, and so twanged it and sang ditties to it that the flabby giant's pasty face wore a look of dreamy content over his everlasting pipe; and in the morning, after a silent breakfast, he said, "Mine vriends, stay here a year or two, and rake in mine rubbish. Ven you are tired, here are springbok and antelopes, and you can shoot mit your rifles, and ve vill cook them, and you shall sing us zongs of Vaderland."

They thanked him heartily, and said they would stay a few days, at all events.

The placid Boer went a-farming, and the pair shouldered their pick and shovel, and worked on their heap all day, and found a number of pretty stones, but no diamond.

"Come," said Falcon, "we must go to the river;" and Staines acquiesced. "I bow to experience," said he.

At the threshold they found two of the little Bulteels playing with pieces of quartz, crystal, etc., on the door-stone. One of these stones caught Staines's eye directly. It sparkled in a different way from the others: he examined it: it was the size of a white haricot bean, and one side of it polished by friction. He looked at it, and looked, and saw that it refracted the light. He felt convinced it was a diamond.

"Give the boy a penny for it," said the ingenious Falcon, on receiving the information.

"Oh!" said Staines. "Take advantage of a child?"

He borrowed it of the boy, and laid it on the table after supper. "Sir," said he, "this is what we were raking in your kopjes for, and could not find it. It belongs to little Hans. Will you sell it us? We are not experts, but we think it may be a diamond. We will risk ten pounds on it."

"Ten pounds!" said the farmer. "Nay, we rob not travelers, mine vriend."

"But if it is a diamond it is worth a hundred. See how it gains fire in the dusk."

In short, they forced the ten pounds on him, and next day went to work on another kopje.

But the simple farmer's conscience smote him. It was a slack time; so he sent four Hottentots, with shovels, to help these friendly maniacs. These worked away gayly, and the white men set up a sorting table, and sorted the stuff, and hammered the nodules, and at last found a little stone as big as a pea that refracted the light. Staines showed this to the Hottentots, and their quick eyes discovered two more that day, only smaller.

Next day nothing but a splinter or two.

Then Staines determined to dig deeper, contrary to the general impression. He gave his reason: "Diamonds don't fall from the sky. They work up from the ground; and clearly the heat must be greater farther down."

Acting on this, they tried the next strata, but found it entirely barren. After that, however, they came to a fresh layer of carbonate, and here, Falcon hammering a large lump of conglomerate, out leaped all of a sudden a diamond big as a nut, that ran along the earth gleaming like a star. It had polished angles and natural facets, and even a novice with an eye in his head could see it was a diamond of the purest water. Staines and Falcon shouted with delight, and made the blacks a present on the spot.

They showed the prize at night, and begged the farmer to take to digging. There was ten times more money beneath his soil than on it.

Not he. He was a farmer: did not believe in diamonds.

Two days afterward another great find. Seven small diamonds.

Next day a stone as large as a cob-nut, and with strange and beautiful streaks. They carried it home to dinner, and set it on the table, and told the family it was worth a thousand pounds. Bulteel scarcely looked at it; but the vrow trembled, and all the young folk glowered at it.

In the middle of dinner it exploded like a cracker, and went literally into diamond-dust.

"Dere goes von tousand pounds," said Bulteel, without moving a muscle.

Falcon swore. But Staines showed fortitude. "It was laminated," said he, "and exposure to the air was fatal."

Owing to the invaluable assistance of the Hottentots, they had in less than a month collected four large stones of pure water, and a wine-glassful of small stones, when, one fine day, going to work calmly after breakfast, they found some tents pitched, and at least a score of dirty diggers, bearded like the pard, at work on the ground. Staines sent Falcon back to tell Bulteel, and suggest that he should at once order them off, or, better still, make terms with them. The phlegmatic Boer did neither.

In twenty-four hours it was too late. The place was rushed. In other words, diggers swarmed to the spot, with no idea of law but diggers' law.

A thousand tents rose like mushrooms; and poor Bulteel stood smoking, and staring amazed, at his own door, and saw a veritable procession of wagons, Cape carts, and powdered travelers file past him to take possession of his hillocks. Him, the proprietor, they simply ignored; they had a committee, who were to deal with all obstructions, landlords and tenants included. They themselves measured out Bulteel's farm into thirty-foot claims, and went to work with shovel and pick. They held Staines's claim sacred —that was diggers' law; but they confined it strictly to thirty feet square.

Had the friends resisted, their brains would have been knocked out. However, they gained this, that dealers poured in, and, the market being not yet glutted, the price was good; Staines sold a few of the small stones for two hundred pounds. He showed one of the larger stones. The dealer's eye glittered, but he offered only three hundred pounds, and this was so wide of the ascending scale on which a stone of that importance is priced that Staines reserved it for sale at Cape Town.

Nevertheless he afterward doubted whether he had not better have taken it; for the multitude of diggers turned out such a prodigious number of diamonds at Bulteel's pan that a sort of panic fell on the market.

These dry diggings were a revelation to the world. Men began to think the diamond, perhaps, was a commoner stone than any one had dreamed it to be.

As to the discovery of stones, Staines and Falcon lost nothing by being confined to a thirty-foot claim. Compelled to dig deeper, they got into richer strata, where they found garnets by the pint, and some small diamonds, and at last, one lucky day, their largest diamond. It weighed thirty-seven carats, and was a rich yellow. Now when a diamond is clouded or off color, it is terribly depreciated; but a diamond with a positive color is called a fancy stone, and ranks with the purest stones.

"I wish I had this in Cape Town," said Staines.

"Why, I'll take it to Cape Town, if you like," said the changeable Falcon.

"You will?" said Christopher, surprised.

"Why not? I'm not much of a digger. I can serve our interest better by selling. I could get a thousand pounds for this at Cape Town."

"We will talk of that quietly," said Christopher.

Now the fact is, Falcon, as a digger, was not worth a pin. He could not sort. His eyes would not bear the blinding glare of a tropical sun upon lime and dazzling bits of mica, quartz, crystal, white topaz, etc., in the midst of which the true glint of the royal stone had to be caught in a moment. He could not sort, and he had not the heart to dig. The only way to make him earn his half was to turn him into the traveling and selling partner.

Christopher was too generous to tell him this; but he acted on it, and said he thought his was an excellent proposal: indeed, he had better take all the diamonds they had got to Dale's Kloof first, and show them to his wife for her consolation. "And perhaps," said he, "in a matter of this importance, she will go to Cape Town with you, and try the market there."

"All right," said Falcon.

He sat and brooded over the matter a long time, and said, "Why make two bites of a cherry? They will only give us half the value at Cape Town: why not go by the steamer to England, before the London market is glutted, and all the world finds out that diamonds are as common as dirt?"

"Go to England! What, without your wife? I'll never be a party to that. Me part man and wife! If you knew my own story—"

"Why, who wants you?" said Reginald. "You don't understand. Phœbe is dying to visit England again; but she has got no excuse. If you like to give her one, she will be much obliged to you, I can tell you."

"Oh, that is a very different matter. If Mrs. Falcon can leave her farm—"

"Oh, that brute of a brother of hers is a very honest fellow, for that matter. She can trust the farm to him. Besides, it is only a month's voyage by the mail steamer."

This suggestion of Falcon's set Christopher's heart bounding and his eyes glistening. But he restrained himself, and said, "This takes me by surprise; let me smoke a pipe over it."

He not only did that, but he lay awake all night.

The fact is, that for some time past Christopher had felt sharp twinges of conscience, and deep misgivings as to the course he had pursued in leaving his wife a single day in the dark. Complete convalescence had cleared his moral sentiments, and, perhaps, after all, the discovery of the diamonds had co-operated; since now the insurance money was no longer necessary to keep his wife from starving.

"Ah!" said he, "faith is a great quality; and how I have lacked it!"

To do him justice, he knew his wife's excitable nature, and was not without fears of some disaster should the news be communicated to her unskillfully.

But this proposal of Falcon's made the way clearer. Mrs. Falcon, though not a lady, had all a lady's delicacy, and all a woman's tact and tenderness. He knew no one in the world more fit to be trusted with the delicate task of breaking to his Rosa that the grave, for once, was baffled, and her husband lived. He now became quite anxious for Falcon's departure, and ardently hoped that worthy had not deceived himself as to Mrs. Falcon's desire to visit England.

In short, it was settled that Falcon should start for Dale's Kloof, taking with him the diamonds, believed to be worth altogether three thousand pounds at Cape Town, and nearly as much again in England, and a long letter to Mrs. Falcon, in which Staines revealed his true story, told her where to find his wife, or hear of her, viz., at Kent Villa, Gravesend, and sketched an outline of instructions as to the way, and cunning degrees, by which the joyful news should be broken to her. With this he sent a long letter to be given to Rosa herself, but not till she should know all; and in this letter he inclosed the ruby ring she had given him. That ring had never left his finger, by sea or land, in sickness or health.

The letter to Rosa was sealed. The two letters made quite a packet; for in the letter to his beloved Rosa he told her every thing that had befallen him. It was a romance, and a picture of love—a letter to lift a loving woman to heaven, and almost reconcile her to all her bereaved heart had suffered.

This letter, written with many tears from the heart that had so suffered, and was now softened by good fortune and bounding with joy, Staines intrusted to Falcon, together with the other diamonds, and, with many warm shakings of the hand, started him on his way.

"But mind, Falcon," said Christopher, "I shall expect an answer from Mrs. Falcon in twenty days at farthest. I do not feel so sure as you do that she wants to go to England, and, if not, I must write to Uncle Philip. Give me your solemn promise, old fellow, an answer in twenty days—if you have to send a Kafir on horseback."

"I give you my honor," said Falcon, superbly.

"Send it to me at Bulteel's Farm."

"All right. 'Dr. Christie, Bulteel's Farm.'"

"Well—no. Why should I conceal my real name any longer from such friends as you and your wife? Christie is short for Christopher—that *is* my Christian name; but my surname is Staines. Write to 'Dr. Staines.'"

"Doctor Staines!"

"Yes. Did you ever hear of me?"

Falcon wore a strange look. "I almost think I have. Down at Gravesend, or somewhere."

"That is curious. Yes, I married my Rosa there—poor thing! God bless her; God comfort her. She thinks me dead."

His voice trembled, he grasped Falcon's cold hand till the latter winced again, and so they parted, and Falcon rode off muttering, "Doctor Staines! so then *you* are Doctor Staines."

CHAPTER XXI.

ROSA STAINES had youth on her side, and it is an old saying that youth will not be denied. Youth struggled with death for her, and won the battle.

But she came out of that terrible fight weak as a child. The sweet pale face—the widow's cap, the suit of deep black—it was long ere these came down from the sick-room. And, when they did, oh, the dead blank! The weary, listless life! The days spent in sighs and tears and desolation. Solitude! solitude! Her husband was gone, and a strange woman played the mother to her child before her eyes.

Uncle Philip was devotedly kind to her, and so was her father, but they could do nothing for her.

Months rolled on, and skinned the wound over. Months could not heal. Her boy became dearer and dearer, and it was from him came the first real drops of comfort, however feeble.

She used to read her lost one's diary every day, and worship in deep sorrow the mind she had scarcely respected until it was too late. She searched in this diary to find his will, and often she mourned that he had written on it so few things she could obey. Her desire to obey the dead, whom, living, she had often disobeyed, was really simple and touching. She would mourn to her father that there were so few commands to her in his diary. "But," said she, "memory brings me back his will in many things, and to obey is now the only sad comfort I have."

It was in this spirit she now forced herself to keep accounts. No fear of her wearing stays now; no powder; no trimmings; no waste.

After the usual delay her father told her

she should instruct a solicitor to apply to the insurance company for the six thousand pounds. She refused with a burst of agony. "The price of his life," she screamed. "Never! I'd live on bread and water sooner than touch that vile money."

Her father remonstrated gently. But she was immovable. "No. It would be like consenting to his death."

Then Uncle Philip was sent for.

He set her child on her knee, and gave her a pen. "Come," said he, sternly, "be a woman, and do your duty to little Christie."

She kissed the boy, cried, and did her duty meekly. But when the money was brought her she flew to Uncle Philip and said, "There! there!" and threw it all before him, and cried as if her heart would break. He waited patiently, and asked her what he was to do with all that: invest it?

"Yes, yes, for my little Christie."

"And pay you the interest quarterly?"

"Oh, no, no. Dribble us out a little as we want it. That is the way to be truly kind to a simpleton. I hate that word."

"And suppose I run off with it? Such confiding geese as you corrupt a man."

"I shall never corrupt you. Crusty people are the soul of honor."

"Crusty people!" cried Philip, affecting amazement. "What are they?"

She bit her lip and colored a little, but answered, adroitly, "They are people that pretend not to have good hearts, but have the best in the world, far better ones than your smooth one: that's crusty people."

"Very well," said Philip; "and I'll tell you what simpletons are. They are little transparent-looking creatures that look shallow, but are as deep as old Nick, and make you love them in spite of your judgment. They are the most artful of their sex; for they always achieve its great object, to be loved—the very thing that clever women sometimes fail in."

"Well, and if we are not to be loved, why live at all—such useless things as I am?" said Rosa, simply.

So Philip took charge of her money, and agreed to help her save money for her little Christopher. Poverty should never destroy him, as it had his father.

As months rolled on, she crept out into public a little; but always on foot, and a very little way from home.

Youth and sober life gradually restored her strength, but not her color nor her buoyancy.

Yet she was, perhaps, more beautiful than ever; for a holy sorrow chastened and sublimed her features: it was now a sweet, angelic, pensive beauty, that interested every feeling person at a glance.

She would visit no one; but, a twelvemonth after her bereavement, she received a few chosen visitors.

One day a young gentleman called, and sent up his card, "Lord Tadcaster," with a note from Lady Cicely Treherne, full of kindly feeling. Uncle Philip had reconciled her to Lady Cicely, but they had never met.

Mrs. Staines was much agitated at the very name of Lord Tadcaster; but she would not have missed seeing him for the world.

She received him, with her beautiful eyes wide open, to drink in every lineament of one who had seen the last of her Christopher.

Tadcaster was wonderfully improved: he had grown six inches out at sea, and, though still short, was not diminutive; he was a small Apollo, a model of symmetry, and had an engaging, girlish beauty, redeemed from downright effeminacy by a golden mustache like silk, and a tanned cheek that became him wonderfully.

He seemed dazzled at first by Mrs. Staines, but murmured that Lady Cicely had told him to come, or he would not have ventured.

"Who can be so welcome to me as you?" said she; and the tears came thick in her eyes directly.

Soon, he hardly knew how, he found himself talking of Staines, and telling her what a favorite he was, and all the clever things he had done.

The tears streamed down her cheeks, but she begged him to go on telling her, and omit nothing.

He complied heartily, and was even so moved by the telling of his friend's virtues, and her tears and sobs, that he mingled his tears with hers. She rewarded him by giving him her hand as she turned away her tearful face to indulge the fresh burst of grief his sympathy evoked.

When he was leaving, she said, in her simple way, "Bless you."—"Come again," she said: "you have done a poor widow good."

Lord Tadcaster was so interested and charmed, he would gladly have come back next day to see her; but he restrained that extravagance, and waited a week.

Then he visited her again. He had observed the villa was not rich in flowers, and he took her down a magnificent bouquet, cut from his father's hot-houses. At sight of him, or at sight of it, or both, the color rose for once in her pale cheek, and her pensive face wore a sweet expression of satisfaction. She took his flowers, and thanked him for them, and for coming to see her.

Soon they got on the only topic she cared for, and in the course of this second conversation he took her into his confidence, and told her he owed every thing to Dr. Staines. "I was on the wrong road altogether, and he put me right. To tell you the truth, I used to disobey him now and then while he was alive, and I was always the worse for it; now he is gone I never disobey him. I

have written down a lot of wise, kind things he said to me, and I never go against any one of them. I call it my book of oracles. Dear me, I might have brought it with me."

"Oh yes; why didn't you?" rather reproachfully.

"I will bring it next time."

"Pray do."

Then she looked at him with her lovely swimming eyes, and said, tenderly, "And so here is another that disobeyed him living, but obeys him dead. What will you think when I tell you that I, his wife, who now worship him when it is too late, often thwarted and vexed him when he was alive?"

"No, no. He told me you were an angel, and I believe it."

"An angel! a good-for-nothing, foolish woman—who sees every thing too late."

"Nobody else should say so before me," said the little gentleman, grandly. "I shall take *his* word before yours on this one subject. If ever there was an angel you are one, and oh! what would I give if I could but say or do any thing in the world to comfort you!"

"You can do nothing for *me*, dear, but come and see me often, and talk to me as you do—on the one sad theme my broken heart has room for."

This invitation delighted Lord Tadcaster, and the sweet word "dear" from her lovely lips entered his heart, and ran through all his veins like some rapturous but dangerous elixir. He did not say to himself, "She is a widow with a child, feels old with grief, and looks on me as a boy who has been kind to her." Such prudence and wariness were hardly to be expected from his age. He had admired her at first sight, very nearly loved her at their first interview, and now this sweet word opened a heavenly vista. The generous heart that beat in his small frame burned to console her with a life-long devotion and all the sweet offices of love.

He ordered his yacht to Gravesend—for he had become a sailor—and then he called on Mrs. Staines, and told her, with a sort of sheepish cunning, that now as his yacht *happened* to be at Gravesend, he could come and see her very often. He watched her timidly to see how she would take that proposition.

She said, with the utmost simplicity, "I'm very glad of it."

Then he produced his oracles; and she devoured them. Such precepts to Tadcaster as she could apply to her own case she instantly noted in her memory, and they became her law from that moment.

Then in her simplicity she said, "And I will show you some things in his own handwriting that may be good for you: but I can't show you the whole book; some of it is sacred from every eye but his wife's. His wife's? Ah me! his widow's."

Then she pointed out passages in the diary that she thought might be for his good; and he nestled to her side, and followed her white finger with loving eyes, and was in an Elysium—which she would certainly have put a stop to at that time had she divined it. But all wisdom does not come at once to an unguarded woman. Rosa Staines was wiser about her husband than she had been, but she had plenty to learn.

Lord Tadcaster anchored off Gravesend, and visited Mrs. Staines nearly every day. She received him with a pleasure that was not at all lively, but quite undisguised. He could not doubt his welcome; for once, when he came, she said to the servant, "Not at home," a plain proof she did not wish his visit to be cut short by any one else.

And so these visits and devoted attentions of every kind went on unobserved by Lord Tadcaster's friends, because Rosa would never go out, even with him; but, at last, Mr. Lusignan saw plainly how this would end, unless he interfered.

Well, he did not interfere; on the contrary, he was careful to avoid putting his daughter on her guard. He said to himself, "Lord Tadcaster does her good. I'm afraid she would not marry him, if he was to ask her now; but in time she might. She likes him a great deal better than any one else."

As for Philip, he was abroad for his own health, somewhat impaired by his long and faithful attendance on Rosa.

So now Lord Tadcaster was in constant attendance on Rosa. She was languid, but gentle and kind; and, as mourners, like invalids, are apt to be egotistical, she saw nothing but that he was a comfort to her in her affliction.

While matters were so, the Earl of Miltshire, who had long been sinking, died, and Tadcaster succeeded to his honors and estates.

Rosa heard of it, and, thinking it was a great bereavement, wrote him one of those exquisite letters of condolence a lady alone can write. He took it to Lady Cicely, and showed it to her. She highly approved it.

He said, "The only thing—it makes me ashamed I do not feel my poor father's death more; but, you know, it has been so long expected." Then he was silent a long time; and then he asked her if such a woman as that would not make him happy, if he could win her.

It was on her ladyship's tongue to say, "She did not make her first happy;" but she forbore, and said, coldly, that was maw than she could say.

Tadcaster seemed disappointed by that, and by-and-by Cicely took herself to task. She asked herself what were Tadcaster's chances in the lottery of wives. The heavy

army of scheming mothers, and the light cavalry of artful daughters, rose before her cousinly and disinterested eyes, and she asked herself what chance poor little Tadcaster would have of catching a true love, with a hundred female artists manœuvring, wheeling, ambuscading, and charging upon his wealth and titles. She returned to the subject of her own accord, and told him she saw but one objection to such a match: the lady had a son by a man of rare merit and misfortune. Could he, at his age, undertake to be a father to that son? "Othahwise," said Lady Cicely, "maak my words, you will quall over that poor child; and you will have two to quall with, because I shall be on her side."

Tadcaster declared to her that the child should be quite the opposite of a bone of contention. "I have thought of that," said he, "and I mean to be so kind to that boy, I shall *make* her love me for that."

On these terms Lady Cicely gave her consent.

Then he asked her should he write, or ask her in person.

Lady Cicely reflected. "If you write, I think she will say no."

"But if I go?"

"Then it will depend on how you do it. Rosa Staines is a true mourner. Whatever you may think, I don't believe the idea of a second union has ever entered her head. But then she is very unselfish: and she likes you better than any one else, I dare say. I don't think your title or your money will weigh with her now. But, if you show her your happiness depends on it, she may perhaps cry and sob at the very idea of it, and then, after all, say, 'Well, why not—if I can make the poor soul happy?'"

So, on this advice, Tadcaster went down to Gravesend, and Lady Cicely felt a certain self-satisfaction; for her well-meant interference having lost Rosa one husband, she was pleased to think she had done something to give her another.

Lord Tadcaster came to Rosa Staines; he found her seated with her head upon her white hand, thinking sadly of the past.

At sight of him in deep mourning she started, and said, "Oh!"

Then she said, tenderly, "We are of one color now," and gave him her hand.

He sat down beside her, not knowing how to begin.

"I am not Tadcaster now. I am Earl of Miltshire."

"Ah, yes; I forgot," said she, indifferently.

"This is my first visit to any one in that character."

"Thank you."

"It is an awfully important visit to me. I could not feel myself independent, and able to secure your comfort and little Christie's, without coming to the lady, the only lady I ever saw, that—oh, Mrs. Staines—Rosa—who could see you as I have done—mingle his tears with yours as I have done, and not love you, and long to offer you his love?"

"Love! to me, a broken-hearted woman, with nothing to live for but his memory and his child!"

She looked at him with a sort of scared amazement.

"His child shall be mine. His memory is almost as dear to me as to you."

"Nonsense, child, nonsense!" said she, almost sternly.

"Was he not my best friend? Should I have the health I enjoy, or even be alive, but for him? Oh, Mrs. Staines—Rosa, you will not live all your life unmarried; and who will love you as I do? You are my first and only love; my happiness depends on you."

"Your happiness depend on me! Heaven forbid—a woman of my age, that feels so old, old, old."

"You are not old: you are young, and sad, and beautiful, and my happiness depends on you." She began to tremble a little. Then he kneeled at her knees, and implored her, and his hot tears fell upon the hand she put out to stop him, while she turned her head away, and the tears began to run.

Oh! never can the cold dissecting pen tell what rushes over the heart that has loved and lost, when another true love first kneels and implores for love, or pity, or any thing the bereaved can give.

RUSSIAN POLICY IN ASIA.

BY THOMAS W. KNOX.

IT is less than three hundred years since the Russian power crossed the Ural Mountains and penetrated Asia. Up to the middle of the sixteenth century the Volga River formed the eastern boundary of the empire, and between that stream and the Urals there lay Kasan, Viatka, and Perm, under Tartar domination, and forming part of the so-called Golden Horde, or Kiptchak Khanate. For two hundred years the khanate had menaced the safety of the Czar and his dominions, and on more than one occasion its cavalry had pushed its expeditions to the very walls of Moscow, and laid waste large areas of fertile land. Kasan was the stronghold whence the armies of the khanate issued, and the Russians regarded with a covetous eye this fair city of the East. Czar Ivan the Terrible determined to capture it, and marshaled his forces accordingly. Crushing opposition, he pressed forward, and at length laid siege to Kasan. The Tartars resisted, but the superior arms and dogged determination of the Russians prevailed. A practicable breach was made in the walls, an assault was ordered, and the citadel was stormed. The Russian loss was severe, and at one moment the assailants wavered and

fell back. A second time they came forward, and, fighting bravely, carried the works, and added Kasan to the empire. With the fall of the city the khanate submitted to the Czar, and the crown of the kingdom of Kasan was carried in triumph to Moscow, and added to the trophies in the treasury of the Muscovite government. To-day the traveler who visits the treasury in the Kremlin of Moscow may see this captured crown side by side with the crowns of Astrakhan and Poland. In the *Kazansky Sobor*, or Church of Kasan, in St. Petersburg, he may see the miraculous picture which was borne in front of the troops at the storming of the citadel, and which—as the orthodox Russian will tell you—converted defeat into victory, and gave an infidel city to the hands of those whose religion came from Bethlehem through the meek and lowly Nazarene.

Ivan IV. was justly surnamed the Terrible. He possessed the ferocity of a wild beast, and on the slightest caprice would condemn his subjects to death. In a single year sixty thousand men were killed by his orders, many of them by the most cruel tortures. One of his favorite amusements was to bend down two small and supple trees by the united strength of half a hundred men, so that the tops of the trees would be brought together at the ground. The victim would then be led forward, and his feet would be fastened, the right to one of the trees, and the left to the other. At a signal the restraining pressure would be removed, and the elasticity of the wood swung the man into the air, where he was generally torn in two. Burning at the stake, tearing the flesh with hot pincers, roasting in ovens, and the like, were among the jovial fancies of this Muscovite ruler; and to show that he had no fastidious fondness for his blood-relations, he murdered with his own hand his son Ivan, who had been a sharer in his pastimes and cruelties. A modern jury might acquit him of any intentional crime, as he professed repentance and sorrow for what he had done, and in his old age determined to enter a convent—a pious and praiseworthy resolution, which death prevented him from fulfilling. Despite his cruelties, he did more for the greatness and glory of Russia than any of his predecessors, and it was in consequence of his cruelties that his country began that career of conquest in Asia which is still progressing, and has led to one of the most important political questions of the day.

An unjust tax and conscription were made upon the Cossacks of the Don, and a portion of them determined to flee rather than submit. Under the guidance of Yermak Timofayeff, their *hetman* (chief), they crossed the Volga River and passed beyond the Ural Mountains. They wished to settle in Kasan, but the Czar pursued them relentlessly, and they had no alternative other than a refuge in Asia. It was in 1581 that Yermak led his followers—less than a thousand in number—beyond the Urals and into that wide area where flow the Obi and the Irtish. They subjugated the Tartar inhabitants wherever they met them, and on the banks of the Irtish erected a fort on the site of a Tartar village which bore the name of "Sibeer." The fort was called Siberia, and from that fort the whole of Northern Asia received the name it now bears. The Cossacks gave the captured country to their Czar, and in return they received a pardon for their old misdeeds. Ivan sent a patent of nobility and a suit of armor to Yermak. The Cossack freebooter was delighted with this mark of esteem, and the day after its reception he went on a spree. Dressed in his iron garments, and in a state of intoxication, he attempted to swim the Irtish, and his effort resulted in a funeral a few days later, at which the conqueror of Siberia was the object of deep grief and warm eulogy.

From the time of Yermak Russia has not halted in her career of Asiatic conquest. So rapidly did she push forward that her flag dominated nearly five million square miles of territory in less than seventy years from the founding of the fort on the Irtish. The banner of the Black Eagle was borne northward to the shores of the frozen ocean, along the valleys of the Obi, the Yenisei, and the Lena; it floated where the waters of the Okhotsk Sea kiss the base of the Stanovoi Mountains, and open their broad gateway to the Pacific; it waved on the banks of the Amoor, along whose parent streams the Mongol shepherds wander, and was held aloft on the plain where Gengis-Khan, the conqueror of Persia and Cathay, first saw the light, and fancied he heard heavenly voices calling him to conquest and a career of glory. Southward to the Altai Mountains it was carried, and from the summits of those lofty peaks it hung menacingly toward Central Asia, as the northern winds impelled it. The indomitable Russian will sustained it, and wherever it was planted its supporters were determined to remain. Northward there were only scattered tribes, who could offer but a feeble resistance; eastward there were the Chinese, and the rulers of the Celestial Empire early saw the impending danger. To expel the Russians from the Amoor they sent a large army, and after an obstinate struggle, in which the Chinese were twice forced to retire, they gained their point by a treaty, and compelled the Russians to depart from the places where they had established forts and planted fields of wheat and corn. For a hundred and fifty years the Russian advance in that direction was stopped, but it was renewed in 1854, when a Russian expedition seized the Amoor and

held it by main force until diplomacy, skillfully following the Chinese reverses in the war with France and England, secured by treaty what had been taken without warrant of law. The Russian eye is fixed on Mongolia; portions of it have fallen into Russian hands, and other portions will be taken with each succeeding decade, until the whole, or all that is worth taking, has been seized. Manifest destiny is apparent in the Russian maps of Eastern Siberia. On all these maps, published in the last ten years, Mongolia is delineated with more than ordinary care, and it is evident that the compiler intended to save the expense and trouble of new editions at frequent intervals. His work was performed for the future, not for the present, and judging by the rapid progress of events, the future for which he labored is not a distant one.

Russian progress in Central Asia has been even more rapid than in the eastern part of the continent. Central Asia is considered more important than Manchooria and the plains of Gobi, and the Muscovite eye is more firmly set upon it. The conquest of the Amoor was undertaken without imperial orders, or rather the preparations were made and every thing was ready before the government at St. Petersburg was aware of the state of affairs. I may be permitted to digress a little to tell the story of these preliminaries, as an illustration of the way things are done in Russia.

In 1848 General Nicholas Mouravieff was sent to Eastern Siberia with the commission of governor-general. He was a man of great energy and daring; whatever he desired he generally obtained, and was not likely to be deterred from his undertaking by any ordinary obstacles. It was then nearly a century and a half since the expulsion of the Russians from the Amoor, and as General Mouravieff looked around for something to do he concluded that the conquest of the great river would be the neat thing. He made a requisition for arms and ammunition, he mobilized the Cossacks under his command, gathered supplies at the head of navigation on the Ingoda—one of the two rivers that form the Amoor—constructed two steamers and a large number of flat-boats, and, in fact, prepared for a campaign. When nearly every thing was ready he wrote to the emperor that he could occupy the Amoor without difficulty, and probably without opposition, and that an important addition could be made to Asiatic Russia. Mouravieff understood his man: Nicholas then occupied the throne, and his spirit was charmed with the proposal of his Siberian viceroy. He called a cabinet-council; the measure met with prompt approval of the cabinet, and Mouravieff was told to go ahead. He did so, and the result was the complete occupation of the valley of the Amoor without bloodshed. When I ascended the Amoor a Russian companion, who was in Mouravieff's expedition, told me that there was something very ludicrous in the contact of the Russian with the Chinese troops. "There was a Chinese guard," said he, "at the mouth of the Ingoda. When our first boat approached the point the commander of the guard waved his hand and ordered the boat to return. No attention was paid to his command; we kept on as if nothing had happened, and he continued to shout to us till we were out of hearing. He did the same thing when the second and every other boat appeared. All he did was to shout and command us, under penalty of death, to go back; and the same thing occurred at every Chinese guard station and garrison post from that place to the sea. Not a shot was fired on either side, and we had strict orders not to provoke a collision. They continued that sort of farce for two years, and then, probably in consequence of orders from Pekin, gave it up."

It is in consequence of this halting, hesitating policy of the Chinese that the Russians have been able to encroach so much upon their territory. Let a Chinese scouting party cross the Mongolian frontier and invade the Muscovite territory, it would speedily come to grief. The nearest Cossack commander would summon them to surrender, and would precede—not follow—the summons with a volley of rifle-balls. Then he would send a report to his superior, and await orders for his future action. Let a Russian force make a similar invasion of Mongolian soil, the Chinese commander would simply order the invaders back, and if they paid no attention to his command he would report their outrageous conduct to the proper officials. Chinese red tape is broad and long, and before any action could be taken it would be necessary to hear from the *tsun-le-yamun* of the province, and no orders could be sent thence without an approval from Pekin. Meantime the Russians would do as they pleased: if they were on a scouting expedition, they would end it and be at home again before the order came for their extermination; and if they were bent on colonizing the country, they would build a fort, put in a crop of grain, lay out a town, sell corner lots, erect a church, and start a cemetery before the Chinese made up their minds what to do. The Russians understand the value of time, and the Chinese do not; hence the easy triumph of the former over the latter.

When it comes to diplomacy the Russian is at home in dealing with the Oriental. To begin with, he is about half Asiatic by nature, and long experience has made him perfect enough for all practical purposes, not to speak of many unpractical ones. Patience and perseverance are eminently nec-

essary in dealing with an Asiatic, and where a delicate matter is to be negotiated you can not be too cautious in selecting a negotiator. Set an American or an Englishman to work on a thing of this sort with a Chinese, and he would be in danger of spoiling the whole business by his bluntness. But confide it to a Russian, and you can feel pretty certain that he will come out of it with flying colors. The Russians are so accustomed to the roundabout way of doing business that they carry it into nearly every thing, and if an American wishes to deal with them successfully he must bottle up his impatience, and never under any circumstances seem to be in a hurry. When two Russian merchants are about to conduct a purchase or sale, they begin by swallowing half a dozen cups of tea, smoking a score or so of cigarettes, talking about the weather, the crops, their families, their neighbors, and in this way they edge up to the subject which is uppermost in their minds. If you want to buy a dog, you must begin by pretending that you want to sell a cat with a litter of kittens; the other party does not want any feline property, nor does he know any body who would accept it. At this stage of the conversation you may venture to hint your desires in the dog line, and after more tea, or something stronger, and more cigarettes, you can conclude the negotiations.

At Irkutsk I wanted to buy a sleigh for a journey westward, and hearing of a man who had one for sale, I went to see it. A Russian acquaintance went with me, and after an introduction to the merchant we sat down in his parlor to drink a glass of *nalifka*, a sort of home-made cordial analogous to currant wine, though somewhat stronger. We drank nalifka at least half an hour before we touched upon the topic of business, and it was introduced very gingerly by my companion, who ventured to remark the deep sorrow that had fallen upon him in consequence of my prospective departure from Irkutsk. Then we took another drink, and it was hinted that I could not leave without a vehicle of some sort. This axiomatic proposition required moistening like its predecessor, and so, step by step, we went on for a quarter of an hour, drinks alternating with hints, and hints with drinks, until we took another drink, and went into the yard to look at the sleigh. We had a fresh glass of nalifka when we returned from the yard, and another and another as the talk went on, until by the time the business was ended, and I had paid over the money, my unaccustomed head was whirling like a rifle-ball, and I would have found it difficult to see any difference between a sleigh and a side-wheel steamboat. My companion assured me that if we had gone at it in the blunt American way we would have spoiled the whole affair, and I should have been compelled to look elsewhere for a vehicle.

Whatever the Russian takes he holds, unless Fortune frowns upon him in her darkest way. Step by step he has advanced in Central Asia without retreating, and steppe after steppe he has taken and never relinquished. When the Tartars marched westward, under Gengis-Khan, seven hundred years ago, they formed settlements along the route, and planted fields of grain at each and every settlement. Their conquest gained in this way a permanent character, and they made their armies in a measure self-sustaining. The Russians conduct their warfare in much the same way; and when they have taken a position, they construct a fort, and start a farming settlement under its protection. All the Siberian Cossacks are mobilized, not the men alone, but the women, children, cattle, dogs, cats, and household furniture. When the Amoor Valley was occupied it was necessary to people it. Whole villages were ordered to move from the province of the trans-Baikal to the Amoor; every thing that could be transported was piled upon rafts and floated down the great river. When the destination, previously selected, was reached, a new village, with the same number of houses, the same inhabitants, and occupying the same relative positions, would spring up in place of the old one a thousand miles away. The government would pay the expense of transportation and that of new houses, and would indemnify the settlers for their loss by the abandonment of immobile property. A Cossack population can be moved at the will of the ruler, but a peasant one can not. When General Mouravieff made his plans for the conquest of the Amoor, he found that the population of the trans-Baikal province was mainly a peasant one; and in order to facilitate business, he asked, and obtained, an imperial ukase converting all the trans-Baikalians into Cossacks. This sort of thing can be done in Russia easier than in America. Suppose our government should attempt to move the population of Iowa into Dakota in order to make the latter wilderness blossom like a sunflower, wouldn't there be a precious row about it?

This is just what has been done in the Russian advance into Central Asia. During the reign of Catherine II., of blessed though somewhat scandalous memory, one of the governors of Siberia persuaded that estimable lady to give him all the conscripts of a single year instead of sending them into the army. He settled them with their families in villages through the Barabinskaia Steppe, and converted the whole lot of them into Cossacks. They made a line of forts on the southern edge of the steppe, and in the course of a dozen years or more a second line a hundred or more miles further south.

Whenever a new strip of territory was obtained from the Tartars, as they are erroneously called, a new line of forts was built, new villages were founded, new fields were planted, and the new frontier was fringed with settlements of an apparently permanent character. The Cossacks were quite as much in the service of the government when engaged in agriculture as when fighting in the field; in fact, they were more so, for the reason that the most of the Russian advances were made without bloodshed, and the villages of the soldier-farmers were of more consequence in the work of conquest than the forts, where they could rally in case of trouble.

In union there is strength, especially when the union is fortified by a fixed policy. Russia, great, populous, despotic, and diplomatic, was matched against the independent tribes and khanates of Central Asia, and it is easy to see what an immense advantage was held by the Black Eagle. Independent tribes are constantly liable to become unfriendly to each other, especially where there are loose notions in regard to property. The Tartars are more or less migratory in their habits; they are a pastoral people, and their wealth is mainly in cattle, sheep, and horses. Their migratory habits arise from the necessity of finding suitable pasturage for their flocks and herds, which are frequently of immense extent. The Kirghese, who formerly occupied and controlled nearly all of that part of Western Siberia south of and including the Barabinskaïa Steppe, are accustomed to pass their winters in some of the sheltered valleys of the Altai Mountains, where the snows are light, and the violence of the *bourans*, or wind-storms, is broken. In summer they descend to the valleys in the plain or undulating country, and frequently during the warm season they are obliged to change their locality. When the grass is eaten they move to an untouched spot, and when the fresh lot of grass is devoured they move again. Their troubles arise generally from two causes—disputes about the right to certain rich pastures, and raids made for thieving purposes. The Russians are constantly on the watch for any of these quarrels, and are not averse to helping them on. When two tribes are in dispute, the nearest Russian commander magnanimously offers his aid to the weaker. If it is accepted, he sends a company of Cossacks to the Kirghese leader whom he has taken under his wing, and then, partly by persuasion and partly by threat, he obtains a compromise of the difficulties, and puts the two tribes on their good behavior. The Tartar chief is delighted with his ally, and congratulates himself on the service he has obtained at no apparent cost. Now, to his surprise, he finds that the Russian does not manifest a disposition to go away, but, on the contrary, is willing to stay there permanently, and proceeds to build a fort. He—the Kirghese—discovers that if the Russian departs, his Kirghese rival will be ready to show fight, and take revenge for his humiliation. There is no alternative; the Russian must remain to save his ally from annihilation; for has he not come magnanimously and shrewdly to the aid of the weak against the strong? and if he goes away the strong will make things decidedly uncomfortable for the weak. He is not exacting and extravagant in his demands; he only wants a place for a fort, and some land around where he can raise a few cereals and keep his droves of horses and cattle. He makes no interference with the religion, laws, manners, and customs of the natives; he allows them to do as they please, and go and come when they like. His yoke is easy, but it is well secured, and in due course of events the tribe becomes Russian, and the territory it occupies floats the Muscovite banner.

In this way Russia has appropriated area after area of Asiatic soil, and remains on good terms with the original inhabitants. Her rule in newly conquered countries is never oppressive, as she knows very well how oppression leads to discontent and revolt. England and most of the nations of Western Europe would insist upon the introduction of their religion, but Russia, however earnest she may be in the cause of the Church, is too practical to be fanatical when dealing with Asiatics. In every part of Siberia one may see the natives worshiping God after the dictates of their own consciences, and their places of worship are never disturbed by the invader. I have seen in Siberia the mosque, the temple, and the church side by side, and the words of the muezzin calling the followers of Mohammed to prayer and praise mingle with the notes of the bells which assemble Christians for similar duty. The Polish exiles in Siberia, mostly Catholics, have their own priests and churches, the latter built and the former paid by the government, and among the Siberian peasants a Catholic church is invariably called Polish, while a Lutheran one is known as German. On a single avenue of the Russian capital you can pass in succession the churches of the Greek, the Armenian, the Lutheran, the Catholic, and the Episcopal faith. In Moscow, Kasan, and other cities formerly under Tartar rule you can find the mosque rising in all its glory and independence, and will see that the architecture of many of the Greek churches is wonderfully like that of the Orient. The holy men among the Mohammedan, Buddhist, and pagan subjects of the emperor receive the concessions granted to the priests of the Established Church, and in some localities they are partly paid by the government. The Asiatic is fanatical about his

religion, and would fight for it quicker than for any thing else—in many instances he has little if any thing else to fight for, and naturally may be expected to make the most of it. Russia has never deviated from her policy of making no interference with the religion of the people she conquers, and it is to this policy that she owes the possession today of many thousands of miles of land and thousands of loyal subjects.

The process of making a subject of a native heretofore independent is worthy of consideration. I had several opportunities to observe it, and was struck with its simplicity and effectiveness. No oath of allegiance is administered, and most of the novitiates would not understand it if it were attempted. The man is required to pay a yearly *yessak*, or tax (this is the requirement of every citizen of Russia from Behring Strait to the Baltic Sea), and when the tax is paid he is a citizen with all rights and privileges. In the settled portions of Russia the tax is generally in money, but the rule is very flexible. On the shores of the Arctic Ocean, and all through the aboriginal country in the extreme north, the *yessak* consists of one fox-skin. In Kamtchatka it was formerly one sable-skin, but since the advance in the price of the fur, and the decrease in the number of sables, one skin is taken for every four persons, who arrange the division among themselves. On the Kolyma River and on the Amoor the tax may be paid in fish, and the same is the case in other localities. The Kirghese pay in sheep and horses, these animals being legal tender in their region just as furs and fish are legal tender in the other localities I have mentioned. Don't smile, for it is really the case that such things circulate in place of money. At Kolymsk, on the Kolyma River, the government has established a savings-bank, not for money, but for dried fish. The *staroста*, or head-man of the town, is president, cashier, and secretary of the concern, and it is managed on the general plan of American savings-banks, with this difference, that every man is compelled to put a certain amount on deposit every summer, so as to provide against want during the winter.

I am reminded of a joke by a companion of mine, while we were traveling in the south of Russia. We were horribly annoyed by the fleas; they punctured our skins till we looked like animated nutmeg graters, and used to feed upon us with the greatest constancy. I was telling my friend about this mode of paying taxes. He was silent a minute or so, while scratching various parts of his body, and then said, with considerable emphasis, "These people ought to pay their taxes in fleas, as they have plenty of them, and nothing could be found that would circulate more rapidly."

Had this been the case, I don't think the government could have employed better tax-collectors than ourselves, as we found it impossible to be rid of the pests until we got out of the flea-haunted country.

The payment of the *yessak* is necessary before a native can trade at any of the posts or fairs throughout Siberia—that is, if he is a resident of the country claimed by Russia. When a fair is opened there is always a government official on hand to collect the tax, and with an eye to the interests of his ruler, he selects the very best article of the kind in which the *yessak* is paid. There is a pleasant fiction that the fox or sable skin is sent directly to the emperor, and is worn by him in person. Many a native of Siberia thus solemnly believes, and sometimes, moved by loyalty and rum, he sends a present, in addition to the tax, to his sovereign. The present generally consists of a valuable skin, and as the collector receives it he kindly remarks that he "hopes the emperor may get it."

Nearly all the tribes that have thus been added to Russia, and have become her subjects, have been benefited by the change. They have the advantages of commerce; they are protected against their more powerful neighbors, and are enabled to live at peace with every body. Few of them would wish to return to their ancient condition, and their relations with their rulers are rarely otherwise than harmonious. As Russia advances she establishes commerce, creates new wants among the people, and affords the means of supplying them, and shows in various ways that friendship with her is advantageous. The merchant accompanies her armies, and is protected and encouraged, though he is sometimes rather oppressively black-mailed by the commander or his subordinates. As the Russian flag has been carried southward, where the people are less nomadic, more powerful, and more fanatical than the Kirghese hordes, the policy has varied slightly according to the exigencies of each case, but only slightly. And this brings me to the more recent events in Bokhara and Khiva.

In the manner already described, that portion of Asia south of the Barabinskaia Steppe down to about latitude 45° was slowly absorbed by Russia. Intrigue was steadily kept up with the countries east of the Caspian Sea, and as a means of facilitating this intrigue concessions were sought which should permit Russian merchants to penetrate to all parts of the coveted territory. The commerce with these regions is conducted by means of caravans, which come annually, and sometimes semi-annually, from Central Asia to four distinct points in the Russian dominions. These points are Orenburg, in latitude 51° 46′ north, longitude 55° 4′ 45″ east; Troitsk, latitude 54° north,

longitude 61° 20′ east; Petropaulovski, latitude 54° 30′ north, longitude 69° east; and Semipalatinsk, latitude 50° 30′ north, longitude 80° east. Orenburg is the most westerly of these places, and is nearest to the great annual fair of Nijni-Novgorod. The caravans arrive at Orenburg, or attempt to arrive, in season for the transportation of goods to the fair. From Khiva to Orenburg the ordinary caravan time is about thirty days. Bokhara is sixty days' journey from Orenburg, and the route for a part of the way is the same to both places. The merchandise brought by the caravans consists of wool and woolen goods, silks, raw cotton, manufactures of leather, and a variety of dried fruits and preserves. Great numbers of horses and vast flocks of sheep are driven to Orenburg, where the horses are sold, and the sheep are skinned for their wool and hides, and melted for their tallow, the rest of the carcass being thrown away. Much of the Russian tallow that comes to this country has walked the plains of Central Asia, and the same is the case with Russian wool. The cotton-plant came originally from Central Asia, whence it has been distributed throughout the globe, and some writers say that it first became known to Western merchants at Khotan, an Asiatic city, once possessing great commercial importance, but now in a state of decline. One of the old chroniclers (Sir John Mandeville) draws the long-bow about the cotton-plant, which he described as the *boranez*, or sheep-tree. "It grows," said he, "upon the hill-sides, and sometimes becomes tall like a small tree. It produces wool, and has eyes, ears, and horns. When it is disturbed it utters a sound that is often mistaken for the bleating of a lamb." What a lovely liar was this same Sir John Mandeville!

More goods are brought to Orenburg than to the other three points I have mentioned. The arrival of a caravan there makes a busy scene. The broad but badly paved streets are full of people, camels, horses, sheep, bales, bundles, dogs, dirt, and stenches; the Orient jostles the Occident; the Moslem utters his prayers to Allah side by side with the Russian, who seeks the favor of the same Divine power; there is a babel of tongues that might confuse the greatest linguist of the century; and there is the sound and bustle of the traffic of a whole year concentrated into a few days. If the weather is dry, there are clouds of dust that fill and thicken the air, and hang like a pall over the city; and if rains have fallen, there is a sea of mud, in which men and animals wade, and occasionally sink. The range of the thermometer is great, and the changes are sudden: a blast to-day, hot as the sirocco, may come from the Turcoman steppes in the south, while to-morrow may bring a gale from the north laden with the glacial chill of the frozen ocean. The kneeling camels alternate with restless and half-wild horses, and quite frequently there is a commotion among the animals, resulting in damage to property, and a general volley of profanity in the combined languages of the East and West. Costumes may be studied along with manners and habits. The Bokhariot, with his flowing and loose-sleeved robe, stands in converse with the Armenian, with his conical cap and wide trowsers, and the Russian, with his lower garments of European pattern, and his caftan, which reminds you very forcibly of an Ulster overcoat. Cossack policemen wander through the crowd, and keep a sharp eye on those who may be thieves or disturbers of the peace. In the open square which forms the market-place there are huge piles of merchandise waiting to be received in the warehouses, or transported to the fair at Nijni. On rare occasions a traveler from Western Europe may be seen, attracting attention by the strangeness of his dress, and sometimes by the open-mouthed curiosity which he manifests.

The fairs of Russia are arranged at different periods, so as to accommodate the merchants who wish to travel from place to place. That of Nijni-Novgorod, the greatest in the world, and having an annual trade of three hundred millions of dollars, opens on the 1st of July (O. S.; 13th, N. S.), and lasts sixty days. Three months earlier there is a smaller fair at Orenburg, so that goods may be bought there and sent to Nijni. In January there is a great fair at Irbit, in the Ural Mountains. I have reason to remember this fair, as I was delayed and vexed and several times overturned by the hundreds of sleds and sleighs on the Barabinskaïa Steppe, carrying goods to Irbit. A fortnight after the fair at Irbit there is one at Minalinsk—which likewise inconvenienced me in traveling—and so they go on throughout the year at various places, all having reference to the great fair at Nijni. The arrivals of the caravans at Troitsk, Petropaulovski, and Semipalatinsk are timed with reference to the fairs, and the scenes are much like that I have described at Orenburg, though on a smaller scale.

In the course of time Russian merchants were allowed to penetrate Central Asia. The most intelligent of them were required to report all that they saw and learned, and on frequent occasions Russian officers in the guise of merchants were detailed to visit all the principal cities. In this way the government obtained ample information, and was able to know with sufficient accuracy the military strength of each khanate, the character of its ruler, the topography of the country, its resources, natural and artificial defenses, and, in fact, every thing necessary either for a war or an intrigue. The latter was always preferred, and it seemed

the fate of the Asiatics to be in perpetual quarrels that greatly favored the Russian schemes. Now the Emir of Bokhara was at war with Khokan, next there would be trouble between Khiva and Bokhara, and again Khokan and Khiva would be at each other's ears. Unruly sons made unpleasant family jars, and subordinate heads of tribes were constantly in revolt. Not a year passed without expeditions of some sort, and frequently there might be a dozen of them in as many months. The ruler might go out to chastise a refractory neighbor, leaving his son or brother as regent during his absence. Every thing would be serene at his departure, but on his return, especially if he came back defeated, he would very likely find the gates of his city closed against him, and the regent converted into an actual ruler. Sometimes a commander would go over to the enemy, and sometimes the enemy would go over to him. Assassination was not uncommon, and occasionally an ambitious son, tired of waiting for his father to die, would administer poison to the old gentleman, or insert a knife into his jugular vein. Every occupant of or heir to a throne was anxious to achieve the fame of Gengis-Khan or Timour, and become a "World Conqueror," and was rarely fastidious about the means of achieving it. And so it went on year after year, and the wily Muscovite watched his opportunities, and never neglected to embrace them too.

In 1826 there died at Bokhara (city) Emir Said, and immediately after his death his son Husein ascended the throne, and became khan. His younger brother Nasrullah was ambitious of honor, and so he caused Husein to be poisoned, after a reign of less than three months. Another brother, Omar, came into the field as a claimant, naturally thinking that he had as good a right to steal a throne as any body else. Nasrullah captured Samarcand, and then marched upon Bokhara, which he besieged and took. Omar fled to Khokan, where he died of cholera soon after. Nasrullah was determined to have peace, and so he executed in cold blood three of his younger brothers and a great number of the adherents of his former rivals. This was sufficient to secure the quiet which he so much desired, and he announced that he was determined to follow in the footsteps of his father—whom, by-the-way, he was suspected of having poisoned—and make the happiness of his subjects and the strict supervision of religious observances the great object of his life. He was a pious old scoundrel, and while indulging in the greatest atrocities he always prated about his love of Islamism and his reverence for the Prophet of God. He made his ministers faithful to him by helping them to amass fortunes, but as soon as they had gained a sufficient amount of this world's goods he ordered them to be beheaded, and appropriated the property to himself. He was a model family man, as he had a facetious practice of murdering his wives whenever he tired of them, and consequently was not regarded as a "good catch" in the matrimonial line. He kept a secret police so numerous and so watchful that nobody dared say any thing against him to his most intimate friend, and it is said that at one time a man dared not even think any thing except good of the emir. He had all the vices that were ever possessed by any ruler since the days of Adam in any country on the face of the globe, and the story of his indulgences would hardly be suited to the pages of any modern publication. Those who offended him were burned in ovens, flayed alive, flung from towers, or otherwise disposed of. One of his favorite entertainments was to bind a victim hand and foot, and then throw him into a cell or box which contained many thousands of sheep-ticks. The sufferings of the poor wretch would be horrible beyond description.

It was while Nasrullah occupied the throne that Russia, having absorbed the wide region between Bokhara and the valleys of the Obi and Yenisei, made her appearance on the borders of his territory. While occupied in the most disgraceful profligacy and tyranny, Nasrullah had been constantly at war—now with Khiva, now with Khokan, and now with various tribes and divisions of his own subjects. Though no man in his reach dared breathe a word against him, his power had been greatly weakened, and his subjects were discontented with his rule. He had sent several expeditions against Khokan, and though some of them were successful, the majority were defeated or given up through treachery.

While one of the expeditions was returning defeated from Khokan, and another from Khiva, Nasrullah heard that the Russian outposts were on the right bank of the Jaxartes, a river forming the northern boundary of Bokhara, and flowing into the Aral Sea. Russia had several times attempted to negotiate with him, and had sent embassadors with valuable presents, but in every case he treated the embassadors with disrespect, and sometimes threw them into prison. Two English embassadors, Colonel Stoddart and Captain Connolly, went to Bokhara, and were murdered by the emir, the former after four years' imprisonment, during which he was frequently tortured, and the latter, more fortunate, after an imprisonment of about a year. Stoddart was at one time promised his freedom if he would accept Islamism, and to save his life he consented. But the treacherous emir continued to torture him, and on the 17th of June, 1842, according to the account given by M. Arminius Vámbéry, the two victims were

ordered out for execution in the open square of Bokhara.

First the head of Stoddart was struck off. Then the executioner paused before Connolly, and the emir told him his life would be spared if he would embrace the faith of Islam. "No," said Connolly; "I prefer to die. Stoddart became a Mohammedan, and still you have executed him. Complete your work."

As Nasrullah advanced in years he seems to have become more blood-thirsty than in his youth, if such a thing were possible. He fancied that conspiracies were going on around him, and consequently he doomed hundreds to death. While in his last illness news reached him that his brother-in-law, who had long been in open revolt, had captured one of his fortresses. Hardly able to speak, he commanded that his wife should be brought to his bedside. She begged for mercy, but the dying tyrant could not be moved. With his last words he ordered that she should be beheaded, and he drew his final breath while gazing on the blood which flowed from her headless trunk. He died in 1860, after a reign of thirty-four years.

The Russian advance into Khokan and Bokhara began with the unfurling of the flag of the Black Eagle on the banks of the Jaxartes in 1839. General Peroffsky commanded the operations in that quarter, and was evidently instructed to make haste slowly and surely. No great advance was made for two or three years, but a fort was built on the banks of the Aral Sea, and several strong positions were secured. Most of this region was nominally or really ruled by Khokan, so that while the attitude of the Russians toward Khokan was hostile, it had an air of friendliness, rather thinly disguised, toward Bokhara. Things went on in comparative quiet for nearly a decade, the Russians gradually making encroachments, and the Khokandians doing nothing serious to oppose them. Fort Aralsk was built at the mouth of the Jaxartes in 1847, and occasional scouting parties penetrated into Khokan and Bokhara.

In 1852 a small force under Colonel Blaramberg made a most daring reconnaissance nearly eight hundred miles from the Russian frontier, and up to the very walls of the fortress of Ak-Mesdchid, and returned in safety, though considerably annoyed by the scouts of the enemy. In the same year steamers were placed on the Aral Sea, and in 1853 the first great advance to the southward was made. An expedition was prepared consisting, according to the records, of 2168 men, including officers, 2442 horses, 2038 camels, and 2280 oxen. When all was ready the column started for Ak-Mesdchid, on the right bank of the Jaxartes, and was followed in the river by the steamer *Peroffsky*. The heat was intense, sand-storms were frequent, the sands were hot, the air was full of swarms of locusts, and it was difficult to find forage for the animals. But the determined Russians pushed onward and invested the fortress.

General Peroffsky drew up a summons to surrender, and couched the document in language thoroughly Oriental. The following is its text:

"*From the Governor-General of Orenburg to the Commander of the Fortress of Ak-Mesdchid:*

"By order of my master, the Emperor of all the Russias, I have come here to take possession of the Fortress of Ak-Mesdchid, which the Khokandians have erected on Russian territory for the oppression of the Kirgheses, subjects of his Imperial Majesty.

"Ak-Mesdchid is already taken, although you are inside it, and you can not fail to perceive that, without losing any of my men, I am in a position to destroy every one of you.

"The Russians have come hither not for a day, nor yet for a year, but forever. They will not retire.

"If you wish to live, ask for mercy; should you prefer to die in Ak-Mesdchid, you can do so. I am not pressed for time, and do not intend to hurry you. I here repeat that I do not come to offer you combat, but to thrash you until you open your gates.

"All this I would have told you on the first day of my arrival, when I approached the walls of your fortress unarmed, had you not treacherously opened fire on me, which is not customary among honorable soldiers.

(*Signed*) "PEROFFSKY."

The Khokandians refused to surrender until the last grain of powder in their flasks was burned, and the hilts of their swords and the heads of their spears were all shattered. The Russians pressed their work vigorously, and the fighting was obstinate on both sides. The Russians had a good supply of artillery ammunition, and kept up a steady bombardment, from which the garrison suffered severely. On the 8th of August a storming column entered the fortress. The Khokandians fought so valorously that very few of them escaped. The place was not surrendered until the commander and nearly all the superior officers were killed. The Russian reports of the campaign accorded the highest praise to the defenders, and the affair is notable for being the first and last where the Central Asiatics displayed real heroic courage in their efforts to expel the Russians.

For three or four years the Khokandians made occasional attempts to retake Ak-Mesdchid; the most serious of these was from December 14 to 17, 1853, when they sent an army of 12,000 men, which was not only held in check but put to flight by 600 Russians. The Russian encroachments continued; fort after fort on the Jaxartes was taken; the invaders advanced steadily into the populous parts of Khokan, and in June, 1864, the town of Turkestan passed from the Crescent to the Cross. Up to this time Bokhara had not been seriously disturbed, but in 1865 Mozaffur-eddin Khan, the successor of Nasrullah—we will call him Mose for sake of brevity—sent an insolent letter to Gen-

eral Chernayeff, the successor of General Peroffsky, commanding him to evacuate the conquered territory. To give weight to his letter he confiscated all the property of Russian merchants in Bokhara. The Russians retorted by confiscating the property of Bokhariot merchants at Orenburg. Mose sent an envoy to St. Petersburg, to explain matters, but he was arrested on the road and imprisoned. The Russians sent at the same time an envoy (Colonel Struve) to Bokhara; very naturally Mose ordered him to be imprisoned as his own envoy had been, and he was shut up in a house in the middle of the city. General Chernayeff was angry at this indignity to his embassador, and with more bravery than discretion marched across the desert to Djizzak, the first place in the actual territory of Bokhara. Here he met a force twenty times as great as his own, and retired without giving battle. The only wonder is that he managed to save any part of his forces in a hot, arid country, and surrounded by hordes of warlike Tartars.

Mose was encouraged. He gathered an army of 45,000 men, with twenty-one guns, and marched against the Russians, who were only 4000 strong. On the 20th of May, 1866, a battle was fought at Jirdjar, on the left bank of the Jaxartes, a few miles from Khojend, and resulted in complete victory for the Black Eagle. The emir's entire camp and baggage, his personal outfit and park of artillery, fell into Russian hands, and Mose himself narrowly escaped capture. The Bokhariots lost about a thousand men out of 45,000, while the Russian loss in killed and wounded was less than fifty!

The Russians vigorously followed up their victory. Djizzak, the frontier fortress between Bokhara and Khokan, was taken a few months later, and other important points shared its fate. In 1867 General Kauffman, who had been assigned to the command of the Russians on the Jaxartes, sent out several scouting parties, but made no formidable advance into the coveted territory. It was not fear, but caution, and possibly orders from St. Petersburg, that restrained him, as he was known to be a bold and energetic officer, who had passed a large part of his military life in Asia. It was not my good fortune to encounter General Kauffman in Siberia, but I met many of his personal friends and acquaintances, and by one and all he was commended in the warmest terms.

The order to march on Samarcand was given early in 1868. General Kauffman's command embraced about 8000 men, with sixteen guns, and on the 13th of May it stood in sight of the city. A Bokhariot army 40,000 strong, and a river, fortunately not deep, separated them from the coveted prize. Wading breast-high in the water, the left wing, and then the whole army, crossed in face of the enemy, who ran away, leaving all their artillery, as soon as the first battalion of Russians stood on solid ground before them. The authorities of Samarcand closed the gates against the fugitives, and sent a deputation of the principal citizens to invite the Russians to enter, which they did next day.

Thus fell Holy Samarcand, once the favorite city of Tamerlane, and the stronghold of Islamism. The Mohammedan faith received a most terrible blow in the capture of Samarcand, and the humiliation of all Bokhara, which followed speedily. The occupation of Mecca by the infidel could scarcely be more serious, and it is no wonder that Mohammedan countries have, since the fall of Samarcand, been buried in deep sorrow. A few years ago a Christian could enter these cities of the East only at the risk of his life. To-day Russian subjects may travel in all parts of Bokhara and Khokan, Russian merchants may dwell in the cities or appoint agents to represent them, and they may pass and repass freely to visit other countries. The shadow of the Black Eagle is over the land of Mohammed, and all the prayers of the faithful can not dispel it.

Bokhara and Khokan submissive, Russia next turned her attention to Khiva. Churches, clubs, warehouses, and newspapers were established at Tashkend and Samarcand, and for the first time in twelve hundred years the chant of the muezzin was broken by the sound of the Russian bells. Why should not the same blessings be showered upon Khiva?

Khiva is the most powerful of the three khanates, and it was not well to attack her until the other two were out of the way. But as soon as they were under the Russian flag the same series of intrigues that resulted in their downfall was begun against their more powerful neighbor. The Russian forces on the frontier were strengthened, the Khivan troops were harassed, and a wide section of the desert was "annexed" by proclamation, just as we have seen that Ak-Mesdchid was proclaimed to belong to Russia. When the Muscovite wishes to pick a quarrel he does not mince matters. He reminds you of the fight-hunting Irishman at Donnybrook when he proclaimed, "I've chalked a band all round my hat, and challenge any body to say it's not gold-lace," or of that other Celt who supplemented his outer garment till it trailed a couple of yards behind him, and then tendered the invitation, since perpetuated in song, "Jist trid on the tail o' me coat." Æsop must have been considering Russian policy in Central Asia when he constructed the fable about the wolf accusing the lamb of disturbing a stream by drinking below him. While I am writing these lines a dispatch comes from St. Petersburg announcing that bands of Khivans have been making raids into Russian terri-

tory, and that it will be necessary to chastise them for their insolence!

The conquest of Khiva is a certainty, and from my knowledge of the policy and prowess of Russia, and the extent of her preparations, I shall be disappointed if the Russian flag does not wave over Khiva by the time this article comes from the hands of the printer. The emperor will extend his dominions as rapidly as possible, and after Khiva has fallen there is fair ground for expecting the conquest of Afghanistan. Plenty of time will be taken, though something may occur to induce haste. In such case Russia will not be found wanting. The conquest of Central Asia up to the frontiers of British India is likely to be made within the next ten or twenty years, and possibly it will be accomplished in the present year.

That the Russians will attempt to push into India I do not believe; they have no wish to provoke a war with Great Britain by any aggressive movement. What the latter power holds she may keep; Afghanistan may become a bone of contention, and possibly Russian and English troops may meet in her territory, but they are not likely to fight it out there. The dispute that arises is more likely to be settled by diplomacy than by war, unless England takes the aggressive. Besides the conquest of Central Asia, Russia seeks to establish a port on the Indian Ocean; she already has a project for a railway to India, and the subject of navigating the Oxus and Jaxartes has long been under consideration. The chief difficulty in the way of running boats on the Oxus is the absence of water for several months of the year in some parts of the river, and the daily shifting of the sandy channel in other parts. Water is generally regarded as a *sine qua non* in steam navigation, and for most practical purposes the Oxus is useless. The Jaxartes is somewhat, though not much, better, but it has not yet been determined to what extent it is available. The railway is the only certain means of rapid communication, but the distances are so great and the local resources so few that it can not be looked for at present.

The khanate of Khiva is defined by the geographers as lying between latitude 36° and 45° north, and longitude 52° and 64° east, bounded north by the Kirghiz Steppe and the Aral Sea, east by Bokhara and the Kizikum Desert, south by Khorassan, and west by the Caspian Sea. It has an area of 150,000 square miles, and a population estimated at 2,000,000. Most of the land is an arid desert, and the fertile portion of Khiva is mainly along the Oxus, where there is considerable agriculture. Cotton is extensively cultivated, and great numbers of sheep, goats, horses, and dromedaries are raised. Silk, cotton, and woolen fabrics are made, and large quantities of the raw materials are exported to Russia by caravans. Most of the work is performed by slaves, and the capital of Khiva is a great slave mart.

The Russian conquest will doubtless break up this traffic, and it is for this reason that Persia favors instead of opposing the Muscovite ambition. More than twenty thousand Persians are held in bondage in Khiva; occasionally these slaves escape to Russia, and are protected, and it is this protection of fugitives which has caused much of the ill feeling between Russia and Khiva. In Barnaul, Western Siberia, I saw several persons who had thus escaped, and from the lips of one of them, an officer of the Persian army, I heard the terrible story of his sufferings during a seven years' captivity, and of the cruel treatment visited upon him and his fellow-prisoners.

Khiva, the capital, is situated on a plain near the Oxus, has a population of a little over 12,000, and is surrounded by mud walls, easily broken by the modern appliances of war. The Turcoman slave-hunters bring their captives to the city, where they are sold in the public square in the same way that slaves are sold at the barracoons on the African coast. Sometimes when tribes in various parts of the khanate are in revolt, the troops of the emir are sent to chastise them. The heads of the slain are brought in by the victors, and paid for at stipulated prices. The prisoners, such as are under forty years of age, are sold into slavery; the old men are beheaded or tortured, according to the will of the khan. Vámbéry thus describes the treatment of a party of rebel prisoners brought into Khiva at the time of his visit: "The young men were chained together by their iron collars in numbers of ten to fifteen, and led away; the old men awaited submissively the punishment awarded to them. While several were led to the gallows or the block, I saw how, at a sign from the executioner, eight aged men placed themselves down on their backs upon the earth. They were then bound hand and foot, and the executioner gouged out their eyes in turn, kneeling to do so on the breast of each poor wretch; and after every operation he wiped his knife, dripping with blood, upon the white beard of the hoary unfortunate."

The Khivans have all the appliances of torture known to ancient or modern times. The bare enumeration of them, with the briefest description, would cause the most stoical of readers to shiver with horror.

Humanity will be greatly benefited by Russia's absorption of Khiva. The Crescent must give way to the Cross, and the mercy and love taught by the Nazarene must be substituted for the cruelty enjoined by him who preached death to unbelievers, and spread his religion with fire and sword.

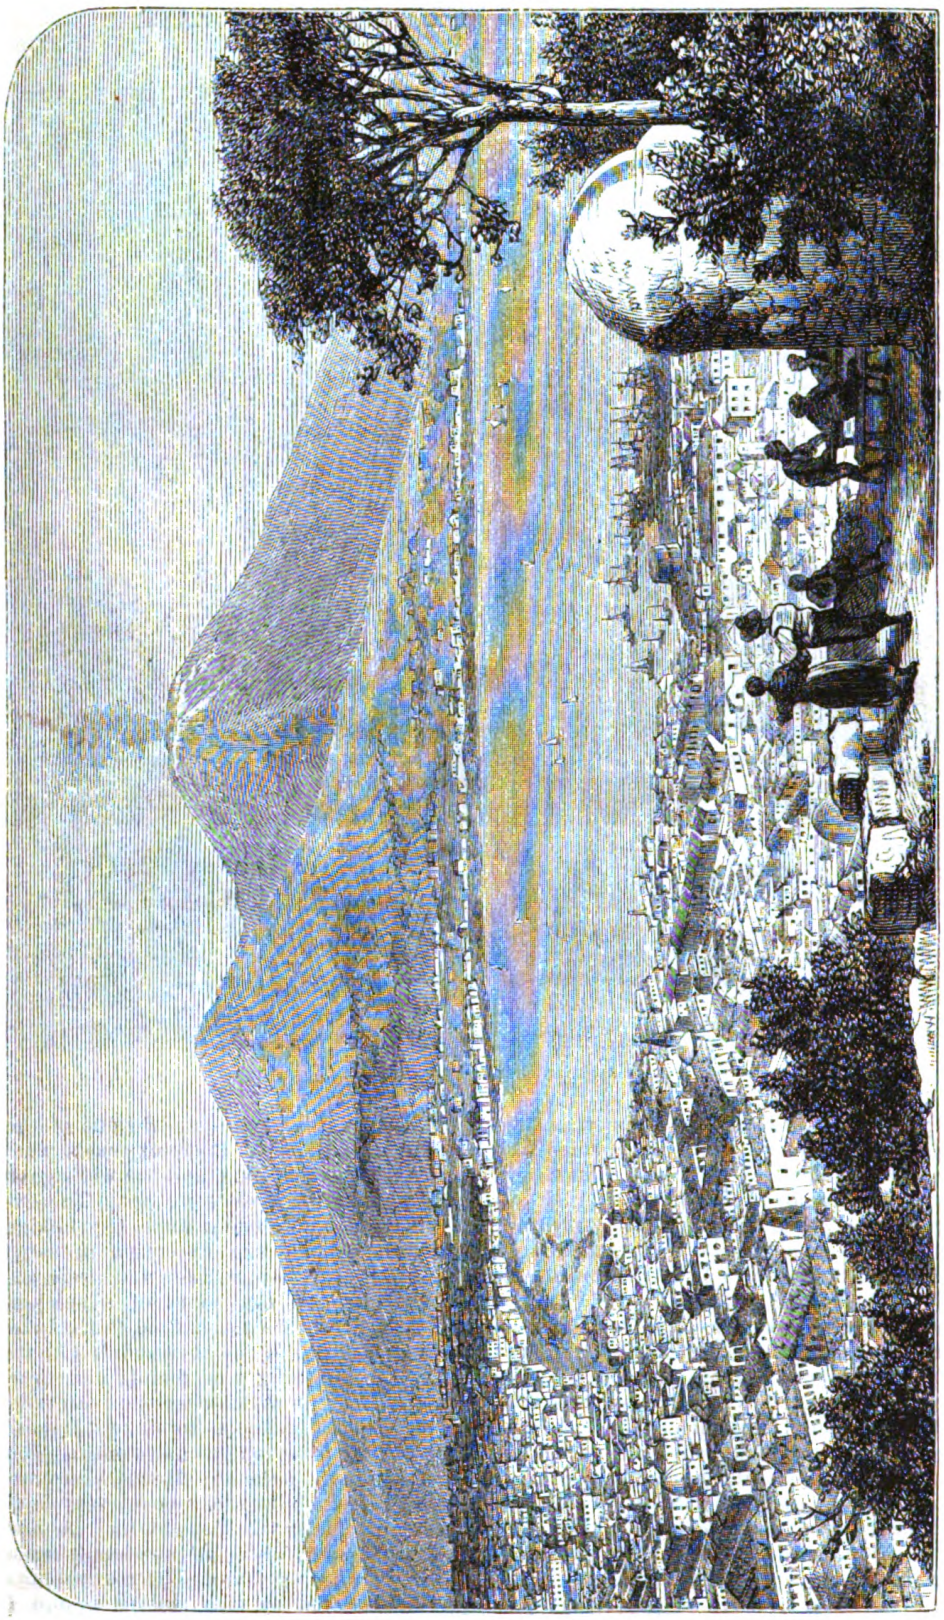
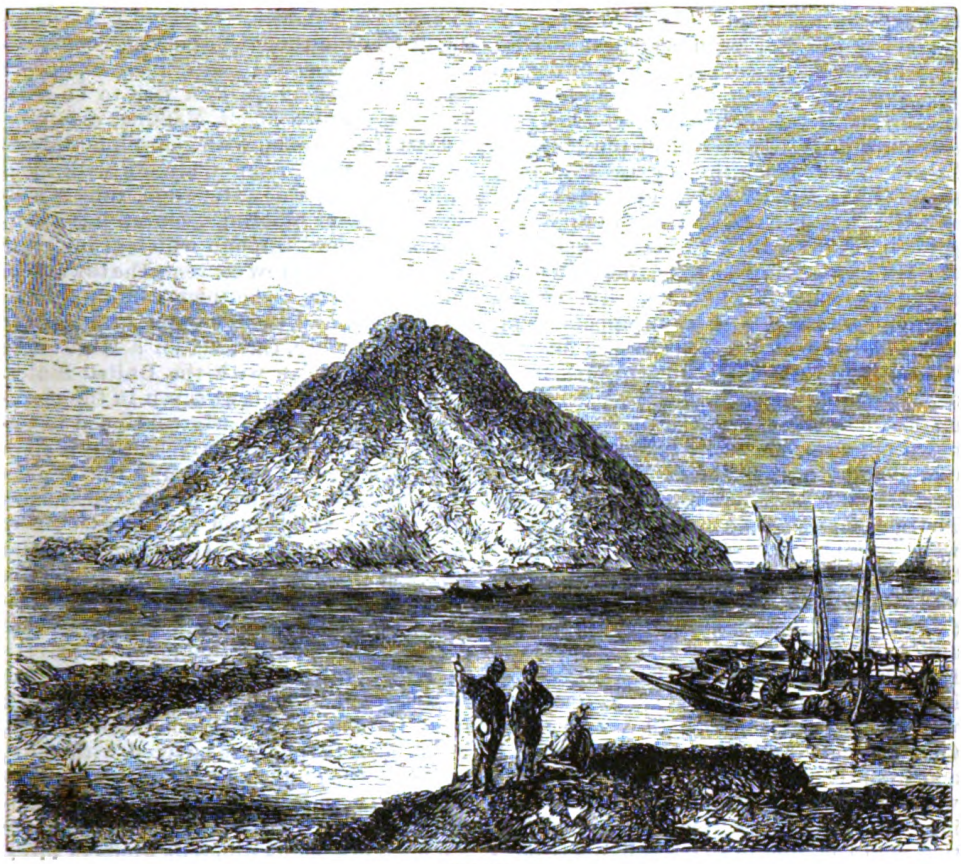
GENERAL SHERMAN IN EUROPE AND THE EAST.



[First Paper.]

GENERAL SHERMAN AT POMPEII.



ON the 21st of February of last year General Sherman and his party, consisting of Colonel Audenried and Lieutenant Grant, arrived in Naples from Rome, at which latter place they had passed two very pleasant weeks. Upon the same train which brought them from Rome were Mrs. Washburne, the wife of the United States minister to France, and several Americans, all of whom were seeking the mild climate of Naples, Sorrento, and other equally agreeable places. Naples was full of travelers, and it was with difficulty that hotel accommodation could be provided for the arrivals of each day. The general and party remained but one week in that city, but during this time many of the places of interest were seen. An excursion was made to the ruins of Pompeii, during which a special excavation was made. Quite a large number of Americans participated in this picnic; and in one of the ancient buildings of Pompeii toasts were drank, songs were sung, and the walls gave back *Sherman's March to the Sea*. The excavations did not bring forth any hidden treasures. With the exception of some broken tiles, wâter-jugs, a few buckles, some copper coin, and the bones of a chicken which may have been sacrificed to the hungry manes of one of the ancient inhabitants of the city, nothing was found; and even these indifferent articles were so carefully watched by the police as to make it impossible to take away one as a souvenir. The party made the ascent of Mount Vesuvius, and wandered about the cone in very dangerous proximity to its mouth. A few days afterward Vesuvius was emitting a stream of burning lava. The general was quite exhausted by this excursion, and I

STROMBOLI.

doubt if the marches of the war so completely fatigued him. The evening of that same day he and his companions dined *en famille* with the Grand Duchess Olga of Russia, wife of the Grand Duke Michael, who was visiting Naples for her health. The dinner was very pleasant, and the Grand Duchess proved herself to be a most agreeable and cordial hostess. She had at table, besides the American party, her two or three ladies of honor, and four of her children, three boys and a girl. The conversation was lively, being carried on in English, which language the Grand Duchess speaks quite fluently. A more kindly lady or a better behaved family of children it would be very difficult to find. Victor Emanuel had been absent from Rome during General Sherman's visit there, and when he reached Naples the king soon afterward came also, and upon the application of the United States consul at that place signified his desire to receive General Sherman and party. The reception was very informal, the party being in walking dress, as prescribed in the invitation. Arrived at the palace, they were shown up a handsomely carpeted and wide staircase, being preceded by two servants in very gorgeous red livery, to the second floor. Passing along a wide corridor, they entered an anteroom, and were then conducted into a smaller room, in which was the king, Victor Emanuel, who came forward a few steps and shook hands with the general. With the exception of an aid-de-camp, he was alone. His majesty asked the general many questions regarding his journey, the American army, etc., and was very cordial. The interview lasted about ten minutes, the parties standing, and the conversation was in French. His majesty was dressed in plain black clothes, with a large shirt collar turned down over his vest, and cut quite low at the throat. He is a man of about fifty-five years of age; weighs at least two hundred and fifty pounds; brushes his hair straight back from his forehead; wears a large mustache, which is curled and waxed at the ends, and a long imperial; has a florid complexion, large and full eyes, which he rolls very much, a large hand, and is by no means a handsome man. He was very affable, and at the departure of the party shook hands with each one, and wished them a "bon voyage." On former occasions the general had been presented to his sons, the King of Spain (and wife) and the Prince Royal of Italy.

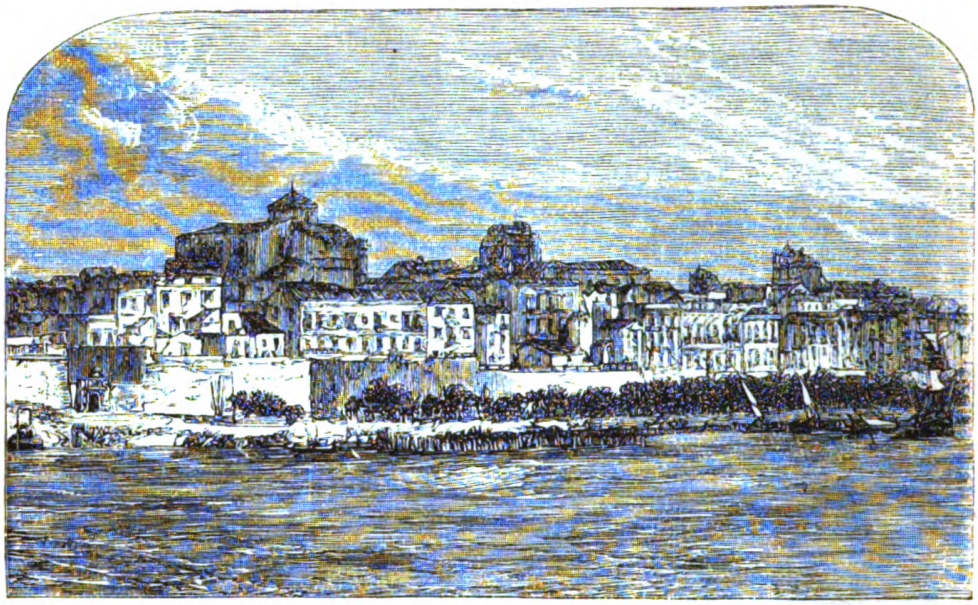
When General Sherman left Washington he had been promised that one of the men-of-war of the European squadron should meet him at Naples and carry him to Egypt. This was still further confirmed by the admiral when the general left Nice. For several days after the arrival of the party at Naples each morning the bay was examined to see if the *Wabash* or any of the fleet had arrived; but each day they were disappointed, until finally a dispatch came from the admiral saying that he had been directed to remain about Nice. To General Sherman this was a great disappointment, as he had intended to visit Greece and the "Isles," and to cruise about the Mediterranean, stopping at such places as his fancy might dictate. There was no help for it, however; so passage was taken in the regular evening boat for Messina, and on Friday, March 1, they left Naples at 9.30 P.M. The steam-ship company (Floria and Co.) were very obliging, and placed at General Sherman's disposal the cabin on deck, which was intended for six persons. The steamer *(Ætna)* was English built, and very clean and comfortable. The captain spoke some English, and had made a voyage to New Orleans, having been there just as the civil war commenced. About 10 A.M. the day after leaving Naples Stromboli was passed, and from the crater, which is on the northwest side of the mountain, smoke was issuing. The island rises from the sea some four thousand feet, and in shape is like a truncated cone. On the east side about its base are a few houses. About 12 M. the Straits of Messina were approached, while on the right was the undefined site of Charybdis, and on the left the rock of Scylla. The current runs through the strait south, and meeting with the wind, which, blowing from that direction, forces the water through the strait contrary to the current, causes in a storm quite a heavy sea at this point, and hence the danger to the badly constructed vessels of ancient times. The strait is just one mile wide at the northern entrance, between the Calabrian coast and Sicily. By 1 P.M. the *Ætna* reached the snug artificial harbor of Messina; and as the American consul had been telegraphed from Naples that the general was coming, his flag, as well as the flags of several American vessels in the harbor, were flying, making the party feel as though they were among friends. The consul, with the captains of these vessels, met the general as he landed on the quay. Accommodations were taken at the Hôtel Vittoria—quite a good hotel. The *Ætna* continued on to Palermo. The steamer for Malta was to come from Palermo, and after touching at Messina and Syracuse, continue on to its destination.



General Sherman determined to go by railroad, as there was one, to Catania and Syracuse, and at this last-mentioned place to take the steamer. Soon after his landing at Messina the major-general commanding the forces called and offered him every facility for seeing all that was to be seen. The party drove about Messina, a city of 100,000 inhabitants, with many fine houses and clean, wide, regular streets with sidewalks. Along the water-front runs a continuous row of buildings, containing dwellings, stores, etc., through which at intervals run streets. This row conceals the town from the water view. The town contains a fine opera-house, and, though quiet, is altogether a pleasant place, carrying on a large trade in fruit and wine with the United States. By a train which left at seven in the morning the general and party continued to Catania, and when they arrived at the station found the general commanding the brigade of troops there awaiting General Sherman's arrival, he having been telegraphed to by his chief at Messina. General Cavalchini took the general in charge, and drove him to every place of interest. The conversation was carried on in English through the general's aid-de-camp, Lieutenant Scambeti-Gott. Catania* is about two-thirds the size of Messina, and built upon old lava. Back from it about ten miles is Mount Ætna, which at this time was covered with snow, and from the crater of which smoke was issuing. There is in the town a small garden called the Villa Berlini, in which there are monkeys, many different kinds of birds, a camel, etc. The garden itself is a very pretty spot. The principal street is called Ætna, and is about one and a half miles long, at the end of which, on the bay, is another small park, in which a band was playing. The day being Sunday, the streets and gardens were full of pedestrians. The upper classes were European in their dress, but the middle and lower classes wear a kind of cloak of black silk, which, covering the head, reaches half-way down and over the dress. There is a small square in Catania which has been named, in honor of Mr. Lincoln, Lincoln Square. In the evening the party continued on to Syracuse, which place was reached in three hours. When they arrived at the station the colonel commanding was awaiting them with carriages, and conducted them to the hotel, where rooms had been engaged by him and supper ordered. The railway station is some distance from the town, and it seemed in the darkness and rain as though one would never finish passing over draw-bridges and through fortifications. The next morning, in company with a lieutenant-colonel of engineers, the party visited the ruins of Ne-

* This and several other places mentioned in this article are illustrated in the paper on "Sicily and the Sicilians," p. 188 to 202 of this number.

SYRACUSE.

opoli, which once formed part of ancient Syracuse. The form of the Greek theatre is still complete, as also the amphitheatre. Near by are the tombs, these consisting of a street cut through the soft rock, on each side of which were places carved out for burial. Near to these again is a cave, with a hole in the top, reached by steps from the outside. This is called the "Ear of Dionysius," where he is said to have learned the plans of hostile conspirators. Passing from this, one comes to what is called "Paradise." This is the remains of what was once an immense stone-quarry, now well cultivated. In ten minutes from Paradise the catacombs are reached. These consist of long galleries dug through the soft rock under the ground, and extend, in all their windings, some thirty miles. On each side of these galleries have been dug out places for the dead, now, however, no longer used, and generally empty. Where the bones of the original tenants are no one now knows, and heathen and Christian, who in turn have filled them, have for ages been forgotten. The temple dedicated to Bacchus stands not far away, and under it has been discovered another, the oldest Christian church in Sicily. Once used by the heathens, it was converted into a church having the form of a Greek cross. Here St. Paul preached on his way to Rome, and in it is the column at which St. Martin suffered martyrdom, and also his tomb. The party visited the scene of Marcellus's attack upon Syracuse, and, in another direction, the Benedictine Monastery, near by which is an immense quarry, the sides of which are some hundred feet high. Entrance into this is by the road near the monastery; and where the blood of 7000 prisoners once deluged the earth are now growing lemon and orange trees in abundance, covered with fruit. Hollowed out in the side of the soft rock is a tomb, and on the tablet this inscription, "Richard R. Nicholson, midshipman U. S. Navy, died Sept. 18, 1804." There, in a lonely corner, far away from his native land, rest the remains of one who lost his life in a duel.

Syracuse numbers about 20,000 inhabitants. It is built on a point of land, and inclosed by extensive fortifications. The streets are narrow and very dirty. There is a beautiful harbor—indeed, one of the finest seen in our trip—but there is no business; consequently the steamer going to and from Malta is about the only vessel that is seen. The Captain of the Port placed his boat at General Sherman's disposal, and in it he visited the stream along which grew in quantities the papyrus of the ancient time. This is a long reed, which, being cut open, the pulp extracted, cut into thin slices, dried, and then sewed together, furnished the ancients with their writing-paper. The scenery about Syracuse is very beautiful, particularly the valley bordering on the stream upon which the papyrus grows.

The steamer from Palermo arrived in the afternoon, and in the evening the party left in her for Malta. This vessel, the *Scylla*, like the *Ætna*, was very clean, and the captain was very polite. Indeed, from the time General Sherman entered Italy up to the time he left Sicily the officials of the Italian government, from the king to the Captain of the Port at Syracuse, had been most courteous and friendly in their manner toward

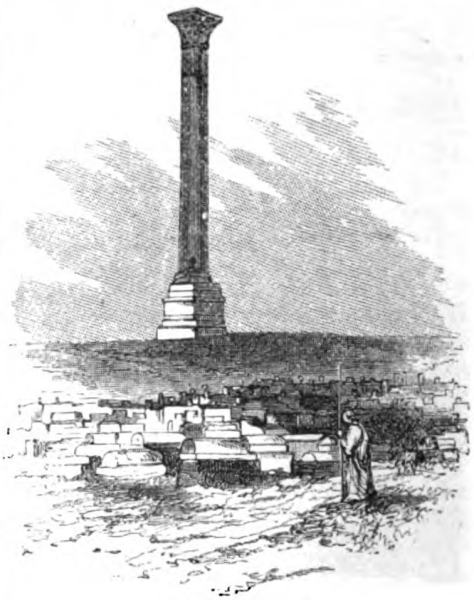
PAPYRUS PLANT.



him. The morning after leaving Syracuse the party came in sight of Malta, which presents a very different aspect to Sicily. Instead of the green verdure and trees of the latter, the soil is parched, and the only trees, aside from the orange and lemon, are scrub oak. Valetta, the chief city, which receives its name from the knight defender of Malta, is built upon a tongue of land that runs out, leaving a very snug harbor on each side. It is very strongly fortified, and these fortifications are being improved and strengthened every day. With the exception of the French frontier, this was the only place in all the general's travels where the party were compelled to show their passports. Sir Patrick Grant, a fine, tall, soldierly old gentleman of sixty, was in command as governor, and received the general and party very politely. He is very satisfactorily located in the old mansion of the Grand Master of the Knights of Malta, and in this he entertained the party at dinner one evening, there being some forty guests present, among them the Prince and Princess of Bourbon—he the nephew of the ex-Queen Isabella, and since mixed up in the Carlist insurrection in Spain; she the niece of the King of Portugal. The princess is quite pretty, but the prince, who is about thirty-five years old, is very sickly-looking, and by no means evinces any ability. The Eighty-seventh Infantry, Lieutenant-Colonel Stevenson, entertained the party at dinner. This regiment was on the eve of sailing for Halifax.

The governor has a very pretty summer palace, called San Antonio, about four miles out from Valetta. The city is built of a light-colored stone, the glare from which in summer must be very disagreeable, contains about 75,000 inhabitants, and has clean, well-paved streets, with sidewalks. The opera-house is small but very pretty, and one evening the governor placed his box at the general's disposal. Drives were taken along the sea-shore to the summer barrack of the troops, but as St. Paul's Bay was some miles west of Valetta, it was not visited. After a week the general and party left for Egypt (Alexandria), in a steamer of the Peninsular and Oriental line, on Monday, March 11. This steamer, the *Ceylon*, was large and comfortable, and had come from Southampton

with about seventy passengers, mostly English officers on their way to India. Among these were Sir Arthur and Lady Kennedy, the former going out as governor to Hong-Kong. Sir Arthur having been Governor of Vancouver's Island in 1865, had passed through the United States, and was quite familiar with them. The passage was a pleasant one, and in three days and six hours after leaving Malta the *Ceylon* anchored in the bay of Alexandria. This was at 6 P.M., and in about half an hour afterward General C. P. Stone, who had been an officer of the regular army in the United States, and who was at that time adjutant-general in the army of the Viceroy of Egypt, came on board, having been sent from Cairo to wait for and receive the general on behalf of the viceroy, and to offer in his name every facility for the perfect enjoyment of his visit. The party, under his guidance, went on shore to the hotel, thus escaping the nuisance of the custom-house. After driving about the town the next morning, to Pompey's Pillar, and being confused by the crowds of veiled women, of donkeys, camels, and many more things seen for the first time, at 3 P.M., by a special train, the party left for Ismailia, on the Suez Canal. Previous to this they made a visit to the docks which are being constructed near Alexandria, and which will cost some $25,000,000. These are being made out of artificial blocks of stone, each of which weighs about twenty tons. Some of them are built up from smaller stones as a solid piece of masonry, while others are made by mixing cement, sand, and small stones. This mixture is emptied into a frame made of boards, easily taken apart. So soon as the cement has hardened the boards are removed, and the block is ready for use.

On General Sherman's return to the hotel after this inspection he found awaiting him several Americans who were in the service of the Khedive, all of whom were glad to see him, and spoke of America in the warmest terms. Among these were Generals Loring and Reynolds, whose names figured among those engaged in the rebellion. At 3 P.M., as before mentioned, the party, accompanied by General Loring, started for the canal. Their route lay through a level but highly cultivated country, in which were many villages, the houses of which were built of mud, one story high, very close together, with alleys for streets, each house having but one room, in which men, women, children, chickens, etc., all live together. Each village has its sheik, or headman, who furnishes all the details called for, such as money, soldiers, working parties, etc. The railroad crossed the two branches of the Nile—the Rosetta and the Damietta—which form the Delta. The route lay through Zagazig and the "Land of Goshen" of the Bible, which looked as though it still flowed with "milk and honey." It seemed strange to hear the puff of the engine and the rattle of a railway train through a coun-

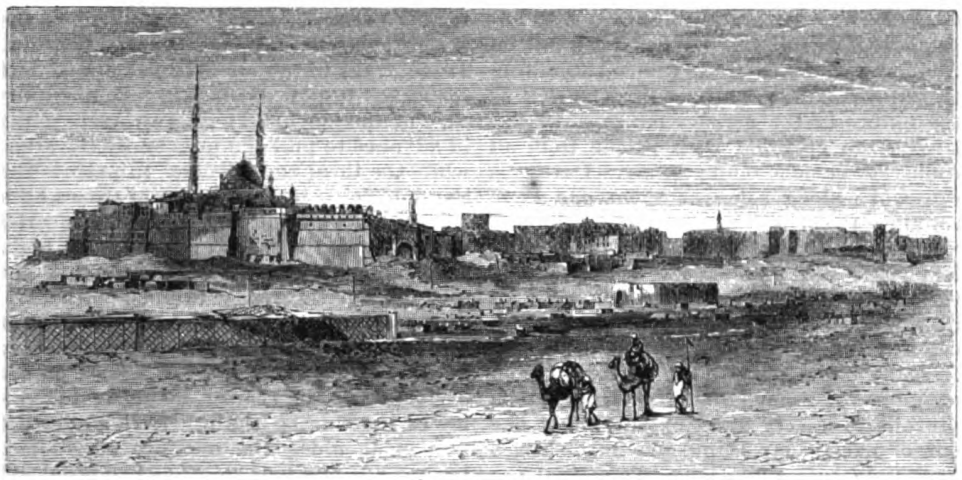
SUEZ CANAL.

try which seems among the things that have long since passed away. About 8 P.M. the desert was reached, and by 9.30 P.M. the party arrived at Ismailia, where there is a fair but very expensive hotel. During the building of the canal Ismailia was a very considerable place, but since its completion it has fallen off in population. Since this visit, however, the Khedive has ordered that the military school should be established there, and no doubt the Ismailiaites thank the fates for this important addition to their town. Early the next morning the party started in a special tug-boat prepared for them. Leaving Ismailia, which is on Lake Timsah—part of the canal—they proceeded to Port Said. The canal is simply an immense ditch, dug from the Mediterranean at Port Said to the Red Sea at Suez, containing about twenty-six feet depth of water, and is about one hundred and fifty feet wide. It runs in its entire length through a desert. Near Ismailia is a fresh-water channel from the Nile, and iron pipes run along the bank of the canal to Port Said, supplying that place with fresh-water. Between Ismailia and Port Said are two or three stations or landings for boats. The distance to Port Said is forty miles, and the town contains about 2000 inhabitants, and looks exactly like any new place in the United States. There is a good breakwater, and a very fine light-house about two hundred feet high, from the top of which an immense extent of sand can be seen. The United States have a consul at Port Said, and a quiet time he must have.



Ismailia was reached on the return at 7 P.M., and during the trip down and back six large vessels were met, the toll for which is ten francs (two dollars) per ton, and ten francs for each passenger. The special train was waiting at Ismailia, and, on the arrival of the party there, continued on to Suez, which place was reached at midnight, the distance being forty-five miles, the railroad running through the desert. There is a respectable hotel at Suez, in which accommo-

dations were obtained. The next morning a special boat was given the general, in which the party proceeded to inspect the improvements there being made. Two large basins were in process of construction, one for the use of men-of-war, the other for merchantmen, the stone for which was obtained from a quarry not far distant. The plan of construction consists in building two walls with a space between, the interval filled with the dredgings from the basin; and when this is once dried by the sun a very good quay is made. Much new land is thus being reclaimed, and at this point the new town of Suez is to be—the old one, which is now a very indifferent place, being about one and a half miles away. Passengers from Europe to India, leaving the steamer at Alexandria, cross by rail to Suez, where they again take steamer. Across the Red Sea from Suez can be seen the clump of trees which mark the bitter wells at which Moses halted. Two days distant by camel is Mount Sinai, and a point of land some distance from Suez is indicated as the place where the Israelites crossed the Red Sea. The sea once extended north beyond Suez, where there is now a small stream containing shallow water. At noon General Sherman left by the same train for Cairo, distant one hundred and fifty miles, the return being made by Zagazig. The desert runs flush up with the fertile land, and the transition from desert to verdure is abrupt. Numerous irrigating ditches cross the country, by the side of which are the paths made by the natives and their camels. By these, as well as at every village, are places for prayer; and it was common to see the Arab stop his camel, resort to one of these places, and, with face turned toward Mecca, perform his devotions. In the evening the party came in sight of the Pyramids, and soon afterward Cairo was reached. The viceroy had directed that accommodations should be taken for the general at the principal hotel, where he was to be located as the viceroy's guest, and an official was at the station to announce this fact. General Sherman, however, declined this honor, and upon the urgent request of General Stone consented to go to his house; and from General Stone and his pleasant wife and daughter the party during their sojourn in Egypt received the kindest hospitality. The day after their arrival the wind blew a perfect gale, and the dust was almost unbearable. It came through every crevice, and showed what Cairo must be during the prevalence of the "kampsen." The same day the viceroy sent word that he would receive the general and party in morning dress at 12 M., at which hour they presented themselves at the palace, where they were received by one of the viceroy's household, and shown into a small waiting-room.

Shortly after this they were directed to proceed up a staircase covered with a handsome Turkey carpet. Some eight or ten steps from the head of the staircase a rather stout gentleman dressed in European costume, but wearing the fez, was encountered. An introduction took place, but not very audible; and after shaking hands with each in turn the ascent was continued, and the party shown into a very pretty room in blue, furnished with chairs and sofas; upon one of the latter General Sherman sat down, the stout gentleman sitting in a chair on his left. It was only then the fact became known that this gentleman was the viceroy. It was the etiquette for him to commence the conversation, which he soon did in French, and chatted away with spirit, relating anecdotes of his life in Paris, at which he laughed very heartily. He is about 43 years old, 5 feet 6 inches high, weighs about 180 pounds, has a pleasant face, and made the most favorable impression upon the party. His grandfather, Mehemet Ali, was but a common fisherman, yet by his military ability made the Sultan of Turkey tremble. The usual questions were asked and replied to about the respective countries of Egypt and the United States, and the viceroy offered the general special trains, steamboats, etc., to facilitate his seeing as much as possible during the fifteen days he expected to remain in the country. All these offers the general declined, but his highness begged he would accept them as a favor to him, which the general then consented to do. The interview lasted about three-quarters of an hour. At the end of this time the viceroy, whose place it was, made the move, and accompanied the party not only to the head of the stairs but to the foot, and nearly to the door, an honor not usually accorded visitors. The interview was like any between gentlemen; no pipes or coffee were offered. The viceroy, having spent five years in France, was thoroughly conversant with European customs. The remainder of the day was devoted to the museum, in which are mummies, statues, sarcophagi, jewelry, etc., one, two, three, and even six thousand years old. Some of the rings and bracelets of gold taken from the tomb of a queen were particularly fine. In another case were combs, both fine and coarse, eggs, seeds, fish-hooks, the same as those now in use, cribbage-boards, a specimen of hair-pins, and many more things curious in their resemblance to articles of the same kind of the present day, and whose state of preservation was remarkable. In the evening, in company with General Mott, an American in the viceroy's army, the party attended the circus. The viceroy placed his box at their disposal, which is large and comfortable, with a retiring-room back. On each side of this is one for his sons. The circus is quite a fine building, very well arranged, and

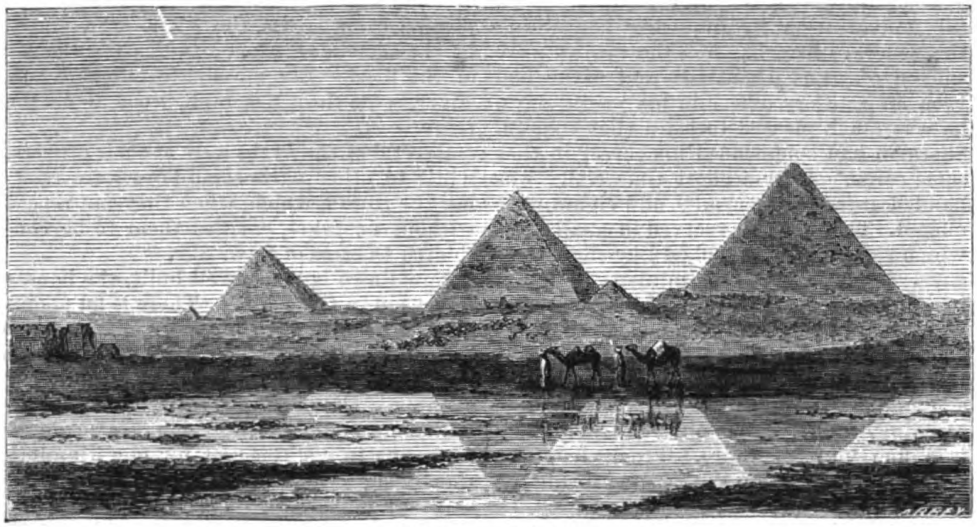
THE CITADEL, CAIRO.

the performance was very good, the riding of the women being particularly so.

The next day, having left cards on the Minister of State, he not being at home, the party made a visit to Cassim Pasha, the Minister of War, who was located in the Citadel, which building was once the viceroy's palace, and in it lived Mehemet Ali. The office of the adjutant-general of the army is now there, as are the various offices pertaining to the War Department. They were ushered into a large room, the size of the East Room of the White House, in Washington, where a tall man, of about sixty-five years of age, with gray hair and beard, met them very cordially, shaking each by the hand, and motioning them to seats. Arranged around the sides of the room were chairs and sofas. This had been the audience-chamber of Mehemet Ali. Cassim Pasha sat at the head of the room, with General Sherman on his right hand. An Egyptian officer acted as interpreter, the Minister of War speaking only Arabic. He commenced the conversation by inquiring concerning the general's health; then the armies were spoken of, guns discussed; and as he had been an artillery officer in his young days, he was much pleased to learn that General Sherman had commenced his career in that same corps. After a short time coffee was handed around by servants, and cigars were offered. The coffee was served in small cups, which rested in what looked like silver egg-cups. Each bowed to the minister in drinking, he having set the example. The interview lasted about half an hour, after which the party were shown over this old palace. Below the winter suit of apartments is a summer suit, and even yet this is a fine old building, from the balcony of which there is a fine view of Cairo. From there the party made a visit to the mosque inside the Citadel walls, before entering which they were obliged to put on coverings of red flannel over their shoes, so as not to defile the temple. Entrance was first had into a large square surrounded by columns of alabaster. The floor was of marble, and in the centre stood a covered fountain, at which the hands, arms to the elbows, legs to the knees, and faces of the Mussulmans are washed before they enter the mosque. This is a very large building, the entire walls of which are of alabaster, and the ceiling is handsomely gilded and painted. A great number of lamps and chandeliers hang about, which are lighted on certain occasions. The floor was covered with Turkey carpets. Sparrows and doves were quite plentiful inside, and kept up a great clatter. The custodian of the mosque is the priest who from a high pulpit, which is reached by a long staircase, explains the Koran. In one corner of the mosque is an inclosed place, in which is the tomb of Mehemet Ali. This tomb is quite high, and is covered with a most exquisitely embroidered cloth. From an upright piece of wood which rises above the tomb are suspended India scarfs, the whole surmounted by the turban, this latter indicating the sex of the dead. Six massive candlesticks of silver, some three feet high, stood about the tomb.

Several of the Arabs were at their prayers, while in other parts some boys were reciting the Koran, which, when they can repeat without mistakes, entitles them to be considered Doctors of Law.



New Cairo is being well built, the houses European in their style. There is an opera-house, circus, theatre, hippodrome, two large hotels, etc.; also a very pretty park, which was once a pond. Here a band plays every evening. Gas jets are arranged for illuminations, the globes to which are made to represent tulips, the cost for one illumination being $4000. The Khedive is making as many improvements as the jealousy of the Sultan will permit. In the old part of

Cairo the streets are very narrow and unpaved. The shops are small, open to the front, and are upon streets divided according to the nationality of the sellers as well as the nature of the articles for sale. These streets are crowded with people from all countries, camels, donkeys, etc. Carriages can move along some of them, and have running ahead a servant, called a "lais," who carries a long staff and clears the way. His loose sleeves puffed out like wings by the wind as he runs, his bare arms and legs, his red fez and embroidered sash, make him one of the most picturesque among the natives. The Arabs are fine, muscular-looking men, but the women are ugly. Ophthalmia prevails to a very great extent, about one out of every four being affected. Not a long time before the general's arrival the last opera of Verdi, named *Aida*, which had been written for the viceroy, and put upon the stage at a cost to his highness of $150,000, had been sung. Learning that General Sherman had expressed a desire to hear this, the viceroy directed one evening that it should be repeated, and placed his box at the general's disposal for that occasion. The costumes were very rich, and the scenery, as well as the plot, entirely Egyptian.

By 8 A.M., on March 20, the party were off on a visit to the Pyramids, about five miles distant. They crossed the Nile by a good bridge, in which there is a draw, and continued along a macadamized road, shaded in most part by acacias, to the bluff of limestone upon which the Pyramids are built, and which, when once reached, are not so imposing as the imagination had pictured. Near by were two villages, from which the natives came rushing to offer their services, but General Stone being along, the sheik kept them in order. To the ordinary traveler these people must be a great nuisance. It was decided to make the ascent of the highest, the Pyramid of Cheops, 460 feet. Three Arabs were detailed to each one, and the ascent began. This was done along the edge of the northeast side, two Arabs going in advance to pull the pilgrim by the arms, while the third came behind to push. The Pyramid being built in layers of stones, each layer diminishing in size, these form a series of steps, some of which are four feet high. The general halted three-quarters of the way up, but the rest continued to the top, where there is a space about fifteen feet square, and from which the view is very extended, over the desert of Sahara on the one side, and the beautifully cultivated valley of the Nile on the other. The descent was made along the opposite edge—not, however, before four shillings had been paid to an importunate native, who promised to descend, and ascend the Pyramid opposite to the one on which the party was, in ten minutes.

The next thing in order was to enter the Pyramid, which is done by a narrow passage. This passage first descends to a place where one must go upon his hands and knees. This passed, it ascends until one finally enters a room about sixteen feet by twelve feet, in which is a sarcophagus. The sides of this room were of very handsomely cut granite. Returning, the party had to submit to be carried by the guides, as the descent was over stones too slippery for shoes. Near the Pyramid is a house which was built by the viceroy upon the visit of Eugénie, when Empress of the French. This was opened for General Sherman by the viceroy's orders, and in it a luncheon was served which had been brought along. After luncheon a visit was made to the Sphinx, which is close to the larger Pyramid, and on the way a tomb some forty feet deep, and

SPHINX AT GHIZEH, NEAR CAIRO.

whose sides were lined with granite, was passed. At the bottom, carved out of a piece of gray granite, was an Egyptian figure which covered the resting-place of the corpse. Near by are some other tombs, which are easily reached by steps of gradual descent. The masonry and polished granite there seen are very fine and interesting. The Sphinx is an Egyptian head, with body something in shape like that of a lion. The nose has been partially effaced during the passage of five thousand years. The head is hollow. The whole ground is a mass of tombs, but as soon as they are uncovered the ever-shifting sand again conceals them. The day was very warm, and the party got back to town well tired out by the day's jaunt. That evening General Mott entertained them at dinner. The next morning the Minister of War returned the visit of a few days before, and sat for an hour and a half. After he had gone an excursion was made to Heliopolis, some six miles from Cairo, where the only thing of interest is an obelisk about seventy feet high covered with Egyptian inscriptions. Some two miles nearer Cairo is a tree under which the Holy Family are said to have rested in their flight into Egypt. During the ex-empress's visit the viceroy presented this tree to her, and she caused a paling fence to be built about it. On the return to town the military school was visited, where some four hundred cadets were engaged in study. The artillery and staff comprise one school, and the cavalry and infantry another each. The cadets are instructed in the Turkish, French, English, and German languages; in geometry, plain and descriptive; signal duty, after the style adopted in the United States; drawing, fencing, etc., in which they were exercised for the benefit of the party, and acquitted themselves very creditably. Much of the system adopted at West Point is being introduced, and the army is conducted and the officers paid the same as in the United States two years ago. There are nineteen Americans in the service, no one of whom has a rank lower than major. The cadets are in uniform, but not well dressed nor well "set up," but through General Stone this is being gradually remedied. The staff's school showed to the best advantage.

On Saturday morning, a special train having been provided, and supplied by the viceroy's orders with cooks, servants, and plenty of edibles, the party started for Upper Egypt, under the guidance of General Stone and Betts Bey, an Englishman in charge of the railroads. During this and other excursions General Sherman and party received from Betts Bey much polite attention. The object of this journey was to see the character of the country, the tombs of Beni-Hassan, and last, but by no means the least, the sugar factories of the Khedive. After passing over about one hundred miles Feschu was reached, where there was quite a large sugar

factory in the course of construction, under the charge of a young Englishman. Scattered about was machinery which had been brought from Philadelphia. This factory not being in operation, the party proceeded, notwithstanding the great heat of the day, to Rhoda, the terminus of the railroad, and one hundred and eighty-one miles from Cairo. Here the factory was in full operation, and the Arabs employed were quite numerous. The sugar-cane lay about in great profusion, and was being handled by the natives, whose ages varied from seven to fifty years. Without entering too much into detail, the process of making the sugar consisted in this: First the cane is passed under immense rollers, which extract all the juice, which passes by troughs into tanks, where it is mixed with a little lime in order to precipitate the foreign matter. After this it is passed through charcoal for purification, then run into a boiler, where it is exposed to sufficient heat to form a sirup. This sirup is again passed through charcoal, and from thence into large boilers, where it is exposed to great heat for six hours, after which, having become thickened in this operation, it is passed into vats, from which it is taken, mixed with some fresh juice, and then placed in tanks, which revolve with great rapidity, the centrifugal force throwing off the sugar, which clings to the sides of the vat, while the molasses is drawn off by a faucet. These factories, of which there are eight along the railroad, are owned by the viceroy, who derives from them a very large income. The sugar is taken to Alexandria and sold at auction, generally bringing seven and one-half cents the pound. They are more extensive than those at Union, in Cuba. The viceroy is having railroads built upon which to bring the cane from the fields. In the evening the party returned to Minieh (one hour from Rhoda), and slept in a part of the viceroy's summer palace at that place, which had been opened for their use. Minieh has its sugar factory also, and is a town of about 7000 inhabitants—the houses very irregular, and built of adobe. To reach the palace from the

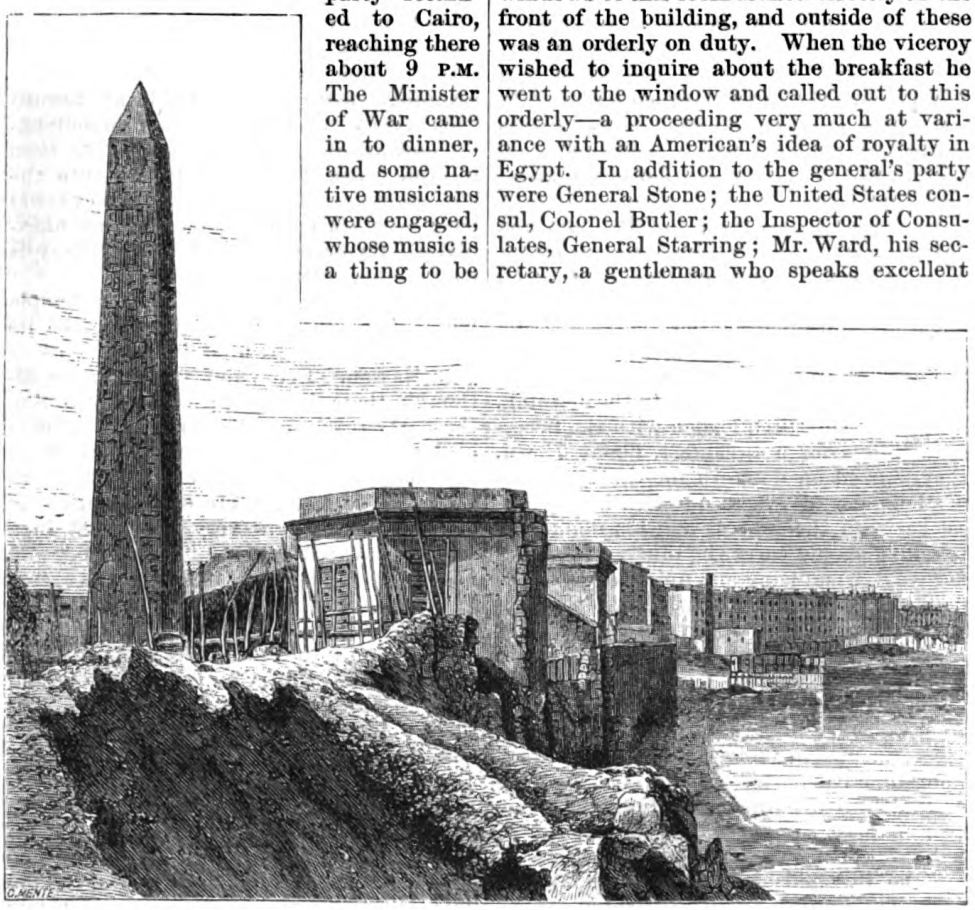
railroad, the party had to ride on donkeys, which are as obstinate in Egypt as any where else. A small but pretty steamboat belonging to the viceroy had been sent in accordance with his orders from Cairo, and having taken a cargo of donkeys on a barge, the general and party went on board and proceeded up the Nile for about an hour and a half, when a landing was made, as one would make it on the Mississippi, by tying up to the bank. The donkeys were landed from the boat, the party mounted, and in a mile from the shore came to a bluff, up the side of which an ascent was partly made, and the tombs of the ancient Egyptians, known as those of Beni-Hassan, were reached, which are more easily designated by the name of rooms cut out of the side-hills of lime rock. Some of them have been very beautiful, containing columns, and the walls are even now covered with paintings of athletic sports, birds, fishes, donkeys, oxen, geese, boats, deer, and gods, all very well executed—the colors still bright, although they are supposed to be four thousand years old. In the floors of these rooms are deep wells into which the remains were lowered, and the places hollowed out in the sides of these wells showed how the ancient sexton descended to his work. After wandering about for an hour or more in wonder at the civilization of so many thousand years before, the party returned to the dirty and dusty village of Minieh, and at 8 P.M. started for Sakkara, sixteen miles out from Cairo, and the railway station of old Memphis.

To approach the haunts of Pharaoh and Joseph in a railway car was indeed a novelty. Sakkara was reached at 2.30 A.M., and upon donkeys the party reached the Nile, about one and a half miles, where they found another steamboat, which had been sent by the viceroy's orders, to furnish shelter for the remainder of the night. In the morning, a camel having been loaded with the necessary things for a breakfast, about 7 A.M. they started on donkeys for the Pyramids of Memphis. It was a question at the outset between the general and his donkey as to which should carry the other. Once under way, the mincing and quick steps of the donkeys gave rise to many curious mathematical curves, and to several of the party it was a question as to how long they would remain mounted.

Shortly after starting grooms arrived from Cairo having in charge horses from the viceroy's own private stables, and upon a fine animal imported from France the general mounted. Among the number were two or three Arabians. The distance from Sakkara to the edge of the desert on which are the Pyramids is six miles, the horse-path running through cultivated fields. Where Memphis once stood is now a small, dirty village of mud houses, and one can easily believe that the original place was not much better. Probably history three thousand years from that day will ennoble the dirty sheik of the village as he was seen on that hot and dusty morning. Reaching the Pyramids, bones and skulls lying around, and the occasional glimpse of the corner of a tomb appearing through the sand, showed where the dead had been buried. Rising an acclivity of perhaps fifty feet, the desert is reached, and who knows but that the skull the horse's hoof has just caused to ring may not have once belonged to a Pharaoh? The Pyramids are not so imposing nor nearly so large as those of Ghizeh, near Cairo. The most interesting things to be seen, however, are the tombs of the "Sacred Bulls." Near these a rude shelter of boards has been raised, and leaving the servants to prepare the breakfast, into these tombs the party descended. One of the Egyptian gods was a bull, which was worshiped in the flesh of other bulls chosen on account of some peculiar marks, and these animals as they died were buried with pomp in these tombs. Going down some easy steps, one enters a gallery from which at right angles run other galleries. At intervals on the right and left of these are recesses, in which are immense hollow blocks of granite, with heavy lids, in which these dead bulls were placed standing. Some of these tombs are beautifully carved with birds and other hieroglyphics, and all of them have long since been robbed. How they were gotten into the gallery, and when once there how they could have been placed in the recesses, are unexplained mysteries. The largest gallery is nearly one-quarter of a mile long.



Not far from these tombs is a temple which, though small, has the sides of its wall beautifully painted in figures, as at Beni-Hassan. Red paint predominates, although there is some green. By 5 P.M. the party reached Cairo, tired out and covered with dust. The country up as far as they had gone differs little from that about Cairo. The villages are of mud brick, or adobe, the villagers very poor, clad in a single loose garment of "blue jean," and nearly all, both little and big, have sore eyes, many having lost one. Palm-trees are the only ones to be seen. The Nile is a fair companion for the Mississippi; its banks are high, and the country on both sides flat and uninteresting. Cairo is an exception, for there the Arabian Nights are reproduced, and the water-carrier and the lamp-seller are the same as in the days of Aladdin.

The day after the party returned from up the Nile, the viceroy having placed a steamboat at their disposal, they started for the "Barage," which is at the division of the Nile. Formerly the country suffered below this point by reason of the river being too

low to force the water into the irrigating canals. For this purpose the "Barage" was built, and is really a bridge with many handsome towers, very Moorish in its appearance, and with many piers close together. At one end of the bridge is a lock, like in a canal, through which the vessels pass up or down. Between each two of the piers is an iron apron, which is worked from the bridge, and is raised or lowered on a circle, and by means of these the water is kept at a certain height. The length of the bridge, which is used by foot passengers, is 500 yards. It was completed by Mehemet Ali's orders in 1849. Before that the country below yielded one crop the year; now two are obtained. About two miles below Cairo the steamer got fast on a sand-bar, and remained there for six hours, notwithstanding the pushing and shouting of some twenty naked natives, who were engaged from the shore. General Stone telegraphed to Cairo. The viceroy was just crossing the Nile to his palace of Ghizeh, and hearing of General Sherman's trouble, sent his own particular steamboat to his assistance. At the "Barage" is an artillery camp, but it was too late to look at the guns; so, after partaking of coffee, the party returned to Cairo, reaching there about 9 P.M. The Minister of War came in to dinner, and some native musicians were engaged, whose music is a thing to be avoided. The instruments were in shape like guitars, tambourines, and a species of harp resting flat on the lap. One had simply a reed for a flute, and this he played without a mouth-piece. They accompanied their music with howling, which they called singing, and altogether the noise was dreadful.

One day during the visit of General Sherman in Cairo he and his party were invited by the viceroy to breakfast at his palace of Ahassieh, some four miles out of town, where he was then staying. The hour for breakfast was fixed at 12 M., at which time the party presented themselves at the appointed place, and were shown quietly from the hall into a room on the left-hand side, where they were received by the viceroy. He was dressed in plain citizen's clothes, as were also General Sherman and party, according to instructions received. The viceroy was even more affable than on the first interview. Upon the table in the centre of the room were some photographs of his sugar factories, and some specimens of sugar in bottles, to which he laughingly referred, remarking that his table looked more like that of a sugar merchant than a viceroy's. The windows of this room looked directly on the front of the building, and outside of these was an orderly on duty. When the viceroy wished to inquire about the breakfast he went to the window and called out to this orderly—a proceeding very much at variance with an American's idea of royalty in Egypt. In addition to the general's party were General Stone; the United States consul, Colonel Butler; the Inspector of Consulates, General Starring; Mr. Ward, his secretary, a gentleman who speaks excellent

French; and two of the viceroy's household. After some twenty minutes' conversation the breakfast was announced, and the party passed to an adjoining room, where the table was ready. This room and the one first entered were about thirty feet by thirty-five, without much furniture, but still very pretty, as the walls, ceilings, and such furniture as was there were covered with chintz. The table was handsomely arranged in European style. The viceroy sat in the centre; opposite him General Sherman—the seat of honor; on the right and left of the viceroy, in order, were General Starring and Colonel Butler; on the right and left of General Sherman were Colonel Audenried and General Stone; Mr. Grant sat on Colonel Butler's left—the whole being arranged according to rank, the members of the viceroy's household sitting at the end of the table. The servants were four in number, and the cut of their coats was exactly that of an Episcopal clergyman, which is the undress uniform of all employés of the viceroy. They also wore white gloves and the customary red fez. During the breakfast, which lasted over an hour, the conversation was lively, the general's remarks being quickly and nicely turned into French by Mr. Ward. The bill of fare, which was served in courses, consisted of soup; macaroni, nicely cooked with cheese; fillet de bœuf, larded with truffles; partridges, with mushrooms (salmis); turkey, roasted, and stuffed with truffles; green pease; asparagus. The dessert consisted of a species of blanc-mange, vanilla ice-cream, strawberries, fruit, and coffee. These were served in the order mentioned, the general being served at the same time with the viceroy. The wines were Sauterne, Medoc, and Champagne. After breakfast some time was passed in the reception-room, and at 3 P.M. the party took their final leave of the viceroy, who expressed the sincere pleasure his meeting with General Sherman gave him. As the party left the palace, Mr. Lesseps, of Suez Canal notoriety, came in. He is a handsome man, with gray hair and rather dark mustache, and about fifty-five years of age. With his wife, who is about twenty-four years old, and quite pretty, he had been spending some time in Cairo.

The remaining few days were passed in going about Cairo. There is in the suburbs a very pretty drive called the Schoubrah, which is about three or four miles long, and has on each side some handsome houses, European in their style. A fine row of acacias grows on each side the drive, and in many cases the tops mingle together, forming quite pretty arbors. Along this road in the afternoon the people, both native and foreign, drive, and the carriages, with the curtains generally drawn down, and with the attendant eunuch on the box, are objects of much curiosity to the stranger. These carriages draw off on the side roads, and the occupants descend for a little exercise, closely guarded by the eunuchs. Wandering along the street one day, a procession was met consisting of several carriages full of veiled women, the leading one being covered with an India shawl. The whole was preceded by a brass band discoursing most wretched music. Upon inquiry, this was ascertained to be a wedding.

Friday being the Mussulman Sunday, the party went to see the dancing dervishes, to do which they had to drive to the old part of Cairo, and found there a frame building in shape something like a church. This was quite full of Arabs and some Europeans, through which a passage was made, and a kind of bench secured, upon which the party stood. Around the inside of the building ran a gallery, one portion of which was inclosed by lattice-work, behind which the native ladies sat. A railing inclosed the centre of the room, and inside this, seated upon the floor, were about half a dozen priests, who wore high conical hats, and long coats gathered at the waist by a sash. Around the other sides of the inclosure were some thirty Arabs. The exercise had already commenced, and these Arabs were throwing their heads over the right and left shoulders alternately, keeping time, and bringing their breath out at each movement with a puff. The time was marked by the thumping upon a tambourine, and also by the beating upon what looked like a cocoa-nut shell covered with skin. In the front of these were two men who, with arms held out straight from the body, kept up a continual turning around without moving from their places. After a short time this set of performers gave place to another, many of whom had very long hair. Before commencing they gave to one of the priests their gowns and turbans, which were placed by the priests, who were seated. A priest who was quite an old man took his place in front of the performers, and by keeping time with his hands set the party in motion, and a general bowing of the heads commenced. This was encouraged by a kind of chant, and the motion gradually extended from the head to the body, until finally they all bent nearly to the floor, and then throwing themselves backward, with the head turned upward, gave vent to a puff, the long hair of those who wore it covering and uncovering the face in each movement. One of the worshipers chanted something which seemed to have the effect of greatly exciting the dervishes, who continued to increase their movement until it became very rapid, and the foam began issuing from the mouths of several. A man, and a boy of about twelve, each of whom wore a conical-shaped hat of felt and a gown which was kept inflated by the motion, were

spinning around during this time, their heads thrown to one side, one arm raised with the elbow bent, the other held straight out from the body. They seemed to turn with great ease and rapidity for twenty minutes, walking off at the end of that time without any apparent ill effect. The most excited of all these was a negro, black as night, who finally became so deranged as to throw himself on his hands and knees, and violently beat his head on the floor, while some others fell down and stiffened themselves, each one being taken care of by the priests, who restrained them from injuring themselves. It must have been hot work, for the perspiration ran from the faces of the spectators.

On Saturday, March 30, the party left Cairo for Alexandria. Quite a heavy rain had fallen during the night, so that the road was free from dust. The general and party remained in Alexandria until the following Tuesday, during which time the United States consul-general gave a dinner. The other days were passed in driving about and visiting such places as had been overlooked during the first days of their arrival, among them Cleopatra's Needle. On Tuesday the party took passage on the Austrian Lloyd's steamer *Minerva*. Going on board the steamer at 4 P.M., the captain immediately caused the American flag to be hoisted at the foremast as a token of respect to the general, and this he did at every port the steamer afterward entered on its voyage to Constantinople. As the *Minerva* steamed out of the harbor the familiar strains of *Yankee Doodle* were heard from the deck of a Russian man-of-war, recently arrived. These gradually died away in the distance, and by the time darkness settled down the *Minerva* was well away to sea.

WAS IT A FAILURE?

"Died, in this city, on the 17th inst., MARGARET, only daughter of the late ANTHONY B. MORRISSON, aged 42."

"POOR Margaret!" I said, as I laid down the newspaper I had been reading. "And *that* is the end of it all! What a wasted life! what a total failure her whole existence has been! Power without scope; talent without opportunity; affections without an object; life without an interest; death without regret! Poor, poor Margaret!

"And yet," I said, as I resumed my sewing, while the obituary I had just been reading filled my mind, "what right have I to term her life a failure, and her existence wasted? I am looking at it from a wholly earthly stand-point. I see, indeed, no garnered fruits; but may it not be that in the eyes of the higher intelligences she has come home bringing with her the ripened sheaves of a celestial harvest? She was pure and good, patient, self-denying, and uncomplaining: can it be that these virtues have borne no fruitage, and will the great 'Lord of the Harvest' count her day as wasted, her life a failure?"

Poor Margaret! There are some persons who seem to enjoy the happy gift of never growing old; and there are others, less enviable, who seem never to have been young. Of this latter and less-favored class was Margaret Morrisson. It would seem as if she must have been *born* mature, sensible, and reticent. One can imagine her, lying in her very cradle, wakeful, observant, silent, and reflective; but no force of imagination could picture her as ever being one of those sweet, laughing-eyed, dimpling, open-mouthed, bewitching babies, whose loving nurses can toss them up in the air, and shake out of them at any time a gurgling stream of baby-laughter, as soft as a chime of silver bells, as sweet and merry as the song of a bobolink in early summer.

Still, this view of Margaret's babyhood we must own to be altogether imaginative and theoretic. It is tracing the stream backward, and is like the way of the modern naturalists, who, given a chance-preserved old bone or tooth, will straightway declare to you what was the whole nature and construction of the living and possibly antediluvian animal.

We lay claim to no such scientific acumen, and must avow that our own personal knowledge of Margaret did not begin until she was about twelve or thirteen years old, at which time she was a shy, prim, sallow girl, tall, angular, awkward, and slightly stooping; rarely speaking unless it was unavoidable, and when she did speak, oppressed with shy, nervous hesitancy.

Margaret was an only daughter—indeed, an only child; but these magical words, which in most cases seem to imply in the very outset the idea of unlimited parental love, and an amount of indulgence which is oftentimes a real injury, meant only in her case that she stood alone in the world, without brother or sister to love and be beloved by; and this sad heritage of loneliness was all the distinction her heiress-ship had ever brought her.

To her parents Margaret had never been an object of tenderness. They were selfish people, who had not even that better and half-redeeming modification of selfishness which sees *itself* reflected in an only child, and gratifies *itself* in its indulgence of another.

The Morrissons did not love children, and Margaret's birth had given them no pleasure. She was only an incumbrance, her existence a necessary evil, which they were bound to endure and maintain. Possibly, had any sudden illness threatened the life of their child, it might have called up in them some-

thing of parental affection; but Margaret, though never robust, was a healthy child, and gave her parents no such chance of testing their affection for her.

Mr. and Mrs. Morrisson had married early in life. Mrs. Morrisson had before marriage been a small belle and small heiress, and these pretensions she still held at something beyond their par value; partly, perhaps, because they (at least the latter qualification) had won for her the hand of her husband, then a young, handsome, and rather popular man. But alas for the vanity of vanities! her small fortune had been half dissipated by Mr. Morrisson's well-meant but injudicious speculations, and Time—that adroit thief of *personal* property—had robbed her of nearly all her early charms.

Vexed and dissatisfied, without mental resources, indolent and self-indulgent, she had gradually sunk into a state of confirmed invalidism. She was not exactly one of those much-afflicted women who, as the satirist tells us,

> "With sad tears the weary doctor tease
> To name the nameless, ever-new disease;"

but she had a better system: she had a set of complaisant diseases, all her own, that came at her call as obediently as a flock of pigeons; she had, in fact, "brought them all up, and made them what they were," as the saying is; and she could tell them off upon her fingers, and give you their dates and other statistics about them—indeed, she liked to do it. For instance, in the early springtime she *always* had a slow, nervous fever (a very slow one), and a cough which she constantly averred would one day terminate in consumption; but it never did. This usually held on until May, when she was subject to what she termed her "spring feelings"—that was, weakness, nervous prostration, and great depression of spirits. This was always succeeded by a bilious attack. At midsummer the rose-cold made a martyr of her, and later in the autumn it would settle into her old catarrhal and bronchial difficulties. Oh, she knew well enough what she had to expect, to the very day! Then in winter came the rheumatism, neuralgia, and sciatica, which carried her round to the slow, nervous fever period again; and these, with chilblains, agues, a good deal of tooth and ear ache, sick headaches, and an *always* weak back, did seem (had they not half of them been purely imaginary) rather a full cup of trembling to be drank year after year!

It seemed almost incredible, come to think of it, that a beneficent Providence *should* have sent such a host of tribulations upon one weak little woman! And no doubt she thought so; but she never said *just exactly that*, though her manner implied it, and doubtless gave herself no little credit for her forbearance with Providence in the matter. It was just so much to be set down on her side of the account.

Sickness is apt to be selfish, even in the best and most generous natures; and a woman so singled out as a mark for suffering could not be supposed or expected to be a very loving mother. And Margaret, having never known a mother's tenderness, certainly did not expect it, however her young heart yearned for it.

With her father it was still worse. His home was any thing but a pleasant place to him, for his wife was always too ill to receive company at home or to go out, and had little conversation beyond a querulous recapitulation of her various woes and sufferings, past, present, and to come. He was a business man now, and he spent his time, or professed to spend it, all except mealtimes, at his office. He had never made Margaret's acquaintance, so to speak; for the ailing wife always claimed and received the little attention he had to bestow, and the shy, timid girl never ventured to address him. And so, beyond offering her a piece more meat at table, or telling her to sit up straight, he rarely spoke to her. Oh, how Margaret wished he would! She was not so weary of *him* as she was of her mother, with her constant self-condolences; for they rarely met; and if he would only once speak to her as other fathers did to other girls, if he would once just call her "Maggie dear," or say "My daughter," it seemed as if she would have thrown her arms about his neck, and sobbed out that she was the very happiest girl in the world!

But this would not have made him the happiest father in the world by any means, and Margaret was intuitively aware of it; and not for the universe would she have ventured upon the slightest demonstration of the tenderness which filled her heart for him. Her nurse had been a Quakeress, a staid, good woman and a faithful nurse; but in her religious sect there is ever inculcated a sort of stoicism which represses enthusiasm, and holds all emotion under a strong restraint; and possibly the morbid repression and quietude which so strongly marked Margaret's maturer character might be referred to Lydia's early training.

Margaret, when old enough, had been sent to school. *All* children go to school, do they not? But no inquiry was ever made as to her progress there, no interest shown as to her proficiency.

Once or twice, when she had seen other girls gladly displaying their birthday or Christmas presents, it had fallen coldly upon Margaret's heart that her birthdays were never thus remembered, her Christmas-days never thus made happy; and then thinking, poor innocent child, that perhaps her tastes were unknown to her parents, she had ventured to speak of these gifts before them,

and with an artless artfulness that made her heart beat and her very voice tremble, she had intimated how much *she* should delight in such a book or such a singing-bird. Poor child! she might have spared herself the pain of the innocent artifice, for no one but herself seemed to notice it.

Then it flashed across her mind that her parents had no reason to be proud of her. If she could win honors at school, and bear home testimonials of her success, might they not warm up to her and say one kind, approving word? She would try.

Margaret was not a student by nature or choice, but she had good talents and perseverance, and she was determined to win success: she gave her whole mind to it; she studied early and late; *and she won.* It was a large class, and the highest, and the competition was severe; but one day she came home triumphant, with her usually pale cheeks flushing almost painfully. With shy, downcast eyes and wildly beating heart she made the grand announcement — she stood at the top of the highest class!

"I supposed you were there long ago," said her father, coldly. He said no more, and Margaret's zeal for learning was quenched forever.

At length, when other girls of Margaret's age were leaving school, she too was removed. Possibly until then neither of her parents had remarked that the tall, shy, ungraceful child had grown into a well-developed young lady. And so she left school, and sat at home and did the family sewing, or waited in her mother's darkened room, drawing the window-shades up and down, beating up the cushions, and shifting the pillows and moving the footstool; or, sent down into the kitchen, compounding some dainty dish coveted by the exacting invalid, who, though she never owned to having an appetite, certainly did contrive to "worry down," as she called it, a very fair amount of nourishing food in the course of the twenty-four hours.

But Margaret was now of an age to be introduced into society, and of course she felt all a young girl's anxiety to see something of the gayeties of the world; but who was to introduce her? Her mother (unlike the unselfish matrons who still wearily frequent the ball-room, when their own enjoyment there has passed away, to keep their places in society for their growing daughters) had ceased to go out into company or entertain guests at home, when her own fading charms made the ball-room no longer an excitement to her; and now you might as well have asked "Peter the Hermit" as to have invited her.

Of course Mr. Morrisson did not go without her; at least not to ladies' parties. If he solaced himself by a whist-club or a supper-party upon those nights when he had "so much business at the office, my dear, I may be out late," that is no affair of ours; if he was *making* money or *spending* it upon those not infrequent seasons of great business pressure, who knows? Certainly not Margaret or her mother. And so there was really no hereditary place in society kept open for poor Margaret; she heard of balls and parties all around her, but she seemed to stand afar off—shut out, by no fault of her own, from the innocent pleasures of her age and station; and she felt it, as any young girl would.

At last a former friend of Mrs. Morrisson's, or rather one of the old set she once belonged to, in giving a grand general party, a brilliant ball, possibly from good nature, or more probably to swell the boasted list of invited guests, sent cards to Mr. and Mrs. Morrisson, and, remembering to have heard they had a grown-up daughter, included Miss Morrisson in the invitation.

Margaret was surprised and delighted; she knew—for it had been long talked of—that it was to be the great event of fashionable life, the crowning ball of the season. And as she turned the polished card, with its silvery lettering and graceful monogram, over and over in her trembling hands, she felt as if she held the talisman which could open to her the halls of enchantment.

"Why, Margaret," said her mother, querulously, "do you want to go?"

"Oh, mother! yes, indeed; but *can I?*" And the girl looked up in wonder and delight.

"I suppose you can if you want to. Can't she, father?"

"I suppose so," said Mr. Morrisson, carelessly, just glancing up from the paper he was reading; and neither parent said any thing more.

Margaret went up to her own chamber in a state of pleasurable mental bewilderment; for a few brief moments her thoughts soared away,

> "As light of heart, as gay of wing,
> As Eden's garden bird."

Then slowly, slowly and reluctantly, they came back to the actual, present life. She had been dwelling upon the *possible,* and now she had to turn and face the *impossible.*

And first, how was she to go? She had no one to introduce her, and she had never in her life been to a party. She felt sure her father would not even take her there, and come for her. They did not keep a man-servant, and to ask to have a carriage sent for her sole use, as other girls did, seemed to her humble, self-denying nature an extravagance too absurd to be contemplated for a moment.

But this was only the beginning of her troubles. Her dress—ah! *that* was the worst of all. Dress had been from her very childhood one of Margaret's bitterest trials. Her mother, owing to her state of chronic invalidism, or, rather, from the constitutional indo-

lence of character in which most of her myriad ailments had their source and nourishment, had long ago relinquished dress as an amusement, and wore only invalid wraps, sacques, and shawls; and having thus no longer any personal interest in the subject, had become totally unobservant of fashion, and was wholly regardless of the gradual changes which time had brought about. The requirements of her own girlhood, the dresses in which she had made her own petty but well-remembered and much exaggerated triumphs, were still fresh in her mind as models for her daughter; and Margaret, who had a simple but really refined taste in dress, had ever found it one of her heaviest crosses to wear the badly made and old-fashioned dresses which her mother chose for her, while she knew that for half of the money she could have dressed with the good taste and propriety of a lady.

A love of dress, of pretty and becoming attire, is as natural to the heart of a young girl as is color to the flower or verdure to the leaf; and, when kept within due bounds, may doubtless be as innocent in the eye of Him who gives the butterfly its painted wings as is the bloom of the rose or the stainless whiteness of the lily; and Margaret had remonstrated quietly again and again, but it was unavailing. Mrs. Morrisson could not or would not see (how could she in her sick-room?) the change which had gone on around her. And at length Margaret, with her morbid and too sensitive ideas of duty, had resigned herself to the affliction, and felt, with bitterness of spirit but outward calmness, that, while shrinking with shy diffidence from all observation, she was made far more conspicuous from her total disregard to the ruling fashions than if she had been the very gayest butterfly of the mode.

These trials may seem little to older persons, but only a young girl so thwarted can estimate the bitterness of the mortification; and now, in view of this coming ball, what was she to do? She knew that she had not one single article of suitable ball costume; she knew herself but very little of the many requirements of fashion; but she *did* know too well her own utter want of outfit. To be sure, she could ask her father for the money, and he was not a mean man. His expenditure of money was always liberal, and she felt sure, if she could summon up courage to ask him for money, he would not hesitate to give whatever she might ask him for; but how should she get courage to ask him? She never had. And then it would all have to be expended under the direction of her mother, and Margaret well knew that she would regard crinoline, trains, double skirts, low neck and bare arms, French gloves and flowers, and (most important to her, and worst of all in her mother's eyes) hair dressed by a fashionable artist, as a direct revival of Babylonish wickedness. Margaret's sad prophetic spirit saw a fortnight of painful disputation, and dire defeat at the end of it. Was it really worth while for her own selfish pleasure to make the effort? Did not duty (ah, poor Margaret's morbid sense of duty!) require her to give it up? And yet she *did* so want to go!

Two days she balanced this question in her own mind with subtle arguments, pro et con, and with some secret tears, for it *was* a trial for a girl of eighteen; and on the third day she wrote a note, declining for herself and her parents.

Mrs. Olney's splendid ball took place; it was the great event of the fashionable season. Every body went, and Margaret sat at the window of her mother's darkened room and watched, with closely clasped hands and sternly shut lips, the rolling carriages which bore other and more favored girls to the unknown pleasures which her imagination pictured and exaggerated.

There was one pleasant family living in the same street with the Morrissons, one of whose young daughters had attended school with Margaret. They had been in the same class, shared the same desk, and walked to and from school together; and this girl, Adeline Norton, a fine, bright, sweet-tempered girl, was the one person in the whole world whom Margaret best knew, and with whom she felt most at ease.

She told Margaret of the splendors and delights of the Olney ball, which she had attended, and lamented that Margaret, who owned to having been invited, had not gone too; and Margaret, who was too shy and reticent to explain *why* she did not go, expressed her own regret.

"Well," said Addie, as they parted at her father's door, "we are going to have a little party at our house next week—oh, nothing, you know, in the least like the Olneys' ball; but just a little simple sociable—all young people. Just a little simple affair, in honor of my brother's vacation; and you must come over then. I shall not let you off; so now, remember, you are engaged, and I will give you timely notice." And Margaret smiled and thanked her, and did not say if she would come or not.

Early in the next week Addie came to ask her for Thursday. "I have not given out any other invitations yet," she said; "but I wanted to make sure of you." The fact was, that the kind-hearted, considerate girl wanted to give her friend time to prepare a dress.

Margaret made some demur about going, but Addie would take no denial. She fairly overruled all her objections—she could come over early, and Harry would see her home. And at last Margaret promised, if "nothing happened," and her mother was as well as usual, and did not object, she would come.

"Only a little sociable," she repeated to

herself, and the words seemed to give her courage. If she was ever to go, she could not have a better time to begin. Only just across the street—and Addie was so kind, and she knew her so well, and it was only a little sociable!

To be sure, her dress was just the same; *that* difficulty remained; but then it was not to be a ball, like Mrs. Olney's, "and, of course," she thought, with a sigh of relief, "people won't wear full dress at a little sociable, and so it is not so much matter."

She propounded the matter to her mother, who did not object, only saying, with a fretful, exasperating sneer, "If you don't back out of it, as you did before."

From that time until Thursday came Margaret thought of little else; she rehearsed in her own mind all the little she knew about parties and party manners, and grew hot or cold as the anticipated pleasures and difficulties rose before her.

She dressed early, that she might put up her hair better by daylight. Never did she take so much pains with it, and never had it "acted so bad," as the girlish term is. Possibly the fingers that trembled so with excitement that she could scarcely hold her pins had something to do with that. Then she put on her best dress, and was ready. And still it wanted hours of the time to go.

Then she went into her mother's room to give her her tea, and settle her for the night; and when that was over Mrs. Morrisson could not understand why Margaret did not go. "It is not time yet, mother," said Margaret, gently; but the question and answer were repeated until Mrs. Morrisson grew angry. "I don't see why you *don't* go, Margaret."

"People don't go so early, mamma."

"Then I'd set them a better example." As if poor shy, meek Margaret was a person to lead society, and set herself against a fashion!

At last, when the peevish invalid had said two or three times, "Well, of all the absurdities I ever knew! I hope you'll get there in time to come home with the rest of them!" Margaret's patience could hold out no longer. Fairly driven out of the house, she wrapped herself up in her thick shawl, and ran unattended down the street, half frightened at her own temerity.

She saw with a glance that the drawing-rooms were not lighted; but it had been arranged between the friends that Margaret was to go up into Addie's room and go down with her, thus avoiding the dreaded entrance into a room full of company. So, slipping by the bowing and exquisite darky at the door, Margaret followed the female servant who came to receive her up the lighted staircase to Addie's room.

As the door was flung open for her, oh, what a bower of beauty it seemed, with its pretty white and gold furniture and snowy muslin draperies, warm, brilliantly lighted, and redolent of perfume! Addie turned from the glass as the servant relieved Margaret of her heavy shawl, and taking her hand kindly, stooped and kissed her cheek. Addie!—*was it really Addie*, or some celestial visitant? Margaret gazed at the pink and white vision before her in wondering admiration. She had never before seen any one dressed for a party, and the pretty, smiling young girl, in her full floating robes of snowy white lace or muslin, ruffled to the waist, and dotted here and there with exquisite little rose-buds; with streaming sash of marvelous colors; with her soft hair puffed and braided and curled, and adorned with ribbons and flowers; with bare neck and arms, their whiteness heightened by costly jewelry—seemed to Margaret's inexperienced eyes a very marvel of loveliness!

"Oh, Addie!" she exclaimed, warmly returning her friend's kiss, "you do look just like an angel fresh from paradise!"

"Do I, dear?" said Addie, laughing gayly. "Now if some of our beaux had only said that!"

The two young girls had met and greeted in the middle of the room, accidentally pausing just in front of the long swinging glass at which Addie had dressed; and now, as Margaret turned, her quick eye caught the reflection of them both, side by side. What a contrast! Addie in her festive robes like shining mist, with laughing eyes and glowing cheeks, and sweet lips breaking into rosy smiles; and herself, in a dark, sad-colored silk, rich and heavy, but every way unsuited to the occasion; made straight and plain, high neck and long sleeves; no train, no hoops, no flowers, no over-skirt or sash—nothing to relieve the figure; a little, prim, embroidered collar, and her only ornaments a very small, old-fashioned pearl pin and ear-rings, which her mother had worn in her girlhood; with pale sallow cheeks, sad heavy eyes, and plainly braided hair.

And yet, although she did not know it, Margaret had really greater capabilities of beauty than her companion. Dress her in a pretty, becoming costume, suitable to her age, to the occasion, and to the fashion; take from her, by a little judicious praise and allowable flattery, that shrinking self-consciousness which made her really beautiful figure stiff and awkward; break up those heavy braids of lustrous black hair into a more modern style of coiffure; let those expressive dark eyes, now hidden under their long, thick, silken lashes, light up and flash with mirth and intellect and merriment; bid that sallow but smooth cheek redden with exercise and excitement, and the full lips part over the faultless teeth in sunny smiles of youthful anticipation of enjoyment, such as was felt by the little fairy thing at her

side—and Margaret would have far outshone her little butterfly friend.

But she did not see this. She saw only the wide present contrast; and with a smothered cry of anguish she hid her face in her hands, and tears of intense mortification trickled through her fingers.

"Margaret! dear Margaret! oh, what is it?" asked her half-comprehending friend. "Dear Margaret! don't do so; you frighten me."

But by this time Margaret's habitual self-control had come to the rescue.

"Look there," she said, pointing to the glass as she wiped away the unwonted tears, "and see if you wonder. I do not think it is envy, dear," she said, meekly—"oh, I hope it is not; but, dear Addie, let me go home. I see that my dress is not fit; I *thought*— But let me go home before any one else sees me; before I disgrace you."

"You shall do no such thing," said Addie, warmly. "Disgrace, indeed! Why, your dress is a far more costly one than mine, if we come to that. It is a very rich silk, only it *is* rather heavy for a party. Why did not you put on one of your thin evening dresses, dear?"

"I have not got any such," said Margaret. "But I see now how unfit mine is. Please let me go."

"What! go home? no, indeed!" said the sympathizing Addie. "Stop, Margaret; I'll tell you what we will do. We are very nearly of a size: you shall have one of my dresses. Oh, it will be such fun! I have got a white tarlatan with three skirts, trimmed with corn-color; just the thing for you; and you must have one of my hoops; and Mary shall dress your hair. There is plenty of time, and it will be splendid!"

"Stop a moment, dear Addie. I can not wear your dress."

"Why not? Oh yes, you can. It would just fit you; I am sure it would."

"Yes, dear, I dare say; but I think mamma would not like it."

"Why not?"

"Oh, I don't know; only—only mamma is very particular about my dress."

"So is my mother. She would not let me wear any thing that was not proper and nice; and what is proper and fit for *me* must be proper for *you*. Come, say you will, that's a good girl. I'm dying to see how nice you will look."

For one moment Margaret's resolution wavered; the temptation was a great one. Then her strong sense of duty told her, if her mother did not allow her such dresses, it would be disobedience to wear such a one surreptitiously, and she firmly but thankfully refused.

At this moment Mrs. Norton entered the chamber to inspect her daughter's toilet, and the warm-hearted and impulsive girl told her the case, and appealed to her to influence Margaret. But Mrs. Norton saw the whole situation at a glance. "I think your friend is quite right, my dear Addie," she said, "and I respect her for her loyalty to her mother's wishes. I do not advise her to wear your dress, but I think, without changing her own, we can make it more suitable for an evening party; and your mother would not object to that, my dear Miss Morrisson. Ring for Mary to dress Margaret's hair a little more, Addie, and then bring me your pretty white muslin basque."

In a few moments, under Mrs. Norton's careful supervision, Margaret's really beautiful hair was arranged in a more modern and becoming fashion, and a brilliant pomegranate flower pinned among its burnished tresses; the meek little collar was removed, and the close high dress loosened at the throat, and turned away a little; and then with Addie's embroidered sacque, with its rich lace trimmings and loose drapery sleeves, slipped on over the rich dead-leaf silk, and secured by tasteful knots of pomegranate-colored ribbon, our heroine did really look like another being.

"There! *now* look in the glass again, and see what mamma can do," said the delighted Adeline, leading her up to the mirror. "There! *now* how do you look?"

"I don't know how I *look*," said the blushing girl, scarcely daring to glance at her own altered reflection, "but I know how I *feel*. I am very, very grateful." This was the most of a speech Margaret had ever made in her life, and it cost her a mighty effort; but it had the merit of being sincere, which is more than can be said of most complimentary speeches.

"Oh, here come our bouquets, Margaret! just in time," said Addie. "I ordered one for you, dear, just like mine, for I knew you would not remember it. And—stop one moment—you had better take one of my handkerchiefs, they are smaller than yours;" and she produced a tiny thing, all lace and embroidery. "Stop, let me fasten it for you; and now—oh, your fan! there is a fan goes with that dress. See here, Margaret; just the color of your bows. Why, I declare you do look lovely! doesn't she, mamma?"

"See here, my dear Margaret," said Mrs. Norton, kindly, "here is a lighter-colored pair of gloves than yours; I want you to accept them from me in token of my approbation of your respect to your mother's wishes."

"And for setting such a good example to your own madcap girl," said Adeline, fondly kissing her mother's cheek. "And now, dear Margaret, if you please, we will go down stairs, for

"'The hour is nigh, O County Guy!'"

she sang as she ran merrily down stairs.

To Margaret's surprise she found the

drawing-room carpets up, and musicians already there, and in a few moments the brilliantly lighted rooms were filled with youth and beauty. And oh, such dresses! Even Addie's, which had seemed so overwhelming to her, was plain and simple in comparison to those of some of her guests. "Only a little sociable!" repeated Margaret to herself, and her ideas of sociability were enlarged wonderfully.

Then the dancing began, and Margaret, overwhelmed and bewildered by the music, the din of voices, the shifting forms, and general brilliancy of the scene, withdrew into a sheltered corner, and feeling "among them, yet not of them," she became a looker-on, "and *saw*, not *shared*, the pleasures of the ball." Yet she was content, though she knew no one, amused by the novelty of the scene, and interested in watching her vivacious little friend, who hovered about like a humming-bird among the guests. And whenever Addie found time to run up and speak a few kind words to her, and point out the distinguished belles, she assured her she was very well entertained by merely looking on. But Addie, whose successes as a belle were very different, could not realize this, and after introducing two or three "nice girls," who did not seem to care to remain in Margaret's corner, she brought up a pleasant-looking young man, introduced him, and passed on.

Oh, how Margaret wished she would have left her alone! for the young gentleman stood by her side a few moments, and made a few commonplace remarks, to which the shy, timid girl was conscious of returning inane answers, and then asked her for the next dance! This was a thunder-clap to Margaret; such a danger had never crossed her mind; she had never learned to dance, and even if she had, she was too humble to expect any one to ask *her*. She was too ignorant of the conventionalities of society to know even in what form of words to decline. She could not tell him, a stranger, that she had never been to dancing-school, so she blushed, and hesitated, and stammered out she hoped he would excuse her; and the young man, who had only asked her to dance at the instigation of their pretty little hostess, and who, of course, could not dream of the real state of the case, thinking she meant a rudeness, drew himself up proudly, made her a haughty bow, and walked away, mortified and indignant, leaving Margaret ready to sink with shame at feeling she had been uncivil, and possibly had affronted one of Addie's guests.

Then the gorgeous fan and bouquet which Addie had put into her hands were wonderfully in her way. She had never been taught to play with a fan, to wield it as a weapon of attack or defense, like the pretty flirting trifles before her; and though she loved flowers dearly, it seemed out of keeping and unnatural for *her* to stand holding up a great bunch of them all the evening like a plaster of Paris flower-girl. Yet, in her love for Adeline, she would not put them down, although she felt they rather increased than lessened her awkwardness.

But a new trouble was at hand, to which all that had gone before was as nothing. She heard a loud, ringing voice request the gentlemen to take their partners down to supper. She saw them, arm in arm, gliding gracefully out of the room, and—oh! what was to become of *her*? She had no partner; she knew nobody; what should she do? Must she stay there and see them all go off, and leave her alone there with only the black fiddlers? Oh, the shame of it! oh, the bitter sense of loneliness, the exaggerated sense of shame! Not that she cared for the supper. Oh, if she could only have got quietly home, she would have agreed not to eat again for a week, for a month, for a year! But just as the tears of mortification were ready to drop, just as she was wishing the floor would open and let her through (which would not have mended the matter at all, as the supper-room was just beneath), relief came. Her watchful little friend had foreseen this very difficulty, and had arranged to meet it.

She had first applied to Harry; but that obliging brother, with the graceful suavity and good-breeding which a collegiate life does sometimes succeed in bestowing, had replied, with charming frankness:

"No, I'll be hanged if I do! You are too hard upon a fellow, Addie. I *said* I'd trot her home, and I'll stand to *that;* but I'm going to take Bessie Tyler down to supper, and I am not the man to prance down stairs, steamboat fashion, with a woman hanging on each arm, and making a guy of myself, I tell you."

But a few hasty words whispered in the ear of her father had succeeded better. His love for his own children had taught him to sympathize with other young persons, and he agreed to see that Miss Morrisson was not neglected. And just as the mortified girl was doubting if she should *cry*, or *fly*, or *die*, the kind, genial "gentleman of the old school" came up and blandly offered his arm to take her down to supper; and never poor drowning wretch, dragged out of the whelming surf by a great noble Newfoundland dog, was more truly grateful to his preserver.

Mr. Norton took her down to supper, found her a quiet standing-place, relieved her of her fan and flowers, heaped her plate with the best upon the table, and then, helping himself, he stood by her and talked. At first poor shy Margaret trembled so she could scarcely lift her spoon to her lips; but gradually, reassured by her companion's fatherly manner (oh! so much more fatherly than her own father's had ever been!), she

became able to give coherent and rational answers. Then he insisted upon her taking part of a glass of wine; and warmed and emboldened by the unusual stimulus, Margaret became able to raise her bright, beautiful eyes timidly to his, and answer his merry sallies in a strain of almost corresponding playfulness, at the remembrance of which she often wondered afterward.

"I will tell you what, Miss Margaret," said the amused listener, pleased with his success, "I think you and I get on so well, we ought to try a dance together; what do you say to *that?*"

Then Margaret told him of her ignorance of dancing, and of the rudeness she feared she had been guilty of, and he laughed heartily.

"Never mind, my dear," he said, *sotto voce*. "Between you and me, a little *snubbing* won't hurt any of those young gentlemen, I fancy. And so you won't dance with me? Well, maybe it is just as well, for I fancy our accomplishments in that line are about upon an equality. You have never learned to dance, and I have forgotten how; so we will postpone our dance for another opportunity. In the mean time, let us both practice our steps diligently, and I shall claim you for my partner at the next ball we meet at: now remember." And Margaret gave the promise, though she felt he would never find her at another party.

Then he took her up stairs again, and, finding her a seat at a table covered with books and engravings, stood by her and turned them over, and led her to talk about them; and though he incidentally discovered that his companion had never been out of her native place, never before at a party, never at a lecture, play, or concert, he found she was conversant with books and history, and capable, when at ease, of very ready and intelligent conversation. He remained with her some time, and Margaret always looked upon that conversation with a man old enough to be her father as the one pleasure of the evening.

After he left her, time went slowly, and when she saw the first guests making their adieux, bent upon escaping the attendance of the dreaded collegian, she slipped quietly out of the room, ran up to Addie's chamber, stripped off her borrowed feathers, retaining only the gloves and flowers, wrapped herself up in her thick shawl, glided down stairs and out of the door, and threading her way among a crowd of drivers and lookers-on, darted, swift as another Cinderella, down the street to her home.

The hall lamp was out, so she knew her parents were not waiting her return, and she was glad of that. Taking a light from the woman who let her in, she ran up stairs, gained her own room, locked the door, and, flinging herself face downward upon the bed, gave way to the passionate tears of a young heart's bitter disappointment.

After a while she grew calmer; but when she reviewed the evening, she felt in her deepest consciousness that she was not made for society; that she could neither find nor give pleasure in going into company. She felt deeply grateful for all that the Nortons had done for her; no one else would ever be so kind and thoughtful for her again; and if, with all that, the evening had been a failure, why, then— And again the quick tears broke forth.

At length, controlling herself by a strong effort, Margaret rose, took off her dress, put her bouquet into water, bathed her face and hands, and having whispered her devotions in a humble, self-accusing spirit, went to bed, but not to sleep. Still the dance music throbbed upon her ears; still the flashing lights and iris-colored dresses moved before her closed eyes; and it was morning before she sank into her troubled sleep. Of course she was late the next day, and she was not sorry to find her father had gone out, and her mother had one of her nervous headaches: it saved all questioning then, and the subject was too unimportant to them to be remembered afterward.

Margaret never attempted another party; she felt, as her old Quaker nurse used to say, that she "had no leadings to try it again;" but she retained the friendship of the Norton family, and used to step in there sometimes when they were quite alone of an evening; and now and then, not often, she went with them to some lecture or concert.

But the rolling years were bringing a change; Mrs. Morrisson was taken very alarmingly ill. Hitherto her ailments had been of a very mild type, and wholly under her own control and management; but now

> "The ill which came not at her call
> Would not depart at her command."

And it was singular to see how, at the touch of real sickness, valetudinarianism disappeared. When the true king comes to the throne, the pretenders shrink away; and, writhing under attacks of severe pain, Mrs. Morrisson forgot her nerves and her bile. And stranger still to see how, subdued and chastened by real suffering, she, who had been querulous and exacting in fancied ailments, became patient and forbearing. For the first time in her life she felt and expressed sympathy for Margaret's weary feet and her tireless watchings; thanked her gratefully for the little tender ministrations she had never seemed to notice before; pressed the hand of the wondering girl lovingly, lingeringly, and even drew her down to her pillow to kiss her; so that when she died (for, of course, this was death's doings), Margaret wept with a newly developed tenderness, and felt she had lost, what she had

never before known she had, a mother's love. And how was it about Mr. Morrisson? It would seem *natural* that at the touch of a common sorrow the two sole survivors of the family should be drawn together, and mingle their tears. It did seem *natural* that the bereaved husband, seeing his only child weeping for her mother, should open his arms to her (oh, how Margaret wished he would!), and be at once consoler and consoled; but that was not his way.

He was an exemplary mourner, a model widower! He "walked in all the ordinances of the law blameless;" his arrangements for the mourning and the funeral were faultless; his bearing and behavior at the cemetery in perfect good taste. On the Sunday following he sat to be preached to and prayed at with his face decently concealed, according to rule, in a white handkerchief and a black glove, and walked home with solemn pace by Margaret's side; and the next morning the curtain fell, he went back to his office, and all was over.

But Margaret had now a new mission, and she entered upon it fully. She felt as if her father's comfort was henceforth to be her charge—a duty devolved upon her by her mother's death. She had a natural turn for housekeeping, and, thrown upon her own resources, it developed rapidly. Neatness, method, and regularity had been part of her early Quaker training, and they availed her now. She made herself acquainted with every detail of the family arrangements, to spare her father. He was fond of good eating, and she studied his tastes, and fed him like an alderman. His meals were punctual to the moment, and Margaret always ready and attentive. She kept close watch over his wardrobe. He never found a missing button, a neglected stocking, or a faulty collar. The house was the perfection of neatness; the rooms warm, bright, and cozy in winter, and cool, shady, and fragrant with flowers in summer.

Mr. Morrisson did not express gratification or approval: *that* Margaret did not expect. But he found no fault (he could not), and her humble heart was content with that. Judge, then, her feelings when, in less than two years after her mother's death, he coolly, and without any preparation, announced to her his intention of a speedy second marriage!

Margaret was struck dumb. Such an event had never crossed her mind. Parents seem older to their children than to others; and Mr. Morrisson was nearly sixty, and to Margaret that seemed a very advanced age, and his marriage ridiculous. Then her mother had been dead so short a time. Oh, the absurdity it was in her father! the insult it was to her dead mother! But, controlling herself with difficulty, she inquired *who* the lady was. And the rush of blood went tingling down to her finger-ends when her father named a gay young widow, whose flippant conduct, both before and since the recent death of her husband, had drawn upon her comments which, true or false, a woman's reputation is too fragile to bear. And before she had time to rally from this second blow he informed her that Mrs. Tracy was coming the next day to see the house, and decide what alterations and repairs it would need; and this without even the poor common courtesy of waiting for Margaret to call upon her, thus virtually setting her aside, and ignoring her very existence as the present mistress of her father's house.

The poor girl could not speak, she only bowed in silence; and then her father left her, and she fled to the secrecy of her own room, and hiding her face in her trembling hands, tried to think calmly of what she had heard.

"Not *yet two years*, and *to such a woman!*" she sobbed out, for she was thinking first of her mother. Those two last weeks of her illness had produced a revulsion in Margaret's feelings: death softens all asperities. And looking back through the mist of tears, and in the light which streams from the grave, Margaret had taught herself to feel, in humble self-accusation, that *she* had been the one to blame for their long estrangement. If she had been more caressing, her mother might have been more demonstrative. And then she was *always such a sufferer!* For the *sham* ailments, which Margaret had known to be *shams* at the time, she now looked back upon with pitying tenderness, and had gradually built up for her mother a character for virtues which she had never recognized in her in life, and which (it is to be hoped that Mrs. M. does not hear us) she was not in the least entitled to.

And all this time Margaret had never once thought of the result of this marriage upon herself. She was too unselfish. *That* was to be forced upon her later.

The next day Mr. Morrisson and the dashing little widow drove up. He introduced her, and Margaret tried to be polite; but the visitor saw through the transparent disguise, and made up her mind they were to be enemies.

Then they went over the house. They did not ask Margaret to go with them, but she heard their voices in earnest debate in the different rooms. Then they came back, and her father asked her for cake and wine, and she had to listen with a heavy heart to her father's antiquated gallantries, and to the widow's giggling, flippant replies and coquetries. Then they drove off without a word to Margaret.

The next day Mr. Morrisson informed his daughter that Mrs. Tracy would want the room next to his for a nursery for her little boy.

Margaret looked up inquiringly. "You do not mean *my* chamber, father?"

"I mean the nursery chamber, of course."

"Father," said Margaret, rising and standing before him, pale, cold, and rigid, "do I understand you?—do you mean that I am to give up *my* chamber to that child?"

"Of course I do: my wife will want her child near her. There are other chambers quite as good, and I do not know that one room in my house belongs to you more than any other. And I wish the room vacated at once, as it will need painting and papering."

There was nothing more to be said. And the next day Margaret removed to one of the upper rooms, but it did not seem a home to her. She had never before slept a night out of the room she had had to give up, and she felt in exile away from it.

But this was little to what was to come. The patient sweetness and gentle dignity with which Margaret had yielded up her mother's keys, and resigned her honors as mistress of the house, would have appealed to the generosity of a better nature than her successor possessed. But it did not touch her. And if she had had a divining-rod by which to test the most vulnerable points in Margaret's nature, she could not have aimed her blows more skillfully. Her victim was orderly, and had those strong local attachments which some people seem born without; she was habited, and her quiet, lonely life had tended to confirm all these peculiarities. It annoyed her to see the furniture out of its accustomed places; it was a real trial to her to see the windows and blinds of "the best chamber" flung open, and sun and dust streaming in upon the verdant freshness of the carpet in that sacred room! Again and again she said to herself, "It did not signify." *But it did,* to her.

It tried her orderly spirit to see the best dinner-set taken into general use, and "gold-banded white" and "blue Canton" china indiscriminately mixed together upon the table, and to have the nice white dinner napkins she had kept white as snow used at dessert, and stained with fruit and coffee; she could not help starting when little Eddie climbed up and danced on the drawing-room couches, cracked nuts on the front stairs, or ate candy and gingerbread lying upon the parlor carpet.

Eddie was a pretty little merry fellow, although willful and spoiled by indulgence, and Margaret had never been used to children; but her nature was truly womanly, and no true woman can live in the house with a bright, healthy, happy-hearted child and remain unmoved by its witchery; and her heart warmed to the pretty boy, who looked at her half-shyly, half-coaxingly, through his long dancing curls. She longed to be friends with him; but once as he tripped in running by her, she said, as she picked him up, "Stop, won't you, Eddie, and give me a kiss?"

"Edward," said the mother, in cold, sneering tones of irony, "you had better go to Miss Morrisson and let her kiss you, if she will be so condescending!" And Margaret asked no more kisses.

The new Mrs. Morrisson was no housekeeper, and every thing fell into disorder; yet if the servants came to Margaret for orders, her interference was resented. Gradually the lines were drawn closer about her, till she felt herself looked upon as a spy and a suspected person. She had no liberty left her; if she asked to have any thing done for her, it made trouble, and the very flowers she had herself cultivated in the garden were no longer hers to break. At last, worn out by this constant checking and fault-finding, Margaret found courage to appeal to her father: she gave him a very slight sketch of her annoyances, and then asked him,

"Father, what can I do?"

"Don't make a fuss about trifles," was the laconic and unsatisfactory reply.

"But they are not trifles, father," pleaded the daughter; "they make me wretched. What *can* I do?"

"Margaret," said Mr. Morrisson, "I can not have my time taken up with these perpetual complaints" (it was the first time Margaret had spoken): "if you can not live happily with my wife, I know of but three courses you can take."

"Three? name them, father, if you please," said Margaret, firmly, for she felt something must be settled, or she should be trampled to the earth. "What is the first?"

"Give up to your step-mother; she is my wife, and the mistress of the family: give up to her."

"I have tried *that* thoroughly; it has done no good. *The next?*"

"Fight it out with her, I suppose; only don't draw me in."

"That," said Margaret, with dignity, "I can never try."

"Then, if you will neither *surrender* nor *fight*, I suppose you *must run.*"

"I do not think I understand you, Sir," said Margaret, growing very pale.

"Don't you? I should think you might. If you can't be happy here, you had better leave. There! is *that* plain enough for you?"

"Do you mean, father," said Margaret, with a temerity she herself wondered at, and, rising, she faced him with eyes beneath which his sank—"do you mean you wish me to leave your house?"

"I have no wish about it," said her father, resuming his paper; "you must suit yourself. If you can not live pleasantly here with my wife, I suppose you would rather leave. You are of age, and you have your

mother's property; it is not large, but ample for your support, I conclude."

Her mother's fortune! This was the first intimation she had ever had of being independent, and the assurance was, indeed, welcome intelligence. She waited for no farther dismissal, but by the help of the Nortons she secured good rooms at the best boarding-house in town, and quietly informing her father where she was going, she collected together all she could strictly call her own (and that was wonderfully little), and removed to her new home.

There, if alone, she was not more so than she had always been, and at least she was at peace, and mistress of her own actions. For a while she heard from the servants, who came to see her, sad stories of the reckless waste and disorder of her father's house; then, as one by one the servants left, she heard no more. She never went there; she saw her father at his office whenever it was necessary to see him. She asked no questions, but, month by month, she saw that he looked more worn and old.

Dr. Norton, a younger brother of Addie's father, boarded at the same house as Margaret. He was an unmarried man, many years older than she was, and had been her mother's physician, and he remembered the patient sweetness and untiring activity she had shown in the sick-room of the nervous invalid; and with him and Addie she now often frequented places of public amusement, from which she had hitherto been debarred, and gradually her life seemed growing less shy and lonely.

The attentions of Dr. Norton were friendly, and his companionship agreeable; and, all unsuspected to herself, a new feeling of tenderness for him was growing up in her heart, when she heard of the sudden death of her step-mother; and a day or two after the funeral Dr. Norton, who was still the medical attendant of the family, brought her a letter from her father. It was brief and cold (but that was the man's nature), and it asked her to return and keep house for him. And then Dr. Norton, who, knowing Margaret's shy nature, had been slowly feeling his way into her favor, startled and alarmed, spoke out and offered himself to her.

Ah! too late, too late! Poor foolish man, did he not know "delays were dangerous?" The opportunity was lost. Had he spoken only one month sooner, she would undoubtedly have given him her promise; and once given, nothing would have induced her to recall it; and she loved him (even more than she herself knew), for he was her first and only lover! But now her father, old, feeble, and lonely, was a too successful rival; her old, morbid sense of duty and self-sacrifice came to the surface again. She realized that she was no longer young; that in turning away from the strong arm that offered itself as a prop for her declining years, and from the loving heart that proffered her a life-long shelter from the world's cold and loneliness, she was turning away from her only chance of domestic happiness. But she did it, and, stifling the new-born hopes within her heart, she went back to the father who had cast her off; for he was old and sad and lonely, and she his only child.

Mr. Morrisson welcomed her back with more of warmth than she expected; but when she saw the desolation and discomfort in his home, the daughter did not wonder, for he loved his material comforts, and these were wofully lacking.

So Margaret took her own old room again, got back some of the old servants, and gradually began the work of reformation and restoration; not in a hurried, ostentatious manner—nothing to worry the feeble master of the house—but, day by day, the old furniture, repaired or newly burnished, slipped back into its accustomed place again. Again the spare chamber was cleaned and set in prim array, and its sacred precincts darkened to a "dim, religious light." Again her mother's picture, reclaimed from the attic, was restored to its old place on the wall. Again the table took on its wonted neatness and good order, and well-planned, relishing dishes took the place of coarse profusion and reckless extravagance; gradually the neglected garden regained its flowery beauty and the door-yard its marvelous neatness; and gradually Mr. Morrisson's brow grew less perplexed, and his step less sad and feeble. And this was possibly the happiest period of Margaret's whole life, for she was like the Jews when they repaired the breaches in the wall of Jerusalem, and restored the old waste places.

Eddie, the little curly-headed boy of other days, was still one of the household, giving to it the needed element of youth and life and merriment. He was now a fine, light-hearted young fellow, and not having his mother's absurd jealousy to hold him back, made warm friends with Margaret; he called her "sister" now, and Margaret, who never had a brother, liked to hear him call her so, and encouraged it; and as he was wholly dependent upon his step-father, Margaret, whose income, now that she lived at home, was beyond her personal needs, had it in her power to show him many substantial kindnesses. She it was that enabled him to take riding lessons, to join the boat-club, to study French, to join the dancing parties held in the public hall; and the limited pocket-money her father allowed him was usually doubled by her; and he in return worked with her in the garden, escorted her to places of amusement, and drove her out to ride, when she paid the stable bills.

At the end of two years Dr. Norton came to tell her of his engagement, and Margaret,

stifling an involuntary feeling of regret, shook hands with him kindly, and cordially congratulated him. Six months after, while the doctor's recent marriage was still the topic of conversation, Margaret's invalid father died suddenly of paralysis; and now Margaret was free, and again *it was too late.* And as the doctor, who was still the family physician, showed her every brotherly kindness, taking upon himself all the dreary arrangements which a son should have done, what wonder if in poor lonely Margaret's heart there rose the desolate refrain,

"Of all the sad words of tongue and pen,
The saddest are these—*it might have been!*"

And now there was nobody left to her but Eddie. Mr. Morrisson's will had left to his step-son only a small pittance; all the rest came to Margaret, who, with characteristic generosity, immediately doubled Edward's portion, and then, quietly making her own will, named him as her sole heir.

And still they lived on together as brother and sister in the old homestead, and the lonely hearted woman made a pet of the stranger beneath her roof, consulting his tastes, indulging his wishes, and fondly trusting in his brotherly attachment. Then she accidentally heard of his marked attentions to a young girl who was very pretty—and *nothing more.*

Margaret did not believe it. Was she not in his confidence? would he not have at least told her—she who had been his best friend through years—of this most important event in his whole life? She waited for his confidence, but it did not come, and she at last playfully questioned him upon the subject.

To her surprise he faltered and hesitated, and then suddenly surprised her with the intelligence that he was already engaged to the girl.

"Why Edward!" she said, reproachfully, for she was deeply wounded by his want of confidence in her, "this is a most imprudent step. What do you intend to do?"

"To do, sister?" said Edward, drawing himself up. "Why, marry her, of course."

"Oh yes, I did not mean to doubt that," said Margaret, sadly smiling at the boy's weak assumption of dignity: "I meant how can you support a wife? What have you to live upon?"

"Well, really," replied Eddie, with calm composure, "I had not quite got to that. I supposed we could all—" He hesitated; Margaret had made him feel himself so much at home with her that he had virtually forgotten that his rights were not equal to her own—that he had *no* right there except in her kindness and courtesy.

"I supposed, dear Margaret— Could we not all live here together?"

"No," said Margaret, decidedly, "that can not be. I tried it once with your mother: I will never try it again."

"Yes, Margaret," remonstrated Edward; "but this would be different."

"Yes," said Margaret, bitterly—for the young man's cool assurance vexed her—"yes, Edward, I mean it *shall* be *very* different."

"But, sister, you are unjust, you are prejudiced; you do not know Fanny."

"Whose fault has *that* been, Edward? No, I do not know her, but I have heard of her."

"*What* have you heard?" said Edward, flushing up hotly.

"*Nothing*, in the way you mean," said Margaret, calmly. "I have heard that she is a pretty face, and *nothing more;* as unfitted to be your wife, Edward, as you are unfit to be her husband."

"By George! Margaret, this is too much," said Edward, rising in sudden anger, "and I will not bear it! You have no right to speak to me so: you are not my sister."

"I know it," said Margaret; "I am not."

"No," continued the young man, passionately, "we are not kin; there's no relationship; we call each other brother and sister, but there is no real tie between us."

"Not the slightest," said Margaret, bitterly.

"I mean," said Edward, cooling down a little, "that we are in reality nothing to each other."

"Nothing at all to each other!" repeated Margaret; and it was as if the lips of a corpse had unclosed and spoken, so hollow and metallic, so dreary and dirge-like, was the voice in which she spake. "And you have only to choose between us."

"Yes, and I choose the woman I love—the woman who loves me!" said Edward, with all a boy's reckless impetuosity.

"Very well," said Margaret; and as she lifted her eyes to his, it seemed to him like looking into the eyes of the dead, so dull and leaden, so unseeing and absent, was their gaze; and the boy's heart smote him.

"Margaret! sister!" he said, visibly softening.

"No, no!" said Margaret, writhing away from him, and holding up her cold, trembling hands as if to repel him; "not sister; *never again;* there is no relationship—we are not of kin—there is no tie between us—we *are nothing to each other!*"

And so they parted. Margaret made no moan, no complaint; but this last blow from the hand of the boy she loved struck home. To him who so coolly cast her off she had devoted herself for years with all the watchful tenderness of a loving mother, all the indulgent beneficence of an older sister, and she "was *nothing to him.*" Quietly, without ostentation, she made a new will, and in the place of "Edward Tracy," she substituted the words, "My true friend and valued physician, James Norton," for she knew now that

he was the only being on earth that had ever truly loved her.

She had no actual disease, and day by day she went on in the dull, lonely round of her daily duties, but day by day the slow step grew slower, and the feeble pulse more feeble still, for she had nothing more to live for. And when the slow step faltered—and *stopped*—when "the whole head grew sick, and the whole heart faint," *then* calmly she "laid her down to sleep, and prayed the Lord her soul to keep." Poor Margaret! she was lonely in her life, and lonely in death; and even from the world unknown no sweet, familiar spirit stretched out loving arms to welcome her. But will it be *ever* so? Will not He whose attribute it is that "He setteth the solitary in families" comfort her, "even as one whom his mother comforteth?" Was that pure, patient, uncomplaining life of generous self-sacrifice and devotion to others a waste of existence? *Was it a failure?*

RECOLLECTIONS OF AN OLD STAGER.

Notices of conspicuous Public Men, with characteristic Anecdotes illustrating their Peculiarities.—Accounts of Congressional and other Duels, and personal Collisions in Congress, including a Glance at Washington Public Life during several Administrations.

EXTEMPORANEOUS EFFORTS.

A DESIRE to be thought superior to the necessity of laborious preparation when about to make an elaborate effort, to be considered able to trust safely to the inspiration of the occasion, has always been a besetting weakness in many of our public men. The affectation of pretending to be equal to any emergency, and of needing no study or research in discussing important questions, so common among our distinguished orators and statesmen, argues a curious misconception of the popular judgment on the subject. The people are naturally incredulous in respect to the creative power of their representatives, and then they are indifferent to great bursts of genius. It is something which they do not comprehend, being rather inclined, as a general thing, to adopt Dr. Johnson's saying, that genius was nothing but persistent effort well directed. An elaborate and well-written essay impresses the popular mind more than a brilliant extemporaneous display. The number of those who have the privilege of hearing the eloquence of our public men is so small in proportion to the readers thereof that the fame of spoken efforts is as nothing when compared with the reputation created by published speeches. Perhaps the highest intellectual enjoyment is derived from listening to an extemporaneous debate, springing up unexpectedly in the course of current legislation. These exhibitions take place more rarely every year. A third of a century ago they were of frequent occurrence in both wings of the Capitol. Lately deliberate and prepared efforts have mainly superseded the old-fashioned debates. It was very different in the old time. Scarcely an important bill came before either House upon which there was not an off-hand, rattling debate, which commanded the undivided attention of the body, as well as of the large auditory generally present. A majority of the Senators were so well instructed upon all topics that came under discussion, and generally so well equipped, that they needed no special preparation on any subject. And the most profound and complicated question was thoroughly expounded and illustrated in the course of a free-and-easy discussion, colloquial and familiar in tone, yet most instructive and satisfactory. On these occasions Senators almost always spoke to the question, and rarely for display; and the amount of information on the points under consideration and of general knowledge contributed on these occasions challenged the admiration of every hearer. Of course much was expected from the chief ornaments of the Senate—Messrs. Clay, Calhoun, and Webster being so designated by general consent, and they were usually listened to with more marked attention than any of their contemporaries; but such men as Wright, Benton, Crittenden, Rives, Evans, Clayton, Choate, Phelps, and many others of less note, rarely failed to speak with much force and effect. Mr. Crittenden was one of the most effective and popular debaters in the Senate. He rarely made a set speech, and never opened the debate, unless it was upon a bill reported from a committee of which he was chairman. But he was always happy in retort or reply; and he often triumphed in a controversial discussion, even when engaged with an antagonist of a more potent intellectual structure and superior culture. He was ready, dextrous, fertile in resources, and always thoroughly self-possessed. He delighted in arguments that were mixed up with mild and courteous personalities, and never objected to retorts in kind. In contests of this description he was never overmatched, and rarely met his equal. He never was known to forego an opportunity for a tilt with an antagonist of ability and character. He often had encounters with Mr. Buchanan, a man of considerable strength in an argument, and whose long experience in public affairs had qualified him to contend, frequently with credit to himself, with the most distinguished men in the Senate. He was not a dextrous or versatile man, and Crittenden always got the better of him in their skirmishes in public debate as well as in private conversation. On one occasion Mr. Buchanan had undertaken to uphold a scheme of Mr. Van Buren's administration to control the Florida Indians by means of a

local military force, which was called "sedentary militia." Mr. Crittenden, who always saw the ludicrous side of every question, threw such a flood of ridicule upon the project, and upon Mr. Buchanan as its advocate, that the latter shrank from the encounter, and the plan of the administration went by the board.

At a party where a large portion of Congress and a sprinkling of citizens were present, given by the "Mess at Kennedy's," a Senatorial cotillion was formed, late in the evening, when fun and frolic were rife. It was made up of Senators, at the instance of Colonel Sevier, of Arkansas, and consisted, on the part of the gentlemen, of Messrs. Buchanan, Crittenden, Sevier, and Barrow of Louisiana. Crittenden and Buchanan stood opposite to each other, and the contrast between the lithe, alert activity of the supple Kentuckian and the ponderous, elephantine clumsiness of the gigantic Pennsylvanian was very striking. In the movement termed "forward and back" Mr. Buchanan cautiously projected one foot a short distance, and leaned his body forward in a singularly ungraceful manner, evidently having no aptitude for the amusement. "Hurry up, Buck!" said Mr. Crittenden. "What the mischief is the matter with you? I'm sorry for your partner. Clearly your left leg has never been to dancing-school."

But I am digressing. The topic which I wished to consider was the proclivity of prominent men to claim that their most brilliant productions were the result not of study, research, and laborious preparation, but of spontaneous, extemporaneous effort—the inspiration of genius—indicating a degree of creative power such as hardly ever pertains to human intellect. Marshall of Kentucky, one of the most brilliant orators of his time, and a man of large scholarly attainments, who had as much of that mystical quality called genius as any of his contemporaries in Congress, was full of affectation in this regard. He spoke readily without preparation, his ideas following each other consecutively and with uncommon force; but he never trusted to the inspiration of the moment when there was opportunity for studying up the subject and arranging his thoughts in advance. He had a habit of absenting himself from the Capitol for days at a time, every hour of which he devoted to reading and study, his acquaintances generally supposing him to be engaged in a debauch. After getting thoroughly crammed and armed at every point, he would come into the House looking exhausted and haggard, giving color to the notion that he had been on a frolic, and watching his opportunity, would pour forth the fruits of his study in a strain of off-hand, striking eloquence that hardly ever failed to astonish his hearers. And the remark was often heard, "What a brilliant man! What could he not accomplish if he was industrious and regular in his habits!"

Mr. Preston, for some time Mr. Calhoun's colleague in the Senate, was an accomplished gentleman and a very popular orator. He never spoke without commanding the attention of his hearers, and few men in Congress had a higher reputation for brilliant extemporaneous eloquence. But he never spoke without the most ample and careful preparation. Soon after he retired from Congress he was chosen president of a college in South Carolina. In an address to the students he said he knew of no such thing as genius or natural inspiration. Whatever of reputation he had acquired was by dint of constant, untiring labor. He had trusted to study and hard work solely. He never spoke in Congress or to a popular assemblage without arranging what he had to say, and even premeditating his sentences and the precise collocation of his words. And he assured his hearers that the only road to public distinction lay through the field of study and research.

Mr. Webster was so thoroughly instructed upon all subjects which came under discussion in Congress that he was equal to almost any occasion, and rarely needed any special preparation. And yet he was not above the weakness of concealing his studies, and the sources whence he drew his inspiration. No man better understood the weight and value of language than Mr. Webster, and what he said was always marked by precision and perspicuity; but when coping with a formidable antagonist he omitted no means that promised to aid him in the contest. He was accustomed to speak of the master production of his life, his celebrated reply to Hayne, as a sort of casual effort, made on the spur of the moment, without much previous consideration.

Probably the two men in public life who could most safely trust to their own resources and acquirements, under all circumstances, were Mr. Adams and Mr. Calhoun. The endowments of Mr. Calhoun were of a higher order, and his creative power was superior to that of Mr. Adams; but the "old man eloquent," as he was called, had a memory so tenacious, and his knowledge was so extensive and exact, that he never seemed to need any special preparation. He was the most laborious and methodical man in Congress, and probably in the country. He kept a voluminous diary, in which every event, incident, or circumstance of the day was carefully noted down; and this, with his habits of industry, made him a very doctor in all matters of controversy and argument. It was a knowledge of his complete equipment and his power as an antagonist that prompted the reply of Mr. Clay, when asked when he purposed

to renew the discussion with Mr. Adams on the vexed question of the fisheries of the Mississippi, as connected with the treaty of Ghent. Finding himself getting the worst of the argument, Mr. Clay closed the consideration of the matter, so far as he was concerned, with the remark that he should drop the subject, hoping to renew it at some future period more favorable for calm discussion, when he expected to show that Mr. Adams was altogether in the wrong. Some time afterward a friend asked him when he proposed to reopen the controversy. "Never!" was his emphatic reply. "A man must be a born fool who voluntarily engages in a controversy with Mr. Adams on a question of fact. I doubt whether he was ever mistaken in his life. And then, if he happens to be in doubt about any thing, he has his inevitable diary, in which he has recorded every thing that has occurred since the adoption of the Federal Constitution."

In every thing pertaining to the treaty of Ghent Mr. Adams was unquestionably more accurately informed than any or all of his associates in the negotiation. And the mode in which he obtained this general and minute information is thus described: When the American commissioners, consisting of Messrs. Adams, Gallatin, Bayard, and Clay, with Jonathan Russell, secretary, met for consultation, they locked themselves in an apartment at the hotel for the purpose of preparing a protocol for a treaty. It was resolved that every proposition should be in writing, and the name of the mover should be thereto attached. The secret conclave was continued for three days, during which time the room was inaccessible to outsiders. After the deliberations of the commissioners had resulted in a *projet* for a treaty, the meeting was dissolved. Mr. Adams remarked that there was a little stationery left, which might as well be saved. "Let the Yankee indulge his economical propensities," said Mr. Clay, as he and his colleagues, with the exception of Mr. Adams, passed out of the room. But the paper, etc., was not the object of Mr. Adams. He gathered up the memoranda scattered over the floor, and was thus in possession of an armory of facts against which no man could successfully contend.

The transition is rather abrupt than otherwise, but I do not know how I can more appropriately introduce a scrap sent me by Mr. M'Keon than in this connection. In describing, in a former number, an attack of Mr. Evans, of Maine, upon Mr. Adams, in the House, I incidentally mentioned the name of Mr. John M'Keon, then a member of Congress from this city. That gentleman kindly sends to the publishers the subjoined paragraphs:

After Mr. Evans's philippic against Mr. Adams, the general expectation of the members of the House of Representatives was that Mr. Adams would answer Mr. Evans's attack. Mr. Evans himself expected it, as will be seen by an interview between him and Mr. M'Keon. Months passed on, but nothing was said by Mr. Adams on the subject, and it was evident that Mr. Adams would not attack again. As the session was drawing to a close, M'Keon and Evans were walking up and down the hall of the House of Representatives in the rear of the Speaker's chair, when M'Keon incidentally referred to the scene between Evans and Adams, and the bitter assault of Evans, and said, "I have been waiting, Mr. Evans, for Adams's answer to you, but I fear we are doomed to disappointment." "Well," said Evans, smiling, "I have been waiting for the old man to attack me, but he will not do it, I believe. Had he attacked me, you would have heard one of the most brilliant *extemporaneous* efforts ever delivered in this House, which *I have been preparing for four months.* But I am glad Adams *has not come at me again.*"

This is not the only instance where so-called extemporaneous efforts have been prepared for a long time. Ogden Hoffman told an old member of Congress that he watched his opportunity for a whole year to attack Mr. Cambreleng, one of his colleagues from New York. At last the opportunity arrived, and Hoffman assailed Cambreleng in a masterly speech which electrified the House, but which Hoffman had prepared with the greatest care, and which to the members appeared to be wholly an extemporaneous effort.

GREELEY AND THE "EVENING JOURNAL."

It is now thirty-two years since I sat side by side with Horace Greeley at a reporter's desk in the Senate of the State of New York. The Whigs at the preceding election had obtained complete control of the Legislature for the first time since the party which opposed the administrations of General Jackson and Mr. Van Buren adopted that term to designate the organization. Mr. Seward was elected Governor over Governor Marcy in 1838, and a majority of the House of Assembly was chosen from that party the same year, as it had been in 1837. But the Senators being elected by classes, under the constitution of 1821, only one going out yearly from each of the eight Senatorial districts, the Democrats retained the ascendency in that body until 1840. The Whig leaders, notably Messrs. Seward and Weed, wishing to reap all the advantages of the new situation, and to consolidate and strengthen the party with reference to future operations, imported Mr. Greeley from New York to act as reporter for the *Evening Journal*, and to contribute to its editorial columns as occasion might require. The *Journal* was at that time one of the very ablest papers in the country. Governor Seward and John

C. Spencer, then Secretary of State, were among its frequent contributors. Mr. Loveridge, invited to Albany from Troy by the Governor with the promise of being surrogate of the county, wrote regularly for the *Journal*. He was a man of fine genius, a ready and very forcible writer, and his editorial contributions were much admired. Mr. Weed, a very forcible and admirable paragraphist, more distinguished as a party manager than as a newspaper writer, but quite equal to the popular requirements of that day, wrote short, stirring articles that were much admired all over the country. His style was terse, compact; he was aggressive and dictatorial; he made his assertions positively and dogmatically, rarely attempted to argue a question, and never wasted his time in defending an untenable position. What passed for capital newspaper writing at that time would make no impression on the public mind to-day.

Journalism thirty or forty years ago was a feeble instrumentality compared with the great, comprehensive, and ably written newspapers of the present day. Here and there the rival parties had an organ of great power and corresponding influence. In fact, it may be doubted whether the authority of individual journals such as the Washington *Globe*, Albany *Argus*, Richmond *Enquirer*, Charleston *Mercury*, Isaac Hill's *New Hampshire Patriot*, and the *Courier and Enquirer* was not greater than that exercised by an equal number of newspapers scattered over the country at the present day. What I mean to say is, that the newspaper press of 1873, considered in the aggregate, controls public opinion, influences the action of Congress, and checks legislative and municipal rascality to an extent of which the last generation had no conception. The amount and variety of mental labor bestowed upon a daily issue of one of the great metropolitan papers would have served the average newspaper of forty years ago for a month. In our large Western towns newspaper establishments have grown up rivaling in the completeness of their appointments, the ability with which they are conducted, the extent and variety of resources, and the amount of receipts the average of the journals of the great Atlantic cities. Probably the country press generally has less weight and consideration now than then. The general tendency is to centralization. Railroads and telegraphs have increased the importance of the great centres, politically and otherwise, while the consequence of interior localities has been proportionally diminished.

Probably there was no more effective provincial political instrumentality in the country than the *Evening Journal;* but the paper was a means rather than an end with Mr. Weed. He was an ambitious, aspiring man, and he prided himself more upon his position as a leader in the party than as the head of a great newspaper. But he was often baffled by the stronger will of his political associates. Lewis Benedict was one of the controlling spirits of the Whig party. He insisted that his son should have the office of surrogate; and such was the force of his will and determination that he defeated Weed, overawed the Governor, and constrained him to forfeit his voluntary pledge to Loveridge. This controversy led to a quarrel between Weed and Benedict, the retirement of Loveridge, and the necessity for the services of Greeley on the *Journal*. He was not a good reporter, for he preferred to state what ought to have been said by Senators rather than to give their own language, and this course gave great offense. General Root, Mark Sibley, and other prominent men in the body were annoyed at Greeley's methods, and remonstrated with much earnestness both with Weed and Greeley himself. Greeley was no more amenable to criticism or advice a third of a century ago than during his maturer years; so he threw up his engagement in a paroxysm made up of indignation and disgust, and returned to New York.

Greeley wrote at that time with the same ease and fluency which marked his productions at a more mature age. Perhaps there was less compactness and simplicity then, and the severe conciseness of style which he attained in his later years was not noticeable in his earlier days. His diction resembled closely that of Cobbett, although it was not so deformed by the coarseness which offended readers of refined and cultivated taste in the writings of the sturdy old Englishman. Greeley was always perspicuous and forcible, rarely used a superfluous or inaccurate word, and his services with the pen were highly estimated by the Whig leaders. But his feelings were deeply wounded by the criticisms to which his conduct as reporter in the Senate was subjected by Senators and others, and as no concessions were made to assuage his griefs, a renewal of his relations with the Whig leaders at Albany was not practicable.

IN ABSENCE.

Though spices lure me, and the rose-tree throws
Its heart of fragrance to beguile the sense—
Though warm airs woo me, and the beauty grows
Intense—
Though sunsets ravish with their blue and gold,
And amber moons enchant the tropic zone,
Love grows a-weary, and my heart a-cold,
Alone!
Then come, my darling, come again to me,
Nor linger longer on the far-off shore;
Between us there shall roll the cruel sea
No more.
I long to clasp you in a fond embrace,
And tell you, tell you with my every breath,
I ne'er again will miss your loving face
Till death.

SIGNERS OF THE DECLARATION OF INDEPENDENCE.

By BENSON J. LOSSING.

[First Paper.]

WE are all familiar with the *signatures* of the men who subscribed their names to the Declaration of Independence, but few of us know how they wrote in the text of letters or other writings, or their methods of expression in epistles. To reveal their styles of penmanship, and modes of some of them in the expression of their thoughts in letters, is the chief object of these papers.

The materials for such revelations have been drawn from the full treasury of autographic and pictorial wealth of Thomas Addis Emmet, M.D., of the city of New York. He kindly gave the freedom of its range to the writer, who has already, in a preceding number of this Magazine, spoken of Dr. Emmet's rare collections and his generous use of them. He owns autograph letters of every signer of the Declaration of Independence excepting Button Gwinnett, of Georgia, from whose hand, it is believed, none exists in this country—only his signature to letters—and John Hart. Dr. Emmet also owns a large number of autograph letters of persons of eminence who corresponded with the Signers, or with others, upon topics connected with the earlier history of our republic, together with valuable manuscript documents, contemporary newspapers, political broadside publications, and thousands of pictures, such as portraits of men and women, buildings and scenery, in America, and illustrations of remarkable events in our history. These he has used in illustrating, in the peculiar manner known as "laying down," on fine drawing paper, a *Biography of the Signers of the Declaration of Independence*, written by John Sanderson, Robert Wain, Jun., and others, and published originally in Philadelphia, in seven volumes.

By the mode of illustrating above alluded to an edition of *nine* octavo volumes has, under the hand of Dr. Emmet, expanded into *nineteen* folio ones, with a title-page for each, and a printed index for the whole. There are in the whole work, so enlarged, almost 3000 illustrations, of which there are 1396 portraits (80 of them in water-color), 935 views of places, things, and events, 324 autograph letters and documents, and 136 head and tail pieces on India paper, and exquisitely engraved. Among the water-color sketches are portraits of fifty-one of the fifty-six Signers. In the introduction are portraits and autographs of Charles the Second and the first three Georges, of Louis XIV., William Penn, the Duke of Marlborough, Oglethorpe, John Hampden, and others, with those of Napoleon the First. Dr. Emmet has illustrated the lives of the generals of the Revolution in the same way.

From these superb, nay, wonderful volumes, illustrative of the lives of the Signers, have been drawn the chief materials for the construction of these papers. The illustrations consist of an engraved fac-simile of a sentence in a letter, by which the style of the handwriting of each Signer is shown, with that of his signature to such letter. Full copies, or extracts, or a synopsis of the contents of these letters are given, with notes explanatory of facts and allusions contained in them, with brief sketches of the writers. The names of the Signers so treated are here presented in alphabetical order. The following preliminary observations are made in elucidation of the subject:

Early in June, 1776, Richard Henry Lee, of Virginia, offered a resolution in the Continental Congress, then sitting in the State-house at Philadelphia, "That these united colonies are, and of right ought to be, free and independent states; and that all political connection between us and the state of Great Britain is, and ought to be, totally dissolved." Further action on this resolution was postponed till the 1st of July following. Meanwhile a committee of five, of which Thomas Jefferson was chairman, were appointed to prepare a Declaration of Independence, that no time might be lost in the event of the passage of Lee's resolution. To the ready pen of Jefferson was assigned the task of writing it; and after several amendments made by others of the committee had been agreed to, a copy, in the chairman's small round hand, was reported with the resolution. On the 2d of July that resolution was passed, but debates on the form of the Declaration continued until the 4th, when it, too, was adopted, at about the hour of two o'clock in the afternoon. It was signed on that day by John Hancock, the President of Congress, only. It was ordered to be engrossed on parchment, and the copy so prepared to be signed by all the delegates who had voted in the affirmative. That important act was performed on the second day of August following, when the names of the fifty-four delegates then present were affixed to the document. It was afterward signed by two others—Thomas M'Kean, of Delaware, and Matthew Thornton, of New Hampshire. The former was absent in August with a regiment of *City Associators* of Philadelphia, and the latter was not a member of Congress until the succeeding autumn, when he obtained permission to sign it.

In compliance with an order of Congress given on the 13th of January, 1777, an authenticated printed copy of the Declaration, with the printed names of the members who had subscribed to the same, was sent to "each of the United States," with a request that they should "have the same put on record." To each of these copies the autograph signature of John Hancock, as President of Congress, and that of Charles Thomson, as secretary of that body, were attached. These broadsides were printed in Baltimore by Mary Katharine Goddard, a sister of William Goddard, printer. Her brother was embarrassed in his business, and she ably conducted his affairs in her own name for about eight years, from 1773. One of these broadsides is in Dr. Emmet's collection.

First in the order we have chosen appears the name of

JOHN ADAMS.

He was an honest, impetuous, outspoken man; vain, egotistical, opinionated; a close observer of men and things, too frank for a successful partisan politician or diplomate, and an unselfish patriot. The following letter, never before published, written from Passy, near Paris, on the 7th of December, 1778, is so characteristic of the man, and so full of interesting gossip concerning his colleagues, that I give it in full. Mr. Adams was then forty-three years of age, and was joint commissioner of the United States at the French court with Dr. Franklin and Arthur Lee. He had succeeded Silas Deane in April of that year. Finding a want of harmony between Franklin and Lee, he had advised Congress to intrust the mission to one man, expecting, perhaps, that John Adams would be that person. The election of Dr. Franklin to be "Minister Plenipotentiary," in September, showed a disposition on the part of Congress to make the Sage the sole commissioner, which they did. Adams had doubtless heard of this measure, and that intelligence evidently inspired and gave tone to his letter. The custom then prevalent of using capital initials for the names of nouns, and sometimes of other parts of speech, is well illustrated in this letter. In all the other letters the modern style will be followed in the printing. Here is the epistle:

"I wish I could unbosom myself to you without Reserve concerning the state of affairs here, but you know the danger. The two Passions of Ambition and Avarice, which have been the Bane of Society and the Curse of human Kind in all ages and countries, are not without their Influence upon our Affairs here, but I fancy the last of the two has done the most mischief. Where the Carcass is, there the Crows will assemble, and you and I have had too much Experience of the Greediness with which the Loaves and Fishes were aimed at under the old Government, and with which the Continental Treasury has been sought for under the new, to expect that the Coffers of the American Banker here would not make some men's Mouths water. This appetite for the Banker's Treasure I take to have been the source of most of the Altercations and Disputations.

"Your Old Friend [meaning John Adams] is a man of Honor and Integrity, altho', to be very frank and very impartial, he can not easily at all Times, any more than your humble Servant, govern his Temper, and he has some Notions of Elegance, Rank, and Dignity that may be carried rather too far. He has been of opinion that the public Monies have been too freely issued here, and has often opposed. The other you know personally [meaning Dr. Franklin], and though he loves his ease, hates to offend, and seldom gives any opinion until obliged to do it, I know also, and it is necessary you should be informed, that he is overwhelmed with a correspondence from all Quarters, most of them upon trifling subjects, and in a more trifling Style, with unmeaning Visits from Multitudes of People, chiefly from the Vanity of having it to say that they have seen him.

"There is another thing which I am obliged to mention: there are so many private Families, Ladies and Gentlemen, that he visits so often, and they are so fond of him that he can not well avoid it, and so much Intercourse with Academicians, that all these Things together keep his Mind in such a constant state of Dissipation, that if he is left alone here the public Business will suffer in a degree beyond Description, provided our Affairs are continued upon the present footing. If, indeed, you take out of his Hands the Public Treasury, and the Direction of the Frigates and Continental Vessels that are sent here, and all Commercial Affairs, and intrust them to Persons to be appointed by Congress, at Nantes and Bordeaux, I should think it would be best to have him here alone, with such a Secretary as you can confide in; but if he is left here alone, even with such a Secretary, and all Maritime and Commercial and pecuniary, as well as political, affairs are left in his Hands, I am persuaded that France and America both will have Reason to repent it. He is not only so indolent that Business will be neglected, but you know that altho' he has as determined a soul as any Man, yet it is his constant Policy never to say yes or no decidedly but when he can not avoid it; and it is certain that in order to preserve the Friendship between the two Countries your Minister here must upon some occasions speak freely and without Reserve, preserving Decency and Politeness at the same Time.

"Both he and the other Colleague were, I am sorry to say it, in a constant opposition to your Old Friend, and this Misunderstanding was no secret at Court, in

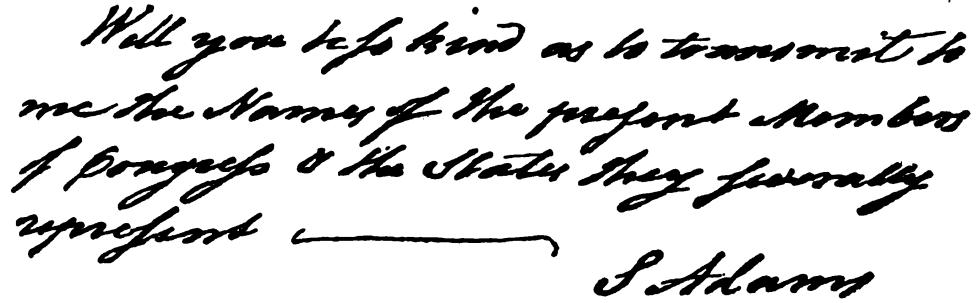
the City, or in the Sea-port Towns, either to French, English, or Americans, and this was carried so far that Insinuations, I have been told, have been made at Court against your Old Friend [the writer], not by either of his Colleagues, that I have ever heard, but probably by somebody or other emboldened by and taking advantage of the Misunderstanding among the three, that he was too friendly with his Lordship, and was much attached to Lord Shelburne, and even that he corresponded with his Lordship, and communicated Intelligence to him. This, whoever suggested it, I am perfectly confident was a cruel Calumny, and would not have made an Impression if the Colleagues had contradicted it in the manner that you and I should have done. You and I had opportunity to know his attachment to our Cause long before Hostilities commenced, and I have not a color of ground for Suspicion that from that Time to this he has deviated an Iota from the Cause of his Country in Thought, Word, or Deed. When he left England, or soon after, he wrote a letter of mere Compliment to his Lordship, a mere Card to bid him farewell, and received such another in return, which, he assures me, are all the Letters that ever passed between them, and I have not a doubt of the Truth of it.

"The other Gentleman, whom you know, I need not say much of [meaning Arthur Lee]. You know his Ambition, his Desire of making a Fortune, and of promoting his Relations. You also know his Art, and his Enterprise. Such Characters are often useful, altho' always to be carefully watched and controuled, especially in such a Government as ours.

"There has been so much said in America and among Americans here about his making a Fortune by Speculating in English Funds, and by private Trade, that it is saying nothing new to mention it. Our Countrymen will naturally desire to know if it is true, and it will be expected of me that I should say something of it. I assure you I know nothing about it. An intimate Friend of his, who recommended the Major to you, certainly speculated largely in the Funds, from whence suspicions arose that the other was concerned with him, but I know of no Proof that he was. Combinations, Associations, Copartnerships in Trade, have been formed here, in which he and his Brothers are supposed to be connected, but I know nothing more than you do about them. But supposing it was proved y^{t} he speculated and traded, the Question is whether it was justifiable. Neither you nor I should have done it, most certainly. Nor would it have been forgiven in either of Us. Whoever makes Profits in public Life, neither of Us must be the Man. But it does not prove it unlawful in him. If he did not employ the Public Money, nor so much of his Time as to neglect the Public Business, where is the Harm? that is the Question; and it ought to be remembered that he was here a long Time, not as Ambassador, Envoy, Commissioner, Minister, or in any other Trust or Character, from Congress, but merely as an agent for the Committee of Commerce and Correspondence.

"Some of the Gentlemen of Character who are now in America from this Country have had Prejudices imprinted into them against your old Correspondent [the writer]. I am extremely sorry for this, because I think it is against a worthy Character, and because it will be likely to have unhappy Effects both with you and abroad.



"The other Gentleman [meaning Silas Deane], whose consolation when left out by his first constituents was that he stood well with the Body to which he was sent, consoled himself, also, when recalled by that body, with the thought that he was esteemed by ye Court where he had resided. This, no doubt, will be displayed in all its variegated colors. The letter from the Minister expressing his Esteem, the Present from an higher Personage [the King of France], and, above all, the Fleet [of Beaumarchais], and the Magnificence y^{t} accompanied it, will be all repeated and rung in changes in order to magnify Merit; yet I am sorry to see in the Newspapers such expressions as these, 'Mr. ——, who was the principal Negotiator.' Such expressions, if true, might not to be used, because they have only a Tendency to occasion Division and Animosity, and can not do any Good. But there is Cause to doubt the Justice of them. In short, I think, upon an Examination of the Treaties, and a comparison of them with the Treaties and Instructions sent from Congress —I think it was probable that there was not much Discussion in the Case. I wish with all my heart there had been more.

"This Letter is not so free as I wish to write you, but still it is too free to be used without Discretion. You will use it, accordingly, only for the Public Good. Knowing the Animosity that has been in two against me here, which I believe to have been [carried to an] unwarrantable length, knowing the Inveteracy of many subalterns and collateral Characters, which I think is injurious to the individual as well as the Public, and knowing that you will have these Things in Contemplation and much at Heart, I have said thus much of my Lieutenants upon this subject, which, I hope, will do no Harm."

SAMUEL ADAMS.

One of the sternest and most uncompromising of the Puritan patriots who worked unselfishly to secure our independence was Samuel Adams, who was fifty-two years of age when he entered the First Continental Congress, in 1774. At every stage of the great Revolution of which that Congress was a forerunner, he was among the boldest of his compatriots in the enunciation of the rights of the people and denunciation of the wrong-doings of their oppressors. He shrank from no duty, and feared no man. When General Gage advised him to make his peace with his king, the austere Puritan replied, "I trust I have long since made my peace with the *King of kings*. No personal considerations shall induce me to abandon the righteous cause of my country."

In a letter in the collection before me, written at Boston on the 17th of December, 1785, to Richard Henry Lee, Mr. Adams

Last monday we had an account that Col Bidel with 300 or 400 men were cut off at the Cedars above Montreal

Josiah Bartlett

congratulates the Virginian on his re-election to Congress, by which he was again "honored with the confidence of his countrymen," his fellow-citizens of Virginia. He expresses the wish "that the seats in that sacred hall might ever be filled with men of true wisdom. This wish," he continues, "I know can not be gratified when the United States shall become debased in principles and manners." He calls Mr. Lee's attention to his friend Captain Landais, whom both had "patronized" when he first came to this country. Landais was a French naval officer, of a noble but impoverished family. He had been dismissed from the French navy on account of his irascible temper. He entered the naval service of the United States in the summer of 1778 as captain; was placed in command of the *Alliance*, one of the squadron under Paul Jones, and was with that commander off the mouth of the Humber when the *Bon Homme Richard* and *Serapis* had their terrible fight in the autumn of 1779. His insubordination on that occasion caused his dismissal from the service, and he passed the remainder of his days, prolonged to eighty-six years, in poverty in the city of New York. Adams regarded him as a persecuted man, and was his active friend. To Lee he wrote:

"He [Landais] had long suffered, as other virtuous men had, by a faction on the other side of the Atlantic, which found means to extend itself to this country, and, as you will remember, to the very doors of Congress. But enough of this. Your kind assistance was greatly beneficial to him in his late application to Congress, and he and I gratefully acknowledge it. But he remains still unsatisfied, and, as I conceive, not without reason. His pay as commander of the *Alliance* is offered to him. If you think as I do, that he has a right to authentic copies of letters written by Jones to Congress or any of the boards on our affairs, so interesting to him, on his proper application, your advice to him on this, as well as his other concerns, will add to the obligations I am already under to you.

"Will you be so kind as to transmit to me the names of the present members of Congress, and the States they severally represent?"

JOSIAH BARTLETT.

Dr. Bartlett, a delegate in the Continental Congress from New Hampshire, was forty-six years of age, and had been in his seat almost a month, when, on the 6th of June, 1776, he wrote a letter from Philadelphia to General Folsom on the topics of the day. He mentioned the inclosing of a newspaper to the general, which contained an address of the city of London to the king. He continued:

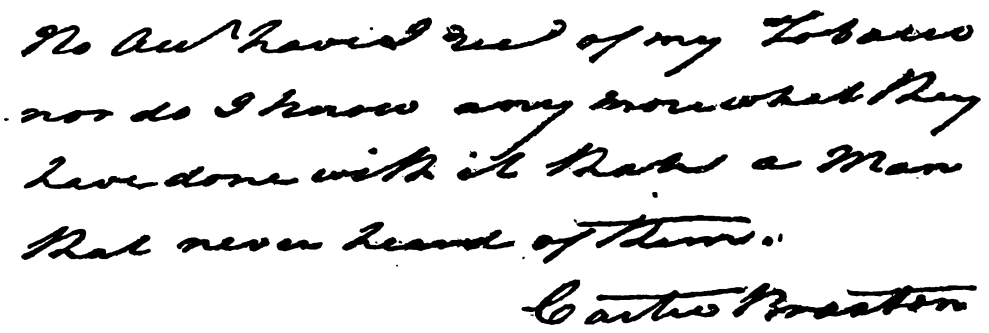
"The affair of declaring these colonies independent states, and absolved from all allegiance to the crown of Britain, must soon be decided, whatever may be the opinions of the delegates of New Hampshire on that subject. They think it their duty to act agreeable to the minds of their constituents, and in an affair of that magnitude desire the explicit directions of the Legislature of the colony, and that it may be forwarded to us as soon as possible."

The day after this letter was written Richard Henry Lee offered his resolution for independence in Congress.

Alluding to the unfortunate affair at the Cedars, on the St. Lawrence River, where troops under Colonel Bedel, of New Hampshire (though not then in his personal charge), were defeated, Dr. Bartlett wrote:

"Last Monday we had an account that Colonel Bedel with 300 or 400 men were cut off at the Cedars, above Montreal."

Conflicting stories about the affair reached Philadelphia, and the doctor was disposed to doubt the truth of any of them.



Dr. Bartlett concluded his letter with the important news that two privateers from Philadelphia had captured three large sugar ships, with a large quantity of sugar, and $20,000 in specie.

Dr. Bartlett was a very active partisan during the whole war for independence. Passing through grades of judicial service, he became Chief Justice of New Hampshire in 1788. He was Governor of the State in 1793.

CARTER BRAXTON.

This eminent Virginian was the son of a wealthy planter, whose wife was a daughter of Robert Carter, at one time President of the Council. At the time when he wrote the letter in the collection before me, on the 10th of October, 1772, Mr. Braxton was thirty-six years of age. He was then in active

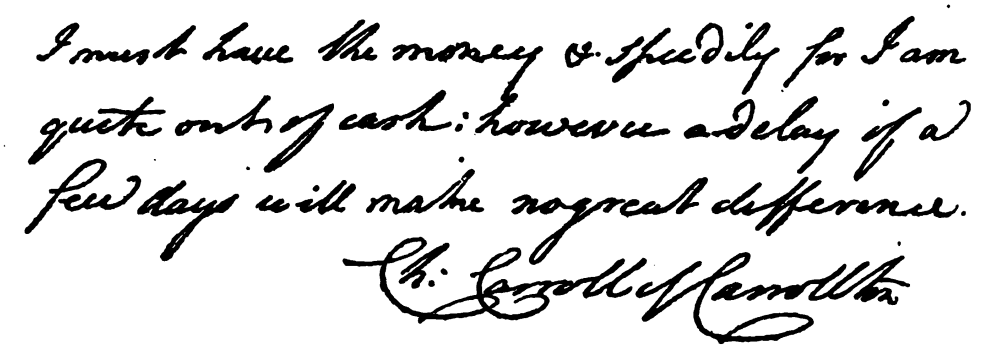
public life, and living elegantly and expensively, as was the custom among rich Virginia planters at that time. Two years later he was a member of the last House of Burgesses convened under royal authority, and in 1775 he was elected to succeed the dead Peyton Randolph in the Continental Congress. His epistle alluded to is only a business note, in which he says, "No account have I received of my tobacco, nor do I know any more what they have done with it than a man that never heard of them."

Disastrous commercial operations during the Revolution wasted Mr. Braxton's great fortune. It was totally wrecked, and he died a heart-broken paralytic at the age of sixty-one years.

CHARLES CARROLL.



The last survivor of the fifty-six signers of the Declaration of Independence, and the bearer of the most honored crown of a long life, was Charles Carroll of Carrollton, who was born at Annapolis, and who died in Baltimore at the age of ninety-five years. He was the inheritor of an immense fortune, and was a Roman Catholic in religion by birth and education. He early espoused the cause of his countrymen, and all through the war for independence he was one of its stanchest supporters. He entered Congress on the 4th of July, 1776, and on that day voted for and signed the Declaration. The story that on writing "of Carrollton" after his signature to that document, he remarked, "Now the King of England will know where to find me," is a fiction. It was a surname given him in early life to distinguish him from another. His signature to the letter from which our illustrative *facsimile* has been made, dated more than two years before the declaration of independence, proves this. That letter is only a brief business one.

John Adams and Thomas Jefferson died on the fiftieth anniversary of the declaration of independence, in 1826, leaving Mr. Carroll the sole survivor of the Signers for about six years.

SAMUEL CHASE.

This distinguished Marylander was thirty-five years of age when he signed the Declaration. He was a member of the Continental Congress from its first session in 1774, and was one of the most sensible and active men in that remarkable body. In the spring of 1776 he, with Franklin and Carroll, was charged with the important duty of going to Canada, clothed with the executive powers of Congress, to regulate the army there, and to establish a republican government on the St. Lawrence, if possible.

When, later in that year, Washington was pursued to the Delaware by a large British force, and Philadelphia was menaced, Congress fled to Baltimore, leaving a representative committee behind them, of which Robert Morris was chairman. A fortnight after the battle at Princeton, at the beginning of January, 1777, Congress resolved to appoint a committee of seven to inquire into the conduct of British and Hessian officers and soldiers toward American officers, soldiers, marines, and citizens. Mr. Chase was made chairman of the committee then raised, and on the 23d of January he wrote to the committee of which Morris was the head, saying:

It is reported here that several of our officers were shot or stabbed with the Bayonet, after they had surrendred, Genl. Mercer and Lieut. Yeates are mention'd among that Number.

Sam.l Chase

"The committee appointed by the inclosed resolution of Congress request your honorable body to appoint some gentlemen to inquire into and take depositions of credible witnesses in the general matters contained in the resolves, and to direct them to transmit the testimony, as taken, to the committee, that they may report to Congress as soon as possible.

"The committee have been informed that some of the prisoners of the Seventeenth or Fifty-fifth regiments, taken at Princeton, have said that their major had given them orders 'to stand until they were cut to pieces, and take no prisoners.'

"It is reported here that several of our officers were shot, or stabbed with the bayonet, after they had surrendered. General Mercer and Lieutenant Yeates are mentioned among that number. It is also said that several bodies have been found in the Jerseys hanging on trees."

The services of Mr. Chase during the Revolution can not be estimated. He was a great and incorruptible judge—fearless in duty, outspoken in favor of right, inflexible in the support of law, and extremely dignified and patient under the sharpest political persecutions, because he was conscious of dutiful behavior.

ABRAHAM CLARK.

This distinguished Jerseyman entered the Continental Congress as a delegate about a fortnight after Mr. Lee offered his resolution for a declaration of independence. He was then fifty years of age. Under the force of instructions from the Provincial Congress of New Jersey, and the impulses of his own heart and judgment, he strongly advocated that measure. He was a vigilant and intelligent observer of passing events, and kept himself and leading friends thoroughly informed upon public matters which came under his observation. From his home at Elizabethtown he wrote, on the 14th of July, 1776, a long letter to Colonel Elias Dayton, then in command of New Jersey troops at the German Flatts, in the Mohawk Valley, in which he gave an account of the arrival of British troops, under General Howe, at Staten Island, and their treatment of the inhabitants, of the generous zeal of Pennsylvania troops for the defense of menaced New Jersey, of the fortifications constructed by the Americans in that part of the State, and of the plot, then lately discovered in the city of New York, to destroy Washington with poison.

"As to the plot," he wrote, "I can inform you but little. The mayor is confined—one Forbes appears to

Our Declaration of Independance I dare say you have seen—a few weeks will probably determine our Fate—perfect Freedom, or Absolute Slavery—to some of us Freedom or a halter—

We met on Friday evening, named a Chairman, a Committee to draft rules, and agreed to meet again—

G. Clymer

have been very active in it, and all centres in Governor Tryon. Many have absconded from New York; none in New Jersey are implicated—at least nothing proved against them. Governor Franklin is sent prisoner to Hartford, in Connecticut."

Tryon was undoubtedly the instigator of the plot to murder the American general officers in New York, and Mayor Mathews was his chief lieutenant. Gilbert Forbes was a gunsmith. One of Washington's Life-Guards, named Hickey, was concerned, and he was hanged. The mayor and about twenty others were sent into Connecticut.

Mr. Clark also wrote:

"Our Declaration of Independence I dare say you have seen; a few weeks will probably determine our fate: perfect freedom or absolute slavery; to some of us, freedom or a halter. Our fates are in the hands of an Almighty God, to whom I can with pleasure confide my own. He can save us or destroy us. His counsels are fixed, and can not be disappointed. All His designs will be accomplished."

Mr. Clark was an efficient worker in favor of a national Constitution, and in the national Congress he was distinguished as a rigid economist in the management of public affairs. He retired from public life in 1794, and in the early autumn of that year he died from the effects of what is called a "sunstroke."

GEORGE CLYMER.

Mr. Clymer, who was a native of Philadelphia, was a most ardent and active supporter of all measures opposed to the tyranny of the British ministry toward the American colonies. At the age of thirty-seven years he was elected one of the representatives of Pennsylvania to fill the places of those who had declined to vote for the declaration of independence. That was late in July, 1776, and he signed that instrument gladly on the 2d of August. All through the war, and for more than twenty years afterward, he was engaged in very responsible public duties, in which he displayed honor, decision, independence of action, and a thorough reliance upon his own clear judgment, which commended him to every honest man. The only letter of his now before me is without date, a portion of which relates to the formation of a society in Philadelphia, in which he wrote:

"We met on Friday evening, named a chairman, a committee to draft rules, and agreed to meet again. We persuaded Mr. Powell that his perfect leisure made him fit for the chair."

As there is no clew to the name of the society alluded to, we may conjecture that it was the "Philadelphia Agriculture Society," of which Mr. Clymer was made vice-president on its reorganization in 1805, eight years before his death.

WILLIAM ELLERY.

Early in the great struggle the name of William Ellery may be found among the foremost of the zealous patriots of Rhode Island. At the mature age of forty-nine

I am encouraged to expect this favour from you, Sir, because they are naturally and strongly disposed to assist others in vindicating their injured reputations.

William Ellery

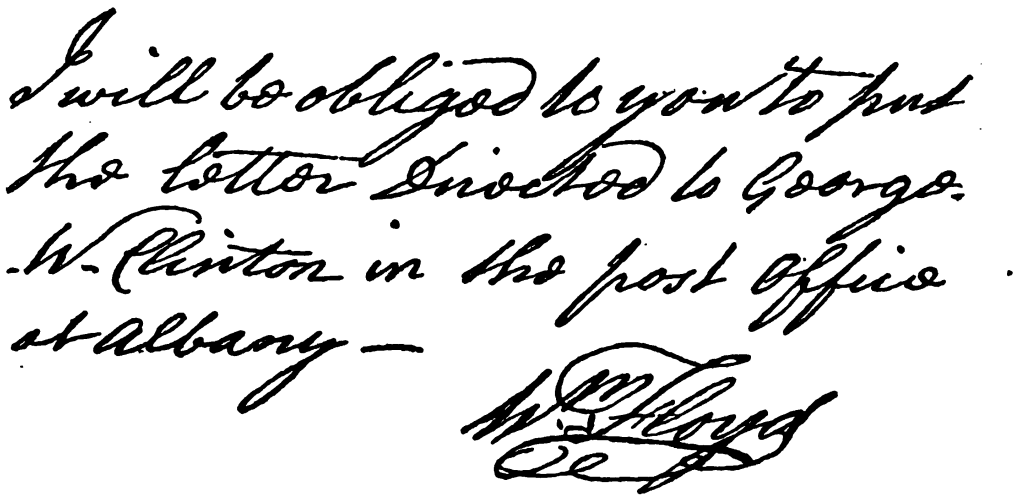
years he entered the Continental Congress (May, 1776) as the representative of that little colony, and the colleague of the venerable Stephen Hopkins. A good lawyer, a sound statesman, and a sagacious student of men, he brought to bear in that Continental legislature a maturity of judgment, a wisdom gained by experience and observation, and fixed principles which were of infinite value to the cause.

In the winter of 1777 and 1778 Mr. Ellery was supposed to have become somewhat entangled in the meshes of a scheme to put General Gates in the place of General Washington—a scheme known in history as Conway's Cabal, because General Conway, an Irish-French officer in the Continental army, was the most active among the conspirators. The fact of such suspicion having fallen upon Mr. Ellery seems to have been used against him, as the following letter, written by him at Newport on the 1st of September, 1782, to General Miller, of Warren, Rhode Island, attests:

"Since my return from Philadelphia I have been informed that the Hon. Daniel Mowrey has told you that I was an enemy to General Washington, and in proof of his assertion said that, upon a question in Congress whether General Gates should be commander-in-chief of the armies of the United States, I had voted for General Gates, or words to that purport, and that he had seen the vote in the journals of Congress, or had a copy of it at his house.

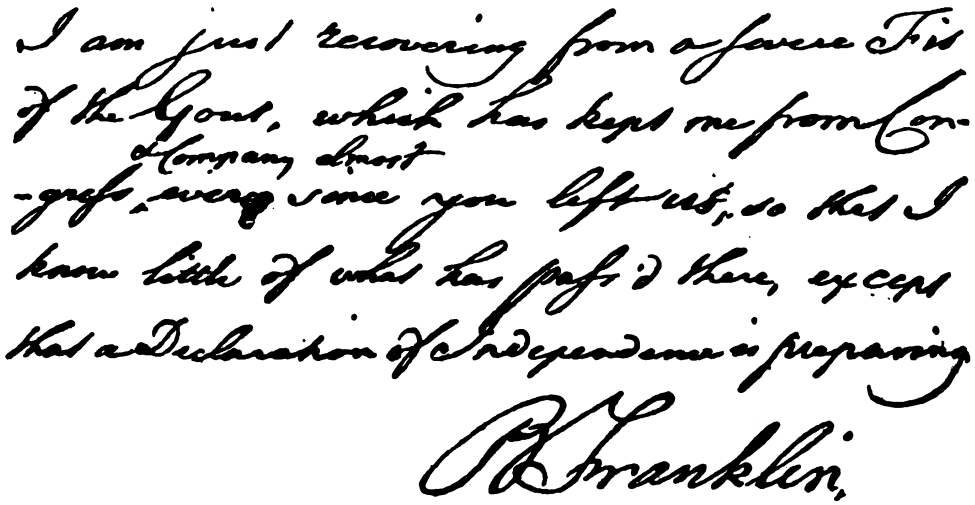


"As by a report of this sort my character hath been possibly affected in this State, I am determined to call on Mr. Mowrey for an explanation of his conduct in this instance; and in order to do it with propriety, I wish to know from you the expressions he made use of as exactly as you can recollect them.

"I am encouraged to expect this favor from you, Sir, because they are naturally and strongly disposed to assist others in vindicating their injured reputations who have a proper sense of true honor themselves."

Mr. Ellery suffered much from the ravages of war on Rhode Island, but losses only increased his zeal, and he represented that State during the war, and until the year 1785, when he retired from public life. He had always been a cheerful companion, and he died like a Christian philosopher, at the age of ninety-two years, while sitting upright in his bed, reading Cicero in the original.

WILLIAM FLOYD.



At the head of the names of the New York delegation affixed to the Declaration of Independence is that of William Floyd, of Long Island, a member of the First Continental Congress; he was kept continually in that body as a delegate until the autumn of 1777, when he took his seat in the Senate of the newly organized State of New York, to which he had been chosen. He had been a most industrious member of Congress, and was specially active in urging the necessity for a declaration of independence. He went back to Congress in 1779, but was recalled to the Senate of New York. Again he was sent to Congress, and remained in that body until the close of the war. He was chosen one of the first Representatives of New York in Congress after the adoption of the national Constitution, and from that time until his death, at the age of eighty-seven years, he was much in public life. He was forty-two years of age when he signed the Declaration. The letter, a part of which is here engraved, was wholly on business, and written at Boston in 1809, when he was seventy-five years of age.

BENJAMIN FRANKLIN.

The signature of the eminent American Sage was affixed to the Declaration when he was past seventy years of age. He had not then recovered from the great fatigue and exposure to inclement weather which he had lately endured while on a mission to Canada with Chase and Carroll. He had suffered greatly during a tempestuous voyage up the Hudson in a sloop, and a hard wagon ride to Saratoga; and there, at the home of Gen-

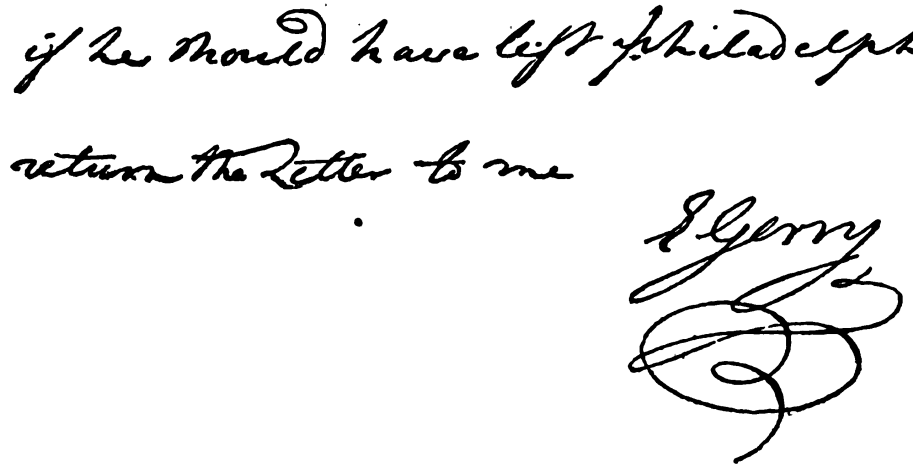
I am just recovering from a severe Fit of the Gout, which has kept me from Congress almost ever since you left us, so that I know little of what has passed there, except that a Declaration of Independence is preparing.

B. Franklin.

eral Schuyler, he wrote to Josiah Quincy, in Boston, "I begin to apprehend that I have undertaken a fatigue that, at my time of life, may prove too much for me, so I sit down to write to a few friends by way of a farewell." He lived fourteen years longer.

The following letter, written by Franklin at Philadelphia to General Washington, on the 21st of June, 1776, refers, in the second paragraph, to a cheering letter which the commander-in-chief had received from General Sullivan, who was on the Sorel, in command of the American army in Canada. Sullivan supposed the Canadians would soon show their old friendship for the Americans, when the success which he felt confident awaited him should inspire them, but a few days afterward he was flying out of Canada before a successful British force. Franklin wrote:



"I am much obliged by your kind care of my unfortunate letter, which at last came safe to hand. I see in it a detail of the mighty force we are threatened with, which, however, I think it is not certain will ever arrive. I see more certainly the ruin of Britain if she persist in such expeditions, which will probably prove more disastrous to her than anciently her wars in the Holy Land.

"I return General Sullivan's letter inclosed. Am glad to find him in such spirits, and that the Canadians are returning to their regard for us. I am just recovering from a severe fit of the gout, which has kept me from Congress and company almost ever since you left us, so that I know little of what has passed there, except that a Declaration of Independence is preparing."

Dr. Franklin's allusion to a "mighty force" is to German troops hired by the British monarch, and large reinforcements for the British army in America, which were then actually on the ocean coming hitherward. His letters all show much correction and interlineation.

ELBRIDGE GERRY.

The fifth signer of the Declaration was Elbridge Gerry, of Massachusetts. He was one of the younger members of the Continental Congress, being a little less than thirty-one years of age when he entered that body, in May, 1775. He had been for two years a very active and efficient member of the General Assembly of Massachusetts. He was very highly esteemed for his ability, honesty, and firmness by Samuel Adams, and was made a member of the first Com-

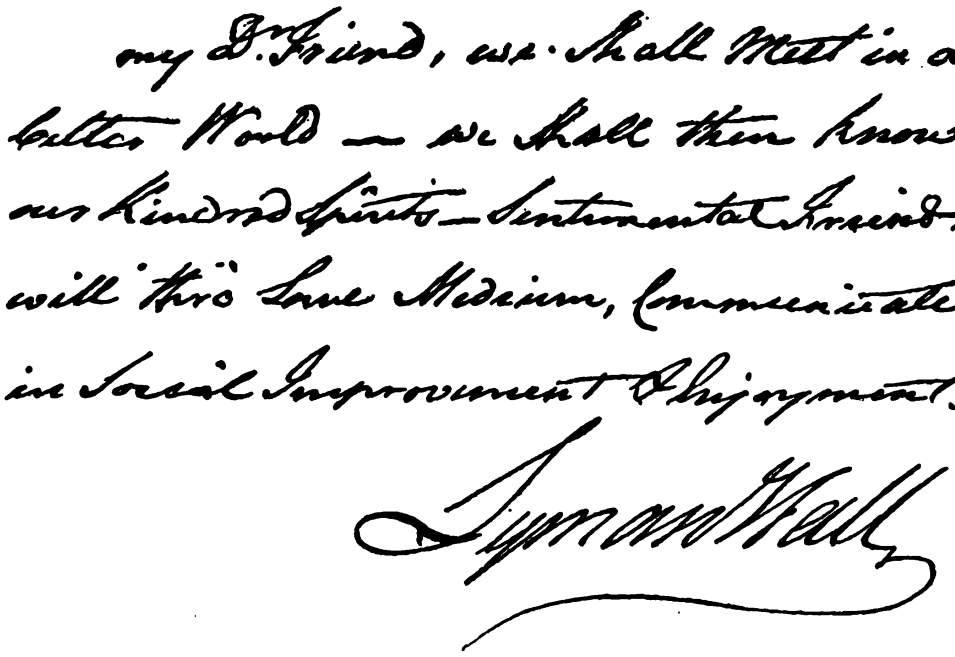
mittee of Correspondence, formed on the motion of Mr. Adams. His hand and voice were ever busy in patriotic work, and he was a leader in the Provincial Congress of Massachusetts when that body was organized; and in the stirring events at the time of the skirmishes at Lexington and Concord he was an active colleague with the Adamses, Hancock, Warren, and others.

The note from which the fac-simile of the writing of Mr. Gerry was made is only the cover to one for Colonel Monroe, directed to Colonel Timothy Pickering. It was written at New York on the 24th of August, 1775.

All through the war, and long afterward, Mr. Gerry was active in public life. He assisted in making the national Constitution, was sent by President Adams as envoy to France in 1797, was chosen to be the Democratic Governor of Massachusetts in 1811, and, after forty years of active public life, he was elected Vice-President of the United States in 1812. Mr. Gerry died suddenly in Washington city late in 1814, at the age of seventy years.



BUTTON GWINNETT.

Only the signature of Button Gwinnett may here be given, for the writer knows of no other specimen of his penmanship existing. It is copied from a long legal document, dated the 16th of March, "in the tenth year of the reign of George the Third," by which he conveys to parties in Savannah, for the term of five hundred years, a lease of 6200 acres of land on the island of St. Catharine, off the coast of Georgia, the consideration being £500. A mortgage on this property, executed by Gwinnett in 1765, mentioned in this document, proves that he was in this country five years earlier than any of his biographers have assigned as the date of his emigration from Wales.

Through the influence of Dr. Lyman Hall, Mr. Gwinnett was induced to take an interest in public affairs in 1775. His apparent apathy soon changed to blazing enthusiasm, and early in 1776 he was elected a delegate to the Continental Congress. He was not long in Congress, but took an active part in the politics of Georgia. Between himself and General M'Intosh, of that State, there arose a mortal animosity, which resulted in a duel and the death of Gwinnett, the challenger, on the 27th of May, 1777, when he was forty-five years of age.

LYMAN HALL.

Dr. Hall, a native of Connecticut, represented a patriotic parish of Georgia in the Continental Congress, when a large portion of the people of that State were disposed to adhere to the crown. He took his seat in that body, but did not become conspicuous, excepting as a Signer of the great Declaration. At the close of the war he was in Savannah, and from that city he addressed a letter to the Rev. Dr. Ezra Stiles, of New Haven, on the subject of the religious famine in Georgia, dated August 25, 1783. He speaks of an indifferent Episcopal clergyman in Savannah, the only one in regular orders in Geor-

gia, "either Presbyterian or Independent." He continues:

"There are a few illiterate Baptists in the back country, who preach to the people of their profession; one Dutch parson who can preach in English; so that it would be very difficult for a historian at this period to define our religion. We really want some serious, popular, and learned gentlemen of the clerical order, and I believe that such, in this fine country, will never want the means of living easily and genteelly. They should come in orders, as I know not, if necessary, where they could conveniently obtain them."

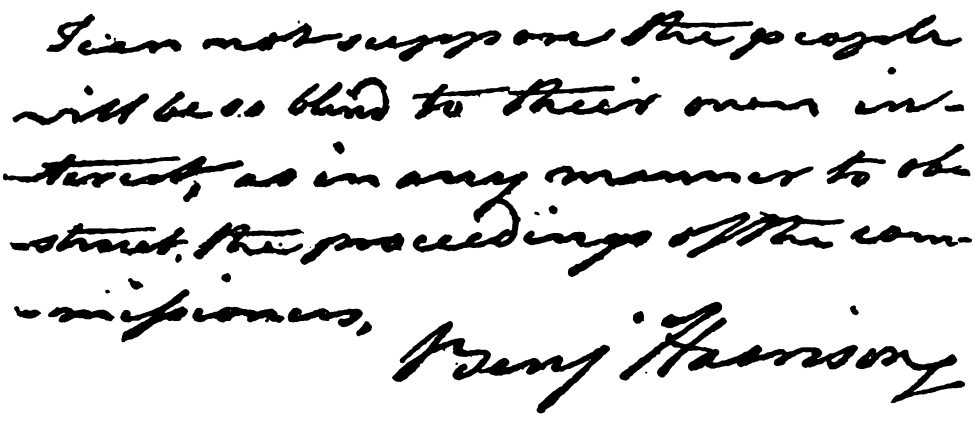
Dr. Hall mentions the fact that provision had been made by the State Legislature for building and endowing a seminary of learning, and expresses the belief that it will flourish, "for," he observes, "we are determined to invite the Muses to reside among us; those coy ladies have cautiously avoided any familiar intercourse with the Southern States, owing, I believe, to the careless and indifferent manner in which they have been addressed." The seminary alluded to is the Franklin University, at Athens, in Georgia, which was liberally endowed, but did not go into operation until the year 1801.

"As for me," Dr. Hall continues, "I wish to retire from public action to the shades of private life—to obtain a fixed composure, resignation, and readiness for my exit, which can not be far distant. My dear friend, we shall meet in a better world; we shall then know our kindred spirits; sentimental friends will, through some medium, communicate in social improvement and enjoyment."

Dr. Hall was then only fifty-two years of age; six feet in height and well-proportioned, but bearing the seeds of a disease which terminated his life in his sixtieth year.

JOHN HANCOCK.

This political and social leader in Massachusetts at the period of the Revolution was a colleague of Samuel and John Adams in patriotic movements at home, and also in the Continental Congress. He was two years the junior of John Adams; more elegant in manners than he, calm and dignified in deportment, and cautious and considerate in his expressions concerning the character and conduct of others. He was so active and influential a patriot that in 1775 he, with Samuel Adams, was excepted from the offer of a general pardon issued by Gage. At the head of the Massachusetts delegation in the Continental Congress in 1775, he was elected the president of that body at the opening of its session in May, and as such he placed his signature first to the Declaration of Independence the following year. It was a signature much bolder than the one here given, which is to a letter written by him at Boston on the 3d of April, 1783, to Sir Guy Carleton, then in command of the British forces in the city of New York. He wrote in behalf of Dr. Scollay, a Boston physician, who bore the letter, asking permission for the doctor to enter the city for the purpose of endeavoring to procure payment for medicines taken from his shops by British troops in Boston by order of their commander, and used in their service. Hancock wrote:



"I most earnestly request that your excellency will be pleased to permit the doctor to lay his accounts and representations before the proper officers, and as far as circumstances will admit, that the doctor may meet with recompense. He is a gentleman of an amiable character, and your excellency may depend that full reliance may be placed upon his representations; and I can with great truth recommend him as a gentleman of strict honor."

The honorable career of Mr. Hancock during the Revolution and afterward is too familiar to American readers to need further notice.

BENJAMIN HARRISON.

One of the most accomplished and useful of the men who figured in the Continental Congress was Benjamin Harrison, the owner of the fine estate of Berkeley, on the James River. Opulent, well-educated, refined, and talented, he became conspicuous in public life in Virginia at an early age. Before he

Digitized by Google

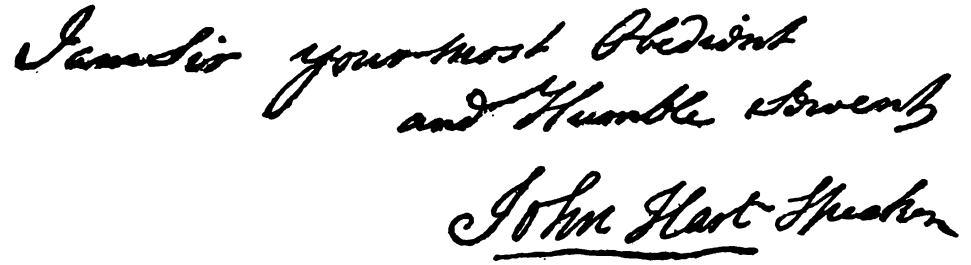
had quite reached his twenty-first year he was a member of the House of Burgesses, wherein he sat for several years by virtue of re-election; and he was such an active and efficient patriot that he was elected a delegate to the First Continental Congress in 1774. He was in the Congress of 1775, signed the Declaration of Independence, and in 1777 was chosen Speaker of the Virginia Assembly. He held that position until 1782, when he succeeded Thomas Nelson as Governor of the State.



The domain now known as Kentucky was then a part of Virginia, and emigrants to its rich lands were pouring over the mountains like a flood. Virginia commissioners were there to dispose of lands to actual settlers, determine boundaries, and otherwise to act for the public good. These were sometimes interfered with in the performance of their official duties, by the emigrants, especially by the class known as "squatters," who were disposed to assert the doctrine of "squatter sovereignty."

Among the commissioners was William Fleming, brother of Colonel John Fleming, who settled in that region in 1787, and in whose honor a county in the northwestern part of Kentucky was named. To William Fleming, then in Kentucky, Governor Harrison wrote from the council-chamber, on the 16th of September, 1782, saying:

"I can not suppose the people will be so blind to their own interest as in any manner to obstruct the proceedings of the commissioners, as their accounts can never be paid till they are settled by them; but if you should find them inclined to it, you and those appointed with you must take such methods for doing your business as you think will be most advantageous, and if a covering party or a sheriff is necessary, you must order them, though I beg you to avoid both if possible, as the country is by no means in a situation to encounter great expense. If a horse is necessary for the secretary, one must be provided, but the sum sent you is all that can be obtained for the use of all the commissioners, and you'll please to apportion it in such manner as you can agree upon."

JOHN HART.

Among the New Jersey men who signed the Declaration was John Hart, of Hopewell, who had led a most quiet and unobtrusive life up to the time when duty to his fellow-men required him to sacrifice his personal interest for the public good. He was the cultivator of a farm of four hundred acres, and was very little disturbed by the political events which were agitating the sea-port towns. He was a man of sound sense and moderate learning, and was called by his neighbors and friends "Honest John Hart." With that diadem he went into the First Continental Congress, in 1774, as a delegate, and continued to represent New Jersey until 1777, signing that document which prophesied of a struggle in which his fortune and his life might perish. He pledged both to the cause, and suffered much. He became an object of vengeance to the adherents of the crown, and was hunted in the forests like a wild beast; and for a while he and his family took shelter in a log-hut not far from his own comfortable dwelling. He was then an aged man, and in May, 1779, he died. A plain shaft of Quincy granite marks the place of his sepulture at Hopewell. It was erected by the State of New Jersey, as a token of public gratitude, and

was dedicated on the 4th of July, 1865, when Governor Parker delivered an oration.

The only writing of Hart's in the collection before me is a document the portion of which he wrote and signed being seen in the engraved fac-simile.

JOSEPH HEWES.

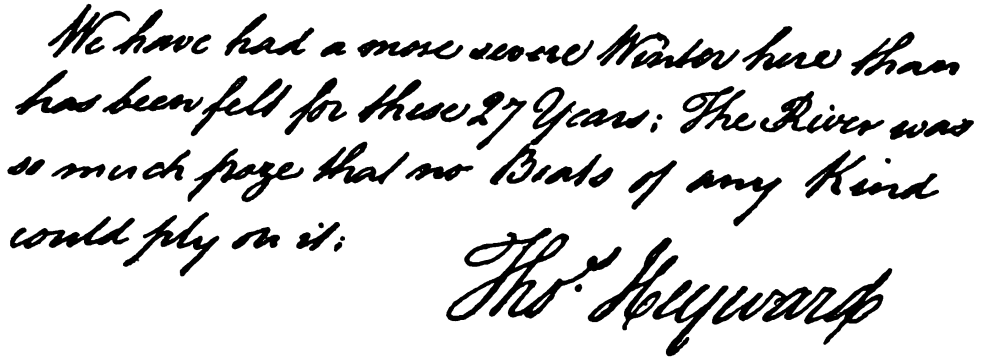
At the age of forty-six years Joseph Hewes signed the Declaration. Son of a New Jersey Quaker, educated at Princeton College, and bred a merchant, his life had been spent mostly outside of the stormy arena of politics. He had become a merchant at Edenton, North Carolina, at about the year 1760, and had held a seat in the Colonial Legislature, where he evinced qualities that induced the people to select him as their first delegate to the Continental Congress. He was a member of some of the most important committees in

the Congress which succeeded this, and, at the head of the Naval Committee, he was, in reality, our first Secretary of the Navy. In the same month that he signed the Declaration he wrote (July 28, 1776) from Philadelphia to Samuel Johnston, of Edenton, saying:

"Much of our time is taken up in forming and debating a confederation for the United States. What we shall make of it, God only knows. I am inclined to think we shall never model it so as to agree to by all the colonies. A plan for foreign alliance is also formed, and I expect will be the subject of much debate before it is agreed to. These two capital points ought to have been settled before our Declaration of Independence went forth to the world. This was my opinion long ago, and every day's experience serves to confirm me in that opinion. I think it probable we may split on these great points; if so, our mighty colossus falls to pieces, when (as our old friend Mr. Gordon used to say) we shall be in a whimsical situation.

"I have inclosed to R. Smith a newspaper which contains a state of what passed at the interview between General Washington and the adjutant-general of Howe's army."

Dr. Franklin had proposed a plan for a confederation of the colonies in 1775. In June, 1776, a committee was appointed to devise a plan. It was perfected in 1778, and in 1781 was ratified by the associated colonies. In September, 1776, commissioners were sent to France, and afterward to other foreign governments, to seek aid, recognition, and alliances.



The last paragraph of Mr. Hewes's letter alludes to a silly attempt of General Howe to ignore the official position of General Washington. He came in the double character of a warrior and a peace commissioner, and he sent a letter by his adjutant-general, Paterson, directed to "George Washington, Esquire." The American commander penetrated the design, and refused to receive any communication unless directed to "*General* Washington." Paterson urged Washington not to be punctilious, pleading the necessity of waiving all ceremony, for Howe had come to cause the sheathing of swords, if possible. Washington was inflexible, and Congress sustained him. Howe made no further attempts to communicate with "George Washington, *Esquire*."

Hewes was in delicate health. He resigned his seat in Congress in October, 1779, and died in Philadelphia a few weeks afterward.

THOMAS HEYWARD, JUN.

One of the younger signers of the Declaration was Thomas Heyward, Jun., a son of one of the wealthiest planters in South Carolina, who was only thirty years of age when he made that patriotic pledge of his "life

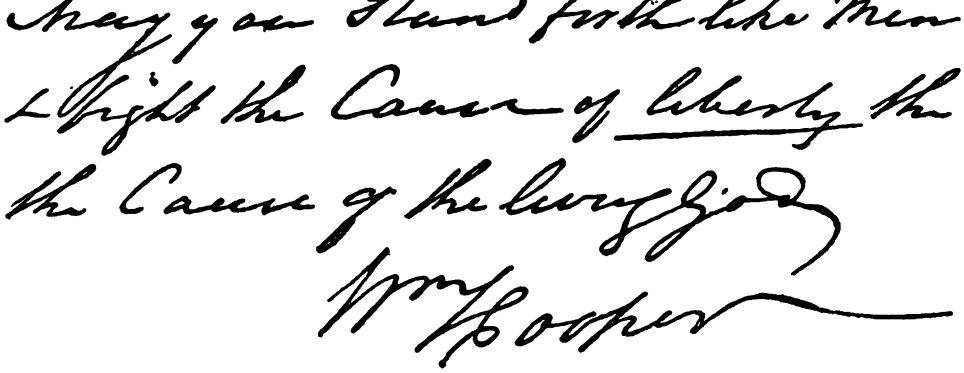
and fortune and sacred honor." After due preparations at home for a thorough training for the profession of the law, he was sent to London, where, in the Temple, he was a most industrious and intelligent student. In a long letter in the collection before me (written upon several quarto pages, in a very neat hand, to his father, from London), when he was only twenty-one years of age, he evinces the maturity of thought of a man of forty. It is a most remarkable letter, overflowing with expressions of the soundest principles of conduct, descriptions of proceedings in Parliament, and the thoughts and suggestions of a budding statesman when commenting upon schemes then (1767) before the national legislature for unjustly taxing the colonies. After speaking of his studies, his course of life, and his short-comings in duty, the amusements of the metropolis, etc., he wrote (February 11, 1767):



"We have had a more severe winter here than has been felt for these 27 years. The river [Thames] was so much froze that no boats of any kind could ply on it. Ships could not take in their loading, and tradesmen of all kinds, such as blacksmiths, shoemakers, etc., could do no work, which occasioned a great number of beggars on the streets, and gave to many an opportunity of covering a multitude of sins by charity."

After he had completed his studies, young Heyward spent several years in visiting various countries in Europe; but, with the spirit of a true patriot, he was never dazzled with the displays incident to monarchical institutions. He returned home a thorough republican, and when sent to the Continental Congress in 1775, he was among the foremost opposers of British oppression. During a greater portion of the war he was active in public duties, civil and military, and was a prisoner at St. Augustine for a year. After the war he served in a judicial capacity, withdrew from public life in 1791, and died in the spring of 1809.

WILLIAM HOOPER.

Another of the younger members of Congress who signed the Declaration was William Hooper, who was thirty-four years of age at that time. He was a native of Boston, and a lawyer by profession. His father was a minister of the Gospel, and wished him to follow in his footsteps, but he preferred the law. He studied under James Otis, and at the age of twenty-two years he went to North Carolina, settled in Wilmington, became a member of the House of Commons of that State in 1773, and with eloquent tongue and pen he opposed the taxation measures of Great Britain. A delegate in the First Congress, he drew up the able address to the people of Jamaica put forth by that body. Soon after he signed the Declaration, pecuniary embarrassment compelled him to return home.

It was while he was in Congress that, on the 6th of February, 1776, Mr. Hooper wrote to a friend at home, saying:

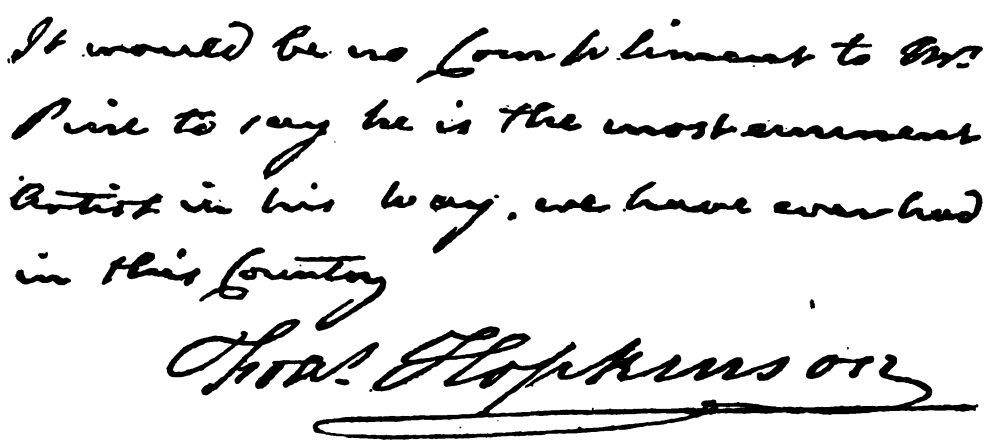
"General Clinton is at New York, in the *Mercury*, of twenty-six guns, bound to Hampton, in Virginia, with three transports of 200 light troops, there to join seven regiments from England, and from thence proceed to North Carolina, and in all probability to Cape Fear, as they go upon Governor Martin's requisition."

Mr. Hooper recommended measures to prevent the pilots convoying the British ships, securing the passes, etc., having a good military organization and large bodies placed along the sea-coast. "My first wish," he said, "is to be free, my second to be reconciled to Great Britain. God grant that both may soon take place.....May you stand forth like men to fight the cause of liberty, the cause of the living God!"

The plans of Martin, the royal Governor, and of Sir Henry Clinton for subduing North Carolina were frustrated by the success of the patriots in a battle on Moore's Creek, in that State, three weeks after the above letter was written. The Tories were subdued, Governor Martin fled to a British ship, and a marauding party under Cornwallis that landed on the shore of the Cape Fear River were glad to escape whole to their ships from the wrath of the aroused Carolinians. Sir Henry went on down the coast to Charleston Harbor, where he attempted to assist Admiral Sir Peter Parker in an attack upon Fort Moultrie.

However I shall willingly submit my Case to the Freemen of the Colony, and being fully assured that if their Experience of my past Services doth not recommend me to their Favor Nothing I can say will do it.



Step. Hopkins

STEPHEN HOPKINS.

With a trembling hand Stephen Hopkins, of Rhode Island, signed his name to the Declaration. It appeared in unfavorable contrast with the bold signature of President Hancock and the steadiness of those of his compeers. But it was not tremulousness caused by fear. No man ever had a stouter heart than Stephen Hopkins. It was the result of infirmity. He was then nearly seventy years of age, and for a long time had suffered from a nervous affection then called "shaking palsy," which compelled him to employ an amanuensis, and when he signed his name he steadied his right hand with his left. His usual style of writing and his signature are seen in the fac-simile here given, taken from a public letter written eighteen years before he signed the Declaration.

Rhode Island never produced, before nor since, a more useful man than Stephen Hopkins. Self-taught, and bred a farmer, he rose through every grade of office from town-clerk, when he was twenty-five years of age, to Governor of his State, when in his prime. He was for a large portion of his life a chief surveyor in the province, and a leading merchant; a Chief Justice of the Court of Common Pleas and the Supreme Court of Rhode Island, and a trusted leader in politics. For a long time he was engaged in a party contest with Samuel Ward, of great fierceness at times, which was, so far as can be discovered, grounded upon no real principle. They were rival candidates for the chief magistracy (to which Hopkins was first elected in 1756), and were alternately successful. It was during the canvass in 1758, when Hopkins was re-elected, that his public letter above alluded to was written. It was in the form of observations on a pamphlet issued by Mr. Ward, in which Hopkins states that his words had been tortured and misrepresented, so that his enemies had taken advantage of misrepresentation to injure him, after (he says) he had served the colony in almost every office in their gift for almost thirty years. He speaks of a "strange forwardness of so young a man as Mr. Ward [then thirty-three years of age], without knowledge or experience in the affairs of government, to endeavor to place himself at the head of things, and still more strange to attempt to render himself qualified for so high a post only by blasting another man's reputation, without displaying any ability for governing or any other amiable quality in himself." To heal these dissensions, after serving as Governor for several years, Mr. Hopkins retired to private life; and when circumstances united patriotic men he and Samuel Ward entered the Continental Congress as colleagues. Mr. Hopkins died in 1785, in the seventy-ninth year of his age.

FRANCIS HOPKINSON.

Witty and wise—a poet, musician, artist, scientist, and statesman—was Francis Hopkinson, of Philadelphia, grandson of the Bishop of Worcester, who, in the thirty-ninth year of his age, signed the Declaration. He was the first pupil who entered the College of Philadelphia (now University of Pennsylvania) at its opening, and it was always proud of him. On returning from England in 1768, and marrying the accomplished Ann Borden, he launched upon the sea of politics as a firm and zealous patriot. He was in Congress long enough to make his name immortal, when he entered upon a judicial career, which only ended with his life, in 1791.

Mr. Hopkinson was a patron and friend of musicians and painters. In the spring of 1785 (April 19) he wrote a letter to Washington (now before me) strongly recommending Robert Edge Pine, an English portrait painter, who was then in Philadelphia. He speaks of him as one whose "zeal for the American cause brought him over from England to secure, while it is yet possible, faithful representations of some of the interesting events of the late war—not ideal pictures, but real portraits of the persons and places concerned.

"You will easily discover," Mr. Hopkinson proceeded to write, "the tendency of this letter and of Mr. Pine's visit. Scenes wherein you have borne a conspicuous part can not be *faithfully* represented if you are omitted. I know you have already suffered much persecution under the painter's pencil, and verily believe that you would rather fight a battle on a great occasion than sit for a picture, because there is life and vigor in *Fortitude*, and *Patience* is but a dull virtue. I would not insinuate that you have not much patience, but am very sure that you have a great deal of good nature.

"It would be no compliment to Mr. Pine to say he is the most eminent artist, in his way, we have ever had in this country. But his own pencil will display his abilities in much better terms than my pen, and I have no doubt but you will find him worthy of your notice in every respect."

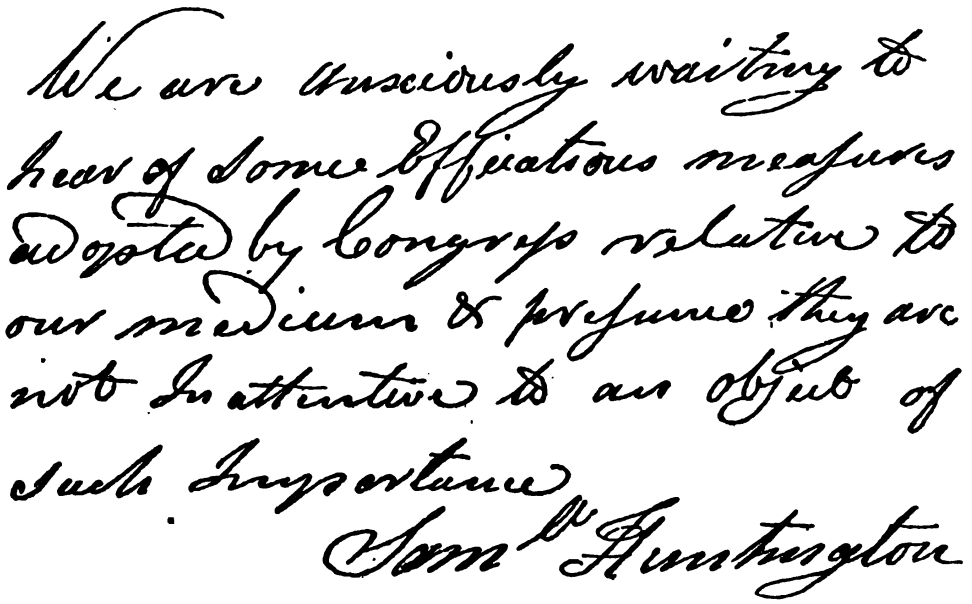
Mr. Pine proceeded to Mount Vernon, and there painted the portrait of Washington which I saw at the home of Mr. John Hare Powell, in West Philadelphia, twenty years ago. Hopkinson's letter drew from Washington, in response, that pleasant epistle which was published in fac-simile fifty years ago, and which, under date of May 16, 1785, begins:

"'In for a penny, in for a pound,' is an old adage." He continued: "I am so hackneyed to the touches of the painter's pencil that I am *now* altogether at their beck, and sit like Patience on a monument while they are delineating the lines of my face.

"It is a proof among many others of what habit and custom can effect. At first I was as impatient at the request, and as restive under the operation, as the colt is of the saddle. The next time I submitted very reluctantly, but with less flouncing. Next, no dray moves more readily to the thill than I do to the painter's chair. It may easily be conceived, therefore, that I yielded a ready obedience to your request and to the views of Mr. Pine."

SAMUEL HUNTINGTON.

The eldest son of his parents, Samuel Huntington, a native of Windham, Connecticut, was destined for the quiet avocation of a farmer, to which his father was devoted. But with his years grew aspirations for more active life. His early education was very limited, but by the force of genius and self-culture he acquired a good knowledge of Latin and general learning, which fitted him for the study of law. After abandoning farming and learning the cooper's trade, he studied law, and entered upon its practice in Norwich. He began his public life at the age of twenty-nine (1764), as a member of the General Assembly. He took his seat in Congress early in 1776. Wise, sagacious, faithful, he was chosen president of that body in 1779, and left that high position on account of ill health in 1781, when he resumed his seat upon the bench of the Superior Court, to which he had been elevated in 1774. He was again in Congress in 1783, and was afterward Chief Justice, Lieutenant-Governor, and Governor of the State of Connecticut.



The only letter in the collection before me written by Mr. Huntington is dated at Nor-

wich on the 23d of December, 1783, written to President Laurens, and introducing Captain William Hubbard. To the introduction he added:

"We are anxiously waiting to hear of some efficacious measures adopted by Congress relative to our [circulating] medium, and presume they are not inattentive to an object of such importance."

The finances were then in a wretched state. The Continental bills had become worthless. There was a heavy public debt, and no co-operative action among the several States could be obtained for sustaining the public credit. Wise men saw clearly, at that early period, that the Confederation, as a national government, was a failure.

We are anxiously waiting to
hear of some efficatious measures
adopted by Congress relative to
our medium & presume they are
not inattentive to an object of
such Importance
Sam[l] Huntington

HELIOTROPE.

HELIOTROPE, Flower of the Sun, Flower of the Wedded,
So purple and sweet by my side,
Now are the days, midsummer days, longed for yet dreaded,
When Love is no longer a bride;
No longer a bride, Heliotrope, but a deep-seeing wife;
No longer a queen, Heliotrope, but a heart-slave for life,
No longer a bud, Heliotrope, but a full-blooming flower—
Nothing to wish for better than Now, the rich Present's rich hour.

Flower of the Sun, down in thy heart, gentle and tender,
Oh, art thou not proud of thy lot?
Rose in her red, lily in white, tulip in splendor,
Thou seest, and enviest not.
All purple thy robe, mystical hue that denoteth crowned love;
No tremor is thine; well dost thou know bright Apollo above;
Firm fixed is thy life; changes are past; and forever till death
Thou dreamest in love, livest in love, in the Present's warm breath.

Heliotrope, look in mine eyes. I am thy sister;
I worship, flower-sister, my Sun.
Care I for wealth, rubies' red fire, diamonds' glister,
The films by the lace-makers spun!
They flutter in vain, ghost-lily maids, as they cross my sweet path;
They hold up their gems, summer-rose girls, and shed sparkles in wrath
Athwart my still life, trying to see what the charm is, and how
All of their future, all of their past, can not equal my Now.

Flower of the Sun, well do we know, know it together,
Our secret, our secret so sweet:
Sing we our song in the July's midsummer weather
As we lie at Apollo's feet.
Great is thy Sun-God up in the sky, and he calls thee his own;
Great is my Life-God here on the earth, and he loves me alone;
Great is our heart-bliss—all my dull words in its ardor consume:
Breathe, then, our story, Heliotrope, in thy silent perfume.

THE REV. GABRIEL M'MURRAY'S CONVERSION.

JUST as the last artistic touch was being given to the ministerial toilet, Mr. M'Murray senior entered his son's room. A glow of placid fondness, of fatherly pride, of partial wonderment at the luxuries about him, lent a deeper color to the old gentleman's round and rubicund face; and sinking into one of the inviting easy-chairs, he sighed unctuously, gazing the while beamingly upon the tall, dignified form before the pier-glass, wondering if that indeed could be his little Gaby—his apple-cheeked, lustrous-eyed, mischievous little Gaby! Could it be possible this was the sturdy little urchin that climbed into the hay-loft, scared the setting hens from their nests, and came home triumphantly with the half-hatched eggs in his hat; that fell into the mill-pond, and was miraculously saved by dear old Rover; that tumbled time and again from horses, from wagons, from swinging gates and high trees; that came happily through measles and whooping-cough and fevers of many forms, and reached man's estate, outliving his sisters and brothers and all these perils, becoming the only son of his father, and he a widower!

No wonder the boy was spoiled. One look at his father's face, every line of it betokening, as it did, an unbounded affection lavished upon this only son. And it so happened that the lad was possessed of unusual ability, that he carried off the honors at college, and so excelled in every branch of knowledge that it was difficult to make a choice of a profession for him.

His father had long cherished a pet scheme for his aggrandizement. For many years he had brooded over it, adding to its excellences here and there, until it seemed to Mr. M'Murray that this was the only sphere which was suited to the exalted abilities of his well-beloved Gabriel.

But, as the lad grew older, it became evident that he must judge for himself—that it was not possible for this innocent or ignorant father to lay plans for his gifted son. Better for him to remain silent as to his own wishes, and accept those of the boy who had in these few years so far outstripped him in wisdom. So when Gabriel came home, with all his blushing honors thick upon him, his father devoured him with loving, tearful eyes, but said no word of that dearest wish of his heart about the future.

In calm and happy tranquillity his holidays glided on, the young Gabriel transfigured beyond recognition. No more the merry, laughing, romping boy, but the pale, thoughtful student, walking with bowed head and clasped hands by the side of the streams through which he had kicked and splashed barefooted long ago, under the trees from whose high branches he had tumbled safely.

Walking thus one summer evening, he was joined by his father, the two saying little, but keeping a most eloquent silence. At last Gabriel, drawing his father's hand through his arm (for he was now by far the tallest of the two), and keeping it firmly in his grasp, said, quietly,

"It is time, father, to think about the future. Can you tell me what you have determined upon?"

"Determined upon, Gaby!" repeated Mr. M'Murray; "I—I don't quite understand you."

"What profession have you chosen for me, father?"

Mr. M'Murray took out his red silk handkerchief and wiped the perspiration from his forehead. A sudden tremor beset him. Should he whisper that which he so ardently desired?

"I have thought," continued Gabriel, "that the pursuit of law would have many excellent attributes very desirable in their way. I might then aspire to be a statesman, father."

There he stopped, for the hand of his father began to tremble in his own, and looking down, he saw something in his face that puzzled and perturbed him.

They had wandered on, and were nearing the little church on the hill, the pale light of evening shining with a yellow radiance through the scraggy fir-trees that only half hid the white tombstones in the little churchyard.

Suddenly seeing that light that seemed to come from heaven, and remembering all the hopes and joys that were buried behind that row of fir-trees—thinking of the day, now perhaps close at hand, when he should lie there too—it seemed to the old man that he must speak, that whatever there was of gain for this well-beloved son of his could only be found in this one calling.

"Oh, my son," he said, and stood quite still, his hands shaking, his voice trembling, "life is so short and so uncertain! I can't bear that it should all end here! Be something that will give you a chance hereafter. Gaby, if it should be that all is as it is written, your time would be quite thrown away on any thing but the service of God. Gaby, my son, you are so wise and strong, He is the only one fit for you to serve!"

"Theology!" murmured his son.

"Call it by what name you will, Gaby, but get it right!" said his father. "I couldn't bear that you should be any thing but a Methodist—if they put religion into any other shape, they make it Greek to me; and although you may know that language well, I'm too old to begin to learn it now."

Then they turned their steps homeward—Gabriel leaving his father at the door and

walking away with swift strides in the direction of the village.

When he reached the little cluster of white houses that began the village street he paused a moment, and looked up at a sign that jutted out over a long, rambling building: the sign bore the name of "John Martin, Carpenter," written in heavy, sturdy characters, without much regard to flourish or symmetry. Gabriel, dextrously avoiding a loose pile of boards that loomed up before him, and another that blocked the way at his side, entered a narrow pathway between, that led to a little porch so covered by a luxuriant hop-vine that the slight form of a young girl paring potatoes on the doorstep was quite concealed.

She started when she saw Gabriel, and would have had time to retreat with her potatoes, but something seemed to make her forget altogether the exigencies of the moment. Usually she was well prepared when Gabriel was coming. Her muslin was well starched and marvelously ironed; not a lock of her brown hair but was safely secured by a plain ribbon, and the whitest of handkerchiefs concealed the prettiest shoulders in Sharpsville. But the day had been so hot, and the children had tumbled her hair and her kerchief, so that the one was off, and the other hung half tangled over her shoulders. She had plenty of time to get away, but it would have been a thousand pities; for as she stood blushing there, surprised and startled, one foot prepared to flee and the other determined to linger, she was the prettiest picture that ever was framed by a hop-vine.

Many and many a time, as the Rev. Gabriel roamed over the earth, and walked the weary length of many a picture-gallery, finding emblazoned with all the art of a scientific age the divine pictures of the old masters—many a time has an odd thought come into his head that he had once seen a picture, years ago indeed, but still fresh in his memory, of a young girl with some kind of a luxuriant vine like a frame about her. Where was that picture, and what was it about? Then it would all flash upon him that it was no picture, but a living and beautiful presence, with which it was better not just then to burden his fancy; and up would go the glasses again—for the Reverend Gabriel's eyes were by this time weakened by study—and on would pace the weary feet; but in spite of all, the reverend gentleman, for that day at least, found his art researches very flat and stale and unprofitable indeed.

But to return to this summer evening, long ago, when Ruth lingered, despite her gingham gown and tumbled hair; when this sudden meeting sent a flood of light to her eyes and color to her cheeks—and indeed a faint flush had crept into Gabriel's pale face, and whatever of feeling it was possible to gather about his heart had come at the call of this little maiden. He bade her put by her potatoes, and run in for her sun-bonnet, that she might take a walk with him in the gloaming.

"A pretty piece of business!" said her thrifty mother; "to leave the potatoes half pared, and supper not ready, and your father comin' in from the shop, tired and cross as a bear with a sore head, and go off trapesin' about, gettin' fever and ager, at this time of the year, with the dew a-fallin', with Gabriel M'Murray, that's that changed that his own mother wouldn't know him if she got out of her grave on purpose. He's that proud and set up with book-larnin' that it's fit to make a fool of him; and his father 'll see the day yet he'll be sorry for it. But, law sakes! don't stand there till your father comes: go, if you're goin'!"

All which incoherency meant that Mrs. Martin would have been glad to have had Gabriel to her liking in some ways; but she had also her own ambitions about her daughter, who was generally conceded to be the prettiest girl in her native village.

"I thought it expedient, dear Ruth," began Gabriel, in his slow, measured tones, while Ruth's heart and pulse went beating with blissful velocity, quite losing hearing of the words he was saying, so absorbed was she with his nearness and dearness. This beautiful bit of joy, so unexpectedly gained, quite changed and hallowed this summer night. She thought it would have been squandered in preparing supper and washing dishes, in making the bread and sprinkling the clothes, and putting the little ones to bed and then going sordidly to sleep herself; and now, oh joy! to be thus with Gabriel, hand in hand, walking through the sweet dewy fields, all the balmy fragrant air of night given to them alone. "And when father expressed his desire," continued Gabriel, "that I should devote myself to the study of theology, I could but acquiesce; for, dear Ruth, I am under great obligations to my father. Without his aspirations for the development of whatever talent I possess, I could have achieved nothing."

"And his voice," said the heart of dear little Ruth, "so rich and sonorous; his eyes, that glow like the stars in heaven; his slender hand, that encircles my chubby brown fingers; and oh! the beautiful, beautiful words that roll out of his mouth like the pearls and diamonds in the fairy tale!"

"Therefore I have chosen to be a minister of the Gospel," concluded Gabriel; and Ruth awoke with a start from her dream of rapture.

"A minister!" said Ruth—"a real minister!"

"A veritable doctor of divinity," replied Gabriel, looking down upon her upturned face, all aglow with that wild, sweet rapture;

and suddenly he found the night was unusually soft and delightsome, and the passing moments fair. As if by magic the great infinite sky bent over him lovingly; the dewy sweetness of the wild flowers was exhaled for him; the hum of the insects, the sighing of the summer wind, were a part of that beautiful world to which he belonged—he and this maiden by his side, fairest, most sweet of all!

Warmly he pressed the little brown fingers.

"Dear little Ruth," he said, for the first time speaking the language that she could fully understand, "remember me, and when I am gone, still give me your love and sympathy!"

"Always, always," whispered the poor little girl. And then they went back silently to Ruth's home in the village. Why was it that, finding that language they both understood, he should have lost it so soon?

Mrs. Martin would have liked it much better than the long-syllabled words with which he chose to bid her adieu.

"I'll have to get that old dictionary down from the garret when Gabriel M'Murray comes," she said, afterward, to her husband, "for every word of his is as long as the moral law, and it's bin a good spell since I went to school."

"He's a pretty smart young man," said the village carpenter, "and I shouldn't wonder if he'd make his mark. His father's spent a good bit of money on his iddication, and a man likes to hev the worth of his money."

Looking at the matter in this practical light, Mr. M'Murray did really have the benefit of his outlay, for Gabriel, once having determined upon his course in life, did not hesitate to throw his whole soul into making that course honorable and distinguished. He was barely thirty when his father entered his room that February morning, and yet he had traveled far and wide, had present charge of the most fashionable church of his persuasion in the city, and by his unwonted power and eloquence had made his name famous.

The father looked upon his son, and wondered why he was thus particular in tying that simple bow of white ribbon about his neck. If, indeed, it were one of the long swathes of linen that composed the neckcloth of the clergyman at Sharpsville, then he might with reason take considerable time to make the folds lie properly; but this little foolish strip of white—why should his son care how it was tied? His coat was almost like a priest's gown, so distinct was it from an ordinary street garment. The cuffs that fell over his long slim hands were cleverly devised to show their shapeliness, and many a thoughtful moment was disposed upon the studied carelessness of the luxuriant mass of hair that adorned his noble head, and fell down about his neck.

"I am thus particular in the service of my Master, dear father," he said, by way of reply to the interrogation he found in his father's face, "to show my reverence and devotion. As, when I enter your presence, I endeavor to wear that which is befitting, and do that which is suited to your age and relationship to me, thus do I strive, all unworthily perhaps, to do honor to Him who is above all, highest and best."

"H'm!" said his father. "Certainly—quite right!" and, sighing a little, he got out of his easy-chair, and followed his son to the carriage that stood in waiting at the door, for the church was at some distance from the Reverend Gabriel's boarding-house, and he required all the rest that was possible through the arduous duties of the day. Finding his son indisposed for conversation, and feeling that a severe solemnity sat upon his noble features, the old gentleman bethought himself that it was perhaps better to get in a proper frame of mind, and put away all thoughts but those suited to the Sabbath.

He had come up to the city on a farewell visit to his son, who was about finishing his pastoral duties at St. Mark's, and would spend the following year in a tour in Holy Land. As the season of the year was inclement, and the journey long and dangerous, the old gentleman's thoughts had wandered a little, and his heart been filled by the hopes and fears natural to the occasion; but now it really did behoove him to get in a proper frame of mind, for his son sat with closed eyes opposite him, and all the church-bells were ringing out their peals of exhortation and invitation. Mr. M'Murray resolved that for this one day he would give himself up to the pleasures of the church. He would enjoy the sermon, he would join in the hymns, he would take every bit of it to his heart and revel in it. He was getting old, and heaven ought to be near and dear to him.

When they got to the church the old gentleman was prepared for the most active devotion, and his bald head glistened with the violent rubbings he had administered with his red silk handkerchief—a sure sign that Mr. M'Murray was very much in earnest. Suddenly losing sight of his son, who went into the edifice by a side door, Mr. M'Murray was given into the hands of an elderly portly gentleman, who led him well up the aisle, and surrendered to him, out of respect to the pastor, his own capacious pew.

Mr. M'Murray looked about him, and found it difficult to believe this was a Methodist church—he was almost tempted to believe he had strayed into the fearful precincts delivered over to the Romanists. This pretentious architecture, this aristocratic lo-

cality, this sumptuous interior, these cushioned seats, so gorgeously upholstered, so comfortably reclining, so tempting for a snooze! Then how did they manage that dim and religious light that fell tenderly upon the time-worn complexion of the spinster yonder?

Looking up at the windows, he saw that the garish light of the sun was pleasantly filtered through elaborately stained devices upon the glass. He could not decipher the allegories thus represented in the brightest of colors, but over each figure in the devices he found there was a large round radiance, painted a bright yellow, and diffusing this singular tawny light throughout the church. He looked in vain for the time-honored pulpit, his eyes wandering aimlessly for the spot from whence the minister was to hold forth. There was a broad platform, adorned here and there with a carved writing-desk upon very high legs, an embroidered coat of arms on a velvet cushion, and a chaste group of hot-house flowers, in a curious glass vase. A large cross was suspended from the back of the platform, a smaller one at each side, and around and about, on the hymn-books, the Bibles, the book-marks, were still smaller crosses. Immediately in front of him upon the platform was a long low lounge covered with crimson velvet. Could that have any thing to do with the pulpit?

Suddenly the organ began the first low, trembling notes of the voluntary. The old gentleman started, and grasped his hymn-book. But who was to give out the hymn? His son hadn't emerged yet from the side door. Ah, here he was! What a dignified, slow step had Gaby! What a fine figure he was upon the platform! Now would be seen the substitute for the pulpit—not the crimson velvet lounge, surely. Yet his son walked slowly to it, reclined upon it, almost, in fact, lay upon it, covered his face with his white, slim hand, and remained in statuesque quietude.

The old gentleman waited a long while, and watched his son intently, but there was movement neither of a finger nor a hair. Wonderful how Gaby could be so still! When he was a little shaver he used to kick the rounds off the chairs, punch the bottoms out, and never a whole knee in his little breeches! How still he was! how very still!

The old gentleman took out his red silk handkerchief and wiped his forehead, wondering when the organ would cease shaking and trembling, and thinking fondly of the bass-viol in the village choir.

At last the organ ceased, and now there was heard the single voice of a woman. Surely, thought Mr. M'Murray, this is the beginning of the hymn. But no—the voice went on; couldn't make out the words, but the song was certainly monstrous fine in its way—notes very high, wonderfully high; there wasn't a voice in Sharpsville could get up to that last note. But why *don't* the choir join in, and where *does* the tune begin? While he was wondering the lady ceased, and suddenly all heads were bowed in prayer.

Mr. M'Murray, thankful that he at last had secured some tangible clew to the services, put down his head comfortably, and thanked God that he had lived to see this hour; to find his son, his Gaby, the head and front of this display; to feel that at last he had touched the highest pinnacle of his ambition. Then he listened to the impressive words that fell measured and slow upon his ear. Smoothly modulated, faultlessly rhetorical, carefully fervid. Mr. M'Murray sighed a little when it was finished, he couldn't tell why.

But now at last he had fallen upon something satisfactory. The hymn is given out, the dear old hymn; how beautiful it sounds!

"Jerusalem, my happy home!
Name ever dear to me!"

The old gentleman grasps his hymn-book firmly, wipes his forehead, his head, his neck, with his red handkerchief, plants himself firmly on his feet, runs the scale under his voice—do, re, mi, fa, sol, la, si, do. How well it is, after all, that he learned to sing in his youth, and how kind in Gaby to pick out his favorite hymn, one that he knew so well, and was so fond of—the dear boy! Well, God be thanked, his voice is still lusty and strong!

But here! there is some mistake. That isn't the air—not at all. And yet there is a little note like it—and there! Why, it must be—no, it isn't. Alas! poor Mr. M'Murray was led a will-o'-the-wisp chase after that hymn that he will never forget. Not that it was possible to catch a word of it—he could never be brought to believe that the choir used any sensible words in singing—but the air itself was the catchpenny that tormented him in its pursuit. Now would come a familiar strain to his ear, and just as he was preparing to take advantage of it, away it would float again into an indistinguishable mass of variations, and become lost to him.

At the end of the first verse the organ undertook the task of keeping hope from quite expiring until the hymn was finished, and thundered out a whole line in unmistakably familiar notes. Mr. M'Murray took heart again, began to even blame himself for being old and stupid, resolving that the second verse should not be a failure.

But, alas! the second verse betrayed no consanguinity whatever with its predecessor, for whereas that commenced very low, this one began very high—so high that every body's voice but the soprano's exhausted itself in an ignominious squeak. The quar-

tet choir was left in possession of the field. Mr. M'Murray sank into his seat, exhausted, flushed, and out of temper. He found presently that all the congregation were upon their feet again, repeating something in reply to a psalm that his son was reading, but as it seemed to him that they spoke in a foreign language, and he had never ventured out of his native tongue, he remained silent and sad. It appeared, after all, that he was not to partake of these religious joys—they were far above his grasp. He wished himself heartily at home in Sharpsville.

And the sermon of his son, which was delivered without the aid of a pulpit at all, though a delight to his pride, was a mortification to his understanding. Like the hymn, here and there a passage familiar and sweet, then suddenly lifted out of the reach of his comprehension; abounding in brilliant metaphors, felicitous similes, and overflowing with poetical quotations.

"I'm sorry you're so much given to rhyme, Gaby," said the old gentleman, on their way home.

"Don't you think I'm old enough to be called Gabriel, father?" said the young divine, with something like petulance in his voice. This pet name of his father's had grated on him for years, and now, when all others had crowded around to congratulate, when he could scarcely escape the tide of adulation that overwhelmed him, here was this old man, his father, withholding from him the meed of praise that had become necessary to him, and persisting in calling him by an absurd and childish name.

"Eh? Yes!" replied the old man, a grim sarcasm lighting up his eyes. "I beg your pardon, Gabriel; I've been used to it since you were a boy, you see, and it takes time to pick up these new ways."

"I beg of you, father," said his son, quickly, "to forgive my foolish preference. Call me by what title you will. I confess to the weakness of being disappointed that you had no word of praise for my church. It is the most tasteful edifice in the city. Every one admires St. Mark's."

"Why St. Mark's?" said the old man. "Why not St. John, or St. Jude?"

Gabriel hesitated a moment. There was a shrewd speculation in his father's eye that forbade any thing but a straightforward reply.

"The title, father, is merely a type of signification," he said, "and thus it became natural to associate with it a familiar and honored name. Mr. Mark Britton has devoted the largest part of his fortune to the cause of religion. He is a most accomplished, worthy, excellent gentleman, and almost built St. Mark's—"

"And you canonized him," broke in the old gentleman. "Was that he that supported that poor demented creature upon his arm?"

"Demented creature! There is some mistake, father. Miss Genevieve was with her father this morning."

"If it was the man you introduced to me as Mr. Britton, he certainly had a person with him that would have been better away. Her bonnet was all mashed in at the brim, and her hair fell over her eyes like the mane of a wild beast. I'm not particular, Gabriel, but the person having her in charge ought to have smoothed her hair, and made her decent for the house of God!"

"The fashion is a little absurd just now," said his son, with a smile; "but a young lady in Miss Genevieve's position must comply with its decrees."

"God save me and mine from its temptations!" said the old man, fervently. "I thought she was a little touched in her mind, or I'd have had no patience with her. When she wasn't yawning, or half asleep, she was staring at people through her glass. I thought of Ruth Martin, the carpenter's daughter, at Sharpsville. I suppose you've forgotten her; but I wish you could see her as she sits with the singers at home. Folks say she's almost an old maid now, but there's few young maids like her. Our parson's words are simple and plain, but she listens prettily, and the color comes into her cheek and fades out of it again; the tears and smiles chase each other out of her eyes; she sings like an angel in paradise; her hair is nicely smoothed under her bonnet; and she walks like a young gazelle. God bless her, and keep her from the snares of fashion!"

"Amen!" said Gabriel, a shade passing over his face. "I do remember her well, father. You say she has not married?"

"Not because she hasn't had the chance," said the old man. "There isn't a young man in the place but would have given his eyes for her. Her father's got a goodish bit of money laid by. She'd be a pretty match even in that way; but she belongs to the village, Gabriel—to every one that's in deep waters. It's a treat to hear her read the holy words. Your aunt Barbara's deaf as a post, but she can hear Ruth when she speaks quite low. God knows it's a joy to see the child come in. The house is very lonely, Gabriel. Your aunt is powerful deaf."

"We must get her a new ear-trumpet, father," said Gabriel, starting out of his reverie.

"There's no trumpet but the archangel Gabriel's will do her any good now," said his father. "I'd rather plow a field than ask her what's o'clock. We are getting old, Gabriel, Barbara and I."

Then Gabriel fell into his reverie again, and very little more was said between him and his father until their parting words next day.

"When you get through with your travels, Gabriel," said his father, as they parted,

"when you feel like settling down a bit, I want you to come home and stay by me for a time, and help me make my peace with God."

"Surely, father, that is already accomplished."

"Is it so easy, then, think you?" said the old man. "I don't find it so, my son. I never have found it easy. I thought when I gave you for a preacher it would be all right, but it hasn't served to bring me closer—not a whit, Gabriel."

Gabriel pressed his father's hand. An unwonted emotion shone in his face. A resolve shaped itself in his heart, but ere it found utterance the old gentleman was gone, and the tidal wave of ambition swept all away but those new and glowing delights that glittered before him.

But on the waves of the ocean, or under the calm clear brightness of the Syrian sky, among the marble tombs and the mulberries, in the burning desert, and amidst the olives and vines and pomegranates that grow on the heights above Galilee, he was haunted by those last words of his father. Every Jew that he found sitting in proud resignation, inspired with the desolation of a vain hope for that Messiah that tarried so long, he likened to his father, so old and so lonely, waiting for his son. Something in the graceful veiled faces of the Easterns brought back to him that vision of Ruth as his father had painted her. He could not keep that song of Solomon's from escaping his lips:

"A garden inclosed is my sister, my spouse;
A spring shut up, a fountain sealed.
Thy plants are an orchard of pomegranates,
With pleasant fruits; camphire, with spikenard,....
With all trees of frankincense."

In the mean time old Mr. M'Murray read to Ruth the letters of his son, and lamented his long sojourn in foreign lands.

"He's given up to the foolishness of fashion, Ruth, quite as much as the poor young woman I told you about. Heaven knows but he'll marry her before they come back, for you see by his letter the canonized gentleman and his family are also abroad. What with the hump on her back and the hair hanging over her eyes, the very camels 'll think she's mocking them. I wouldn't blame them for lying down upon her—flowers, feathers, and all!"

A half-suppressed sigh escaped from the lips of Ruth, but she laughed also at the funny conceit of the old gentleman.

"She'll charm the camels as she does every thing and every body," said Ruth, who had heard a great deal of Miss Genevieve Britton.

"She'll never charm me," said Mr. M'Murray. "I'll have none of her!"

At the close of the summer Aunt Barbara died, and the shock was a great one to her brother.

"I'm quite alone, you see," he said, appealing to those about him.

He fell into a low melancholy, and sat for hours looking into the fire that Ruth had caused to be built thus early to cheer him. She knew that he longed for his son, although he scarcely ever uttered his name now, and the letters from abroad fell listlessly from his hand.

One night he called out bitterly from his sleep, "Gaby, Gaby!" And Ruth arose, and putting a shawl about her, seated herself at the table, and wrote thus to Gabriel M'Murray:

"DEAR MR. M'MURRAY,—Your father is very feeble; he longs for you sorely. If it be possible to shorten your journey somewhat and come home, it will be better for both him and yourself.

"Your old friend, RUTH MARTIN."

Her hand trembled as she put down the old-fashioned quill. It was better to have him come home, even if a place had to be made fine enough for Miss Genevieve's flowers and feathers. Surely she would be kind to the poor old man; her woman's heart would teach him to love her; it would not be for long; he was failing fast; before spring he would be at rest—a rest so sweet that one was tempted to envy it.

Her tears fell heavy and fast on the old mahogany table. She brushed them away hastily, but ever they would come and fall.

"I am a wicked creature," she said at last. "I have so many and so much to live for, it is cowardly to wish to be at rest, however happily."

And when she went back to bed she found, upon taking an inventory of the happiness that remained to her, in spite of Miss Genevieve and her charms, that it was not inconsiderable.

"One must not be a baby," she said, "and cry for the moon."

When this great luminary, the moon, got Ruth's letter it cut him to the core. He was at Beyrout, and it is a long way from Beyrout to Sharpsville.

"My father will be dead and buried!" he cried, bitterly, and almost cursed the delightsome land about him. He fell upon his knees to plead that the dear life might be spared to him; but suddenly he found no utterance to the thoughts that swelled his heart to bursting. Where now were those smoothly modulated, eloquent appeals, those three-syllabled words, that had always come so glibly to his tongue? Not one of them would serve his purpose now. He paced the weary strip of sand in silent agony till the time came that he could mount and ride for home.

"Home!" he repeated to himself, and thought of all that word meant, of what it could contain, and of what, alas! it had left for him: a dead father, unconsoled in his last hours by religion or love of kindred; a

neglected, ungratefully abandoned love, for surely Ruth *had* loved him once. He urged the panting beast onward. Oh, for time—time to atone for the past!

At Sharpsville the neighbors all, finding that Mr. M'Murray had at last taken to his bed, sent him the good old parson; but the sick man turned his face to the wall.

"I have a preacher in my own family," he said, with the old gleam in his eye. "He's a great man among the clergy, and could almost talk a bird off a bush. Surely I'm entitled to his services now."

"But he's so far away, and does not know of your illness," said the good minister.

"That's his look-out," said the sick man. "It was a bargain between us that he should be with me when I came to die. I'm sorry for him and me."

And that was all that could be gained from the poor old man. Even Ruth was not allowed to pray with him. He loved her well, and refused food or medicine from any hand but hers, but said, always with the old sarcastic strength and vigor,

"I am waiting for my son, the Rev. Gabriel M'Murray. He is at present traveling in Palestine, but will perhaps get home in time."

And as the days went by he became weaker and weaker, began to ramble a little at times, and the hand that Ruth held in hers was sadly bloodless and thin.

Ruth declared to herself that she would be glad to fall upon the neck of Genevieve Britton if she only brought with her this recreant son. One wild November night they thought he was dying. He lay quite still, his eyes closed, his pulse scarcely perceptible. Ruth's grief turned itself to Gabriel now. It was not, then, reserved for him to see his father—this father whom she knew he so dearly loved.

He opened his eyes and looked upon her, a sad smile shaping itself upon his lips.

"It is too late," he said, faintly, "is it not? We have both been in fault, Ruth. Tell him I forgive him." He closed his eyes and remained silent for a time, then opened them again. "Tell him I forgive him, and *bless* him," he said, and paused. "There is a hymn, Ruth, the last I tried to sing; but it was spoiled for me, dear. The woman's voice was very high. I doubt if you could get the pitch — 'Jerusalem, my happy home.' I never could remember it since. It's a pity to rob a poor sinner of a good Christian hymn."

Ruth began to sing, her voice full of tears, but beautiful, very beautiful. It soared out into the cold night, and was borne away upon the wind to the ears of a man who, drenched with rain, chilled with cold, half paralyzed with fear and dread, could scarcely keep his seat upon his horse, until that voice reached him and cheered him on.

"O God," he cried, "be merciful to me and mine!"

Then suddenly, in the midst of the hymn, a step, staggering and faint, fell upon the old man's ear, and, starting up in bed, his eyes strained with a terrible joy, his lips tried to utter a name, and his arms, outstretched, reached for the poor mortal to whom God had given the joy of gaining father and home at last.

"Father, I have sinned against Heaven and against thee," cried the poor prodigal, "and am no more worthy to be called thy son."

The old man fell back upon his bed—but not to die. He began to mend, and to this day, for aught I know to the contrary, sits out on the old porch with a troop of rosy grandchildren about his knee.

I don't think they belong to the Britton family, for although their maternal grandmother is given to boasting of her son-in-law, the bishop, it must be owned that her husband is only the carpenter at Sharpsville.

The Reverend Gabriel, although a bishop and a very great man, can put his clothes in a valise, and dates his conversion from the day he got that letter at Beyrout from Ruth Martin.

ON A PICTURE OF THE MATER DOLOROSA.

He said, Too sad, too sad,
Too hopeless-sweet the veiled and drooping head;
Too mournful is the mourning for her dead:
Too sad, too sad, he said.

He said, Too sad, too sad.
He had forgotten that no Easter dawn
Before the rising of that solemn morn
Had solaced Love, forlorn.

Too sad, he said, too sad.
O woman-heart! I think he did not know
How womanhood shrinks only from the blow
That lays her Worshiped low.

And so he said, Too sad,
Forgetting night is dread, and darkness deep,
And all our lives are hidden in their keep
When our Beloved sleep.

But still he said, Too sad;
Too deep a meaning in its patient gloom
To gild the edges of a happy room,
Like things of light and bloom.

I said at last, O friend!
No walls so happy that they may not hold
Some heart whose idyl is the story old
Those drooping eyelids fold.

THE REPUBLICAN MOVEMENT IN EUROPE.

By EMILIO CASTELAR.

[Seventh Paper.]

III.—THE GERMANIC PEOPLES.

THE German race fills the most special ministry in modern society, as a race which has carried in its own spirit and brought into daily life the sentiment of individuality, effaced in the ancient states. Many writers think and say that this division into races is fundamentally false, and injurious in its consequences to the idea of human unity. Nevertheless, a conscientious study of history proves that either by conquest or by political influences, or other relations between peoples and the regions they occupy—relations as intimate as those between the body and the soul of every man—tribes and nations draw near each other, mingle, and form one race, just as families approach and mingle to form a people, to compose a true nationality. And thus, as it is no contradiction to the unity of nature that there should be planets and satellites, worlds and suns, it is no contradiction to the unity of the human race that there should be individuals, families, tribes, and races. The natural medium in which they move affects the color of their skin, the size of their eyes, the degree of their facial angle; and the society in which they grow up affects their conscience, their intellect, and moral life.

There is nothing so closely connected with the spirit as speech. Many philosophers have confounded the idea with the expression of it, and have proclaimed the impossibility of the most secret and intimate thoughts without the aid of language. Christian theology has called the Second Person of its Trinity the God-Man, the Word; and the revelation of ideas, which is for our souls what heat is for our life, has been the eternal revelation of Speech. Human speech is, therefore, the most intellectual and the most spiritual of all our natural functions, and speech is diversified not according to nationalities, but according to race. What strict kinship there is between the Portuguese, the Italian, the Spanish, and the French! It might be said that all of the Latins are born knowing these four languages. With a little reading, a little practice, we attain to their complete possession. And why? Because the four dialects are immediately derived from that mother-tongue which has given its name to our race—the Latin language. In the most remote antiquity are unerring proofs of this. While the speech of the pagan peoples—the progressive, artistic Indo-European peoples—has rounded periods, complicated syntax, a verb rich in tenses and moods, which enable it to subordinate secondary thoughts to the capital thought, subsidiary phrases to the predominant and the sovereign phrase, the religious Semitic peoples, born to diffuse monotheism, reared in the solitude of the desert, the authors of that music which appears like the sob of the soul, and of an architecture which reserves all its marvels for the interior—the speech of these peoples is triliteral in its roots, simple in its syntax, suiting the sense to the sound in its words, cut up into versicles united by the primitive medium of the conjunction—all differences of the highest importance from that rich variety of Greek and Latin, the two languages formed to contain and to express the variety of human thought.

The Indo-European languages have these characteristics because they are the languages of those peoples who have passed through all political ideas and social forms; who have produced gods in their image; who have placed the direction of their states in the hands of legislators, tribunes, heroes; who have written the analysis of Aristotle, the synthesis of Plato; who have consumed innumerable philosophical ideas in the perpetual movement, the periodical renovation of their spirit—while the Semitic tongues are the languages of religious peoples, who have founded the idea of the unity of God in Jerusalem and in Mecca; who have resolved almost all their forms of government into a pure theocracy; who have been directed by the voice of prophets; who have written the Koran and the Bible; who opposed to the Greek chorus the melancholy hymn; to the drama, subjective and lyric poetry; to free thought, the perpetual commentary of their revelations; to the gods of mythology and the God-Man of the Gospel, their one Creator, secluded as in a secret tabernacle in the immensity of the heavens.

If two fundamental races have filled ancient history and the ancient world, two fundamental races fill the modern world and modern history—that is to say, the Latin and the German races. The latter has always borne with it the idea of individuality, and has opposed this undying individuality, caught from the very bosom of nature, to the absorbing forces, to the institutions—means of civilization in certain historical periods, but always repressive—of the Helleno-Latin race, more artistic, more humane, if you please, than the German races, but less apt to preserve its entire liberty, and to hear in daily life the call of its own conscience.

It is an irrevocable law of history that the German races should destroy the great uni-

ties reared by the Helleno-Latin races—those great unities beneath whose weight human personality disappears, and with it the law of liberty in life. The famous writers of antiquity announced, with the prophetic power of their genius, the destiny confided to the Germanic races at the close of those states of society. When Lucian described in imperishable verse the ruin of liberty at Pharsalia, he did not see that it became extinguished. He saw it pass the Rhine, take refuge with the primitive and ancient tribes known as Germans. Tacitus, the conscience, the remorse of the ancient society—Tacitus, who heated his steel red-hot in the fire of the love of liberty, to plunge it like a dagger into the heart of tyrants—opposes to the work of Cæsarism the work of nature; to the despotic empire the federation of tribes; to the magistracy imposed by Pretorian slaves the magistracy elected by freemen; to the corrupted court of the emperors the loving family, the respect for women, the purity of morals, acquired in the inspirations of conscience and the exercise of liberty.

Cæsar, on whose brow appeared to have been condensed all the genius of Rome, trembled before this immense mystery which was called the German world, and wished to inclose it in his empire. And in these distant forests and plains, in the sleep of primitive life, in their blind intercourse with nature, the Germans felt their wrath against the Eternal City rise like a hot wind. "I do not go of my own will to Rome," exclaimed Alaric in his raids; "I feel that something superior to me pushes me on, drags me forward, without giving me rest, and forces me imperiously to sack Rome." Genseric unfurled the sails of his ship to the wind, not knowing where he was going. The pilot asked him, "Lord, where are we going?" "To seek those peoples against whom the wrath of God is aroused;" and they went to Rome. What was it which these barbarians hated most in Rome? It was the principle hostile to their principle, the ideal contrary to theirs. They hated the omnipotent power, the absorbing authority, the Cæsarism, which denied the very root of life, our personality. And from that time, whenever the Latin world has arrived, by the impulse of its character, by the work of its federation, at one of those political or social states which reproduce the Roman empire, the Germanic race has always come to re-establish the principle of individuality. Thus, as the hordes of Alaric and Genseric, born in the forest, educated in the shock of battle, without any home but their war-car, without any patrimony but their arms, rushed to devastate Rome because it was the centre of imperial and Cæsarist unity, the descendants of these hordes fulfill in the Middle Ages, in the Renaissance, and in modern times the same ministry they accomplished at the end of ancient history. If the French people, apostatizing from Germanic principles, re-establish the empire under Charlemagne, other tribes, other European families of the same origin, scourged by the sword of the Normans, found modern individualism in the feudal chaos. When the popes seized the control of consciences, and organized by their theocracy a strong government and universal authority proceeding from Rome, the German empire and its most illustrious representative, the house of Suabia, contested this religious unity with political and civil opposition, and prevented in the West a disastrous copy of the Oriental tyranny of Byzantium, founded by a coalition of the patriarch and the emperor. In the sixteenth century the Emperor Charles V., on one side, with his immense domains, and the artistic popes on the other, with their immense *prestige*, saved the Church from schism, dissolved the councils which threatened the power of the Church, reduced Ghent to submission, decapitated municipal freedom in Villalar and the brotherhoods in Valentia, who threatened the power of the empire. When two powers of such force on earth as the power of Charles V., who found a new world in the seas, and the power of Leo X., who found an ancient world among the ruins, threatened to restore Cæsarism, there arose to hinder it, to deprive the pontificate of its *prestige* and the empire of its peace, the obscure monk Luther, who, collecting all the anger of his race, from the blasphemies of the drunken peasant to the prayer of angels in ecstasy, sacked the Rome of religion with the same wrath with which Alaric and Genseric had sacked, a thousand years before, the Rome of the Cæsars. The power of Philip II. suffocated Protestantism; but a German by race, a Hollander by birth, named Orange, threw down the colossus which covered Europe with its shadow. If the policy of Louis XIV., in the following century, engendered another gigantic Catholic reaction, as well in conscience as in courts, another Orange, also a German by race and a Hollander by birth, raised the Protestant individualized religion to the throne in England. If the kings in the middle of the eighteenth century established their absolute authority, despoiling even the Church of its attributes, the Germanic races, or their Saxon family, shook these absolute powers with the proclamation of the republic, and the advent of democracy in America. If, in the triumph of revolutionary principles in 1793, and their new triumph in 1848, the Cæsarist reaction, initiated first by the Cæsar of our time, and by his descendant the new Augustus, founded on imperial authority, the Germans Wellington and Blücher at Waterloo, and Von Moltke and Bismarck at Sedan, destroyed these empires; and elevated anew the idea of human individuality, which is

like the bone and the marrow of all our liberties.

We must not demand of the German races that in the European republican movements they should adopt in advance of the Latin races the organization of the republic. This organism will always be the work of the artistic and inspired race—the race which, the moment it has conceived the idea, has always put it into practice, anxious to create and to produce a complete realization of its ideas. But the German race has kept this individualist idea, this intimate sentiment of personal independence, which really constitutes the dignity without which republics are impossible. These ideas, these sentiments, are, as it were, the matter of which the republic is the form. In the immense nebula composed by this diffusion of the human spirit democracy is formed, as Laplace says the sun and the planets are formed in the infinite nebula of which we are part. The glory of the German race, in view of modern revolution, has consisted in procuring us a rational knowledge of that idea of right which we had felt, and had almost implanted in reality, before they gave us that clear and distinct knowledge of it. For another most intimate characteristic—I will not say of the race, but of the German nation—is the predominance in it of the scientific sentiment, of self-acting free thought over the practical sense, over the thought of policy. The Germans have accomplished their revolutions more in conscience than in space. Their most formidable insurrections have been those of the spirit. Certainly they have not, like us, reared the guillotine for their kings; nor have they, like us, laid the demolishing axe at the base of their temples; nor have they, in the present century, hanged their feudal lords to the lamp-posts, as the French hanged their nobles and the Spaniards their friars. We are still awaiting the formidable revolution announced by Heine, by the side of which the French revolution is to appear an idyl. The Germans can not justly aspire to the title of revolutionists. But in the intellectual sphere, in the heaven of ideas, in philosophy and the arts, what profound revolutions, what audacious dethronements, have they accomplished! The gods and the kings, the sacerdotal and aristocratic castes, the fundamental dogmas of the religions of the Middle Ages and of the monarchical traditions, all have been decomposed and consumed in the burning crucible of their criticism. To investigate, therefore, the part which the Germans have taken in this modern political revolution, at the termination of which we are to meet the republic organized in the united states of Europe, we shall find that it is necessary to study science more than history, the course of ideas more than the course of events. Far away in the infinite and tranquil heaven of modern thought, where our low tempests never arrive, the bolt was forged which was destined to strike down the religious, philosophical, and political standard which was the true origin of hereditary and permanent powers. This revolution is less visible than political ones, because it is less bloody; but it is more efficacious, more fruitful in results, even than violent revolutions whose shock appalls us; for this invisible, impalpable electricity of ideas excites the material revolution, and raises that storm of conscience which gives life and vitality to events.

Is it true that peoples can not possess universality of aptitudes? Can it be true that those most expert in the abstractions of science fail when they descend to the reality of politics? We are tempted to believe this, studying the scientific and political movements in Germany. Their audacity is without limit when it is necessary to affect moral powers and abstract ideas; their philosophers approach the starry throne of the God of history and tradition with the froth of demagogic rage on their lips and the axe of the regicide headsman in their hands. At the blows of their implacable logic superstition falls with a noise more tumultuous than that of revolutions. Hernan Cortéz, with all his adventurous genius and all his epic valor and Spanish faith, never attacked the idols of conquered Mexico as the humble and timid philosopher of Germany has attacked with scientific formulas the God of his fellow-citizens. All our outbreaks in the public streets, our barrack insurrections, all our revolutionary movements, which gave out such thunder of electricity, never contained the essence nor the quantities of revolution contained in those apparently obscure and idealistic discourses, foreign to reality, pronounced by the German doctor, seated behind his lofty desk as on a vague and remote cloud. To them, to those German masters of philosophy, we owe that theory of right before which the ideas of Rousseau appear conservative and reactionary; to them we owe that theory of progress by whose impulse all institutions, even those most trusted for their celestial origin, and those most destined to eternity by the public powers, have fallen in the idealistic movement of human ideas, and have submitted to the law of universal transformation which condemns all resistance to liberty to sure defeat, and reaction to inevitable death. The universe and God, the soul and the body, nature and the spirit, have been called to the tribunal of their philosophy; kings and popes, the castes of priests and warriors, to the tribunal of their history. No tribune ever directed such imprecations against the pride of tyrants as they against the authority of the monarchy and the church. No revolution ever freed society of monsters with the

power which they have employed to free the conscience from sophisms. But these demi-gods of the earth, the sovereigns of thought, the judges of institutions, when they descend to common life have seen their most sacred rights at the mercy of the first groom of one of these kings or kinglets, the relics of the Middle Ages, the *ignes fatui* in the grave-yard of history, who lately reigned, and who in some little states still reign, over the feudal soil of old Germany.

The Germans have been compared to the ancient Indian, absorbed in contemplations of the world and of himself, and giving to other peoples his ideas and his gods. They have been compared also with the Greeks of the time after Alexander, not that they possessed the written and oral eloquence which is the property of the Greeks of all time—as if the Hellenic spirit could never be touched by decadence; not that they possessed that relief of form and of expression which gives life and blood and flesh to the most abstruse thoughts; but they resembled the Greeks in their dotage, because, like these, they think, write, speak, teach, and transform the conscience, give themselves up to ideas, and do not perceive that by their side, over their shoulders, is rising a military and autocratic empire which, from one encroachment of tyranny to another, may end in bringing about the physical and moral degeneracy of ancient Byzantium. The Latin peoples, who are always so swift in the realization of their ideas, have scarcely ever enjoyed liberty of thought. The Germanic peoples, who have possessed liberty of thought, have scarcely experienced the living desire of realizing their thought. And the idea which never touches reality, which does not convert itself into a heart and soul distributed among the people, which breaks no chains, which destroys no gallows, secluded in the summits of pure reason, is like a god without providence, shut up in the solitude of his inaccessible essence, without communication either with the spirit or with nature. No one admires Germany as I do. Its metaphysics are the touch-stone of our thought; its poetry responds better than any other to the vague idealism of our spirits; the art of Germany may be called the philosophy of the heart; its music, impenetrable at the first hearing, appears when you have learned it the voice of nature, the harmony of uncreated ideas, the anticipation of the spiritualism of heaven. I pardon the German writers their confusion of style and the philosophical obscurity of their thoughts, because I understand that only in this way can the individualism characteristic of their nature be preserved. I admire their patient investigations, their religious worship of science, all the enlightenment which Germans have given to the modern spirit; but we who love progress have a right to make some complaint, some bitter reproaches, to the German people. If that people, described in such a masterly manner by Tacitus, with all their aptitudes for liberty; despising gold, because they were ignorant of the necessities which gold satisfies; united in assemblies where the leading men treated of details, and the whole people of general results; governed more by example than authority, more by persuasion than by force; enjoying the privilege of electing their chiefs, and disposed to follow them every where through a sense of duty; chaste worshipers of woman, on whose brow they discerned the signals of prophecy, and in whose beauty they saw the divine ministry of the priesthood; secluded in their homes with their families and their children, who were nourished at no other breast than the maternal; devoted to their personal independence to the point of enthusiasm, and savagely hostile to tyranny—if that people through so many ages have preserved any thing of the primitive virtues, as they have preceded all modern peoples in proclaiming free conscience, they ought also to precede them in establishing the federation and the republic.

But let us not be materialists. The idea, even when it appears most vague and most abstruse, nourishes the conscience, and so is filtered into reality. When we lose ourselves in scientific abstractions, we do not remember that those abstractions, like the Divine Word, must become incarnate in substance, and in the form of the human race. The traveler lost on the Alps, among the eternal snows, where he can scarcely breathe, where he perceives no atom of life on the desert of ice, does not easily remember that there below, in the deepest valley, all that cold and immobility and desolation becomes the Rhine and the Ticino and the Rhone, spreading the life and joy of fertility among the fields of Italy and of France and of Germany. The idea is the soul; the idea is the life: events do no more than copy ideas, and that imperfectly and rudely. The whole course of social events is filled with ideas, which are like hydrogen in water and oxygen in the air. Fifteen slow centuries were required to form a society animated by a progressive idea. Let us not care for delays. Time is a relative idea. The delay will be long if it is compared with our short lives; brief, if compared with the life of humanity. No one can calculate the millions of ages which have been necessary to form and compose the planet on which we are embarked. Who can divine the time that it will require for an idea to fall from the mind of a thinker upon his school, to pass from the investigation of the school to the militant forces of the apostolate, thence to the crucible of martyrdom, from there to the conscience of

a party, and from the conscience of a party to the laws, and thence to the customs? But we have no right to doubt of the virtue and the efficacy of ideas, after having seen them issue from the lips, more subtile than the air on which they were carried, melting at one flash the bayonets of armies and the crowns of kings. Let us study this movement of ideas in Germany, sure of finding the revolutions to which a response has been made and will be made in events.

The true representative of the philosophical revolution in Germany is, by common consent, Kant, founder of the school of criticism. The eighteenth century would have been false to its progressive spirit and to its destiny if, while it destroyed historical institutions in society, it had not destroyed also traditional ideas in the conscience. Every society which renews itself must renew its spirit, and with its spirit the ideas on which the soul of a generation finds its nourishment, and the organization of powers is formed. The eighteenth century could not promulgate natural rights without understanding human nature, without investigating the human problem *par excellence*, the problem of knowledge. To solve this problem nothing was more necessary than to trace the limits of our intelligence, to say how far it could arrive by the power of reason; and in solving this problem the knot of the difficulty is found in the relations between the objective and the subjective. "Let us not attempt to know things in themselves," exclaimed Kant; "let us distinguish in all knowledge between that which is furnished by experience and that which proceeds from our own being." No external phenomenon happens for us without happening in time, which may be extended to eternity, or diminished to an inappreciable and imperceptible instant. Time has not entered into our mind, nor has space, by the senses. Time and space are laws of sensibility. Knowledge would be most imperfect if we acquired solely sensations, if we possessed merely the faculty of feeling. It is the most primitive, and, in the hierarchy of our faculties, the most rudimentary; that which assimilates us to the lowest animals in the zoological scale. If we had no sensations of life and of the universe, we would take our appetites as a rule of conduct, and the fleeting impressions of things as the laws of the universe. Our morality would reduce itself to the laws of pleasure. Our science would resolve itself at last into an immense heap of facts—of objects completely distorted. Phenomena, and not their laws, would be the sole foundation of our knowledge. Sensation is purified and transfigured in intelligence, which is the faculty of notions, the active faculty of knowledge, by virtue of which we determine and define the objects presented by pure sensibility. Sensations or intuitions remain without light and without life, dead bodies in the mind, if they are not elevated to the rank of notions; and notions would be shadowy and lifeless if they were not connected with objects. Thus, as the science which treats of sensibility is called Æsthetics, the science which treats of understanding is called Logic. Intuition is sensibility in exercise—the object impressed upon the subject. The notion is the conception of the subject in regard to the object. As sensibility can not be separated from time and from space, understanding can not go outside of those principal categories—quantity, quality, and relation or manner. These elements of judgment are forms of intelligence. But notions are not enough for knowledge. To perfect it, reason is necessary, which gives universality to judgments, which places them outside of all conditions, which elevates them to ideas—that is to say, to universal principles in the purest region of the infinite. But, precisely because reason exercises this sublime ministry in life, it is necessary to guard against transcendental illusions. By transcendental illusions Kant means useless efforts to pass the limits of our intelligence. By such efforts we waste our reason in senseless ambitions, and we people our own souls with shadows. The labor we should employ in learning the possible we waste in traversing the impossible. We should renounce as illusory the thought of understanding in its essence the immaterial nature of our souls. And as with the idea of the soul, so with the idea of God, which it is in a still higher degree impossible for human reason to demonstrate. Apart from certain arbitrary forms of nomenclature, arranged solely to sustain the rhythm of ideas and the architecture of the system, the *Critique of Pure Reason* is the most lucid and most minute analysis of the limits of the forces of our reason which has been attempted since the time of Aristotle. It was absolutely required by the human reason to enable it to avoid useless investigations, and to confine itself within the sphere of the possible. With it and through it remains concluded and finished that theological period which had brought the human race from the sophisms of the monastic schools to the violences of religious wars—to fight and to die for vain abstractions.

Man not only thinks, he lives; he not only has intelligence, but will. Principles, to which pure reason can not attain by mere logic, appear when we require to found and establish moral laws. At this point arises the necessity of liberty to create human life, and the necessity of the immortality of the soul for the complete realization of justice. In the light of these principles is developed the purest moral law—the law of complete disinterestedness, the law of the love of good

and the hatred of evil for their own sake, without which neither the fear of punishment will save us from vice, nor the satisfaction of conscience or the hope of reward lead us to virtue, but only the inner motive, independent of every other mandate, except the categorical command of our own conscience. In virtue of this moral law man should proceed on principles which shall raise each of his isolated individual actions into universal rules of life and of conduct.

Although the principles overthrown by pure reason and restored in practical reason may appear contradictory, they are not so, if we take notice that the thesis of the philosopher reduces itself to setting natural limits to certain investigation, demonstrating that the existence of God, the liberty, spirituality, and immortality of the soul, are affirmed with greater force than is possible to pure metaphysics, when it is shown that without these principles morality could not be established in life nor right be founded on the face of the earth.

But the philosopher who thus scrutinizes the limits of intelligence, the laws of morality, ought to enter into the sphere of politics. Intrenched within his own thought and his own spirit; analyzing his own conscience and reason more than exterior objects; without passion, but also without discouragements; knowing nothing of life but its serene and regular course; never broadening his nature in the delights of the family; face to face with the human soul and conscience, like God in face of the universal creation—it is useless to seek from him observations upon facts or conceptions of reality. Seek, and this you will receive—ideas holding relations with philosophy and the moral sense, pure ideas of right. The origin of right was always the most important of questions. He who causes, engenders, originates law, is the true sovereign. For this reason the thesis of the theological schools claims that law, being the emanation of God, should be defined and applied by a true theocracy. Among the ancient peoples, the Greeks and Romans, law was the emanation of the state; under Cæsarism it was the will of the prince; in feudal times it came from the possession or conquest of territory; in modern times it came from traditions of God, whose image on earth was represented by the kings; for Rousseau, the revolutionary prophet, it came from the will of the people; for Kant, the law originated in human nature, which is its immutable foundation. The definition of the philosopher may be criticised. It may be said that the enumeration of conditions indispensable to assure personal liberty and harmonize it with the liberty of others has a certain vagueness, and is liable to the reproach of formalism and superficiality. But in that critical hour of history it was necessary to vindicate two principles—human nature as the origin of law, human liberty as the soul of law. Both principles were vindicated by the sublime thought of the philosopher, both principles which were to produce a moral revolution in the conscience and prepare another political revolution in human society.

The capital object of his doctrine was to direct the world by ideas, and found a science of politics through the sovereignty of reason. To direct the world by ideas, he did not, like Plato, ask power for philosophers, but he asked for liberty and freedom of thought. To arrive at the reign of reason, after combating regicide and the right of insurrections as Machiavelian doctrines, mindful only of success, he united and coordinated policy with morals, the principles of positive justice with the eternal principles of justice.

Thus, in a world still drowsy with the unquiet sleep of the Middle Ages; beneath the weight of absolutism; to the sound of the rack, which still disjointed the bones of prisoners; amidst the rumor of armies which still oppressed men, and wars which still devastated the earth; in the midst of German feudalism, alive in spite of the revolution which lightened and did not shine—Kant writes, with a heart devoted to love of humanity, and a thought devoted to the mysteries of the future, a profound treatise, which prepares the advent of liberty, and which substitutes for conquest and force the pacific relations of right.

To attain these great ends, Kant proposes that treaties of peace shall be adjusted with the intention and purpose to avoid new wars; that no independent people should be subjected by violence and conquest; that permanent armies should disappear; that states should respectively abstain from interference with the government of other autonomous states; that civil right as well as political right should recognize another superior right which touches humanity at large, and which can and should call itself the essentially cosmopolitan right.

The savage state, which is praised by the Utopians as the natural state, is in reality a state of war. The Indian carries through the forests in his nomadic life the envenomed arrow, not only against beings of other species, which he may kill for his profit or defense, but also against other tribes which dispute with him the air, the soil, or the chase. Political states are founded to assure peace, and to attain in the sanctity of law a firmer security against violence than force can afford. To return to war after having entered into civil life is to stumble anew into the savage state.

But the great philosopher recognized that the relations of people among themselves are not enough to avoid war and establish peace; that an interior organization com-

pletely pacific is necessary. And this entire organization can be no other than one capable of assuring the rights of all, and distinguishing the orbit and the various faculties of the public powers. The civil and political constitution of every state should be a republican constitution. Writing under an absolute monarchy, Kant timidly defines republican government as that where the executive and the legislative powers are found divided; and as this may happen, and does happen, even in a monarchy, some attribute to Kant, comparing these texts of his with others of his *Public Law*, the intention of referring to constitutional monarchy. Such a belief is confirmed by his confounding in another place pure democracy with pure absolutism. But clear, concrete explanations leave no occasion for doubt. Kant desires a republic, because with the republic all the citizens have the right of peace and war, and it is most improbable, when this right resides in the entire body of the people, that it should throw itself into the abyss of war. Suicide, like madness, is an exception, not a general law, in human society. Next, if individual rights are derived from nature, the public powers should be derived from a pact, and the government which can be founded on a pact is no other than republicanism, and must be formed not of vassals and subjects, whose lives can be disposed of without their consent, but of true free citizens. They call such a government as that a government of angels, supposing that human weakness is not able to comprehend it in its purity, nor practice it in its full extent. But this alone is true human government, because it recognizes the principle of liberty, which is the need of every man, and because it establishes a common legislation in harmony with that idea of natural equality so profoundly engraven on our conscience.

It is thus that the immortal philosopher not only sustains republican government for the purpose of human culture and perpetual peace, but he sustains also the federation of republics, the federation which is the great mechanism of free societies, which distributes power among high political personalities, and then concentrates it in a supreme unity. Thus autonomous states, by means of changeable pacts, may go on establishing a system of government where authority is contained in law and restrained by law, as liberty is contained in right and measured by right. The privileges of men and the interests which originate in these privileges may oppose themselves with sometimes irresistible force to the relations of this idea, but the nature of the earth and the character of the communications between peoples, the nature of man and the necessity which all men have to join in bonds of common laws, give assurance that the internal indication of individuals and the superior human education, the work of scientific and social progress, must found each state on a republic internally, and all states for the purposes of external relations in federations, which shall constitute, as it were, a new humanity on the earth. The liberal revolution was arriving in this supreme moment to the fullness of life through the knowledge of itself. The solitary celibate philosopher, with no other divinity than his idea, which completely possessed him, was impelling the world with forces slower but surer than the material ones. Human nature studied in its profoundest depths, the idea of right defined and made concrete in its most necessary phases, the republican régime proclaimed as the most fitting for cultivated peoples, universal federation recognized as the organization of justice and of right, perpetual peace promised as a result and consequence of all these ideas, were giving to the modern revolution an ideal which in part has been already realized, and which will soon be realized in its fullness. And these formulas were not those of an ambitious politician, of an ardent tribune, of an impatient conventional, who hurled them into the midst of war or revolution to rouse his party or his people. No; they were conceived in retirement and in silence, thought out in complete independence of any personal interests, and diffused only in the worship of the truth, to hasten the reign of justice, without any other motive than the purest, almost mystical, love of the human race, and no other reward than the satisfaction of conscience. The republican ideal was thus formulated in the heart of thinking Germany.

Two men were renewing the policy of the eighteenth century—Kant and Rousseau—two men of incalculable moral power. Kant was the philosopher, and Rousseau the artist. Kant agitated the conscience of man, and Rousseau his sensibility. Kant engendered those progressive ideas which transform the spirit, and Rousseau those exalted passions which transform events. The life of the one was tranquil and orderly as his mathematical formulas; the life of the other tempestuous as the revolution. The soul of the philosopher exerted itself to strike, like the rising sun, the heights of science; the soul of the artist, like the tempestuous cloud, to reach the social depths, the heart of the masses. Kant defines the natural right which produces the free man, and Rousseau the political pact which produces the republican state. One is the true author of individual sovereignty, the other the true author of popular sovereignty. Both represent, in these two systems, the thought and action, the principle and the life, the spirit and the organism, the soul and the body, of these modern revolutions, which, conceived in the

lofty regions of metaphysics, and diffused by the divine word of art, have at last to produce the United States of Europe, raised from the blood-stained abysses of the monarchy and of war to the pure life of the federation and the republic.

The critical philosophy necessarily had its natural consequences. The idea of human personality recognized in all its extent, exalted with all its attributes, intoxicated with its own substance, in the restlessness of its young life, in the ambition of its passions, came to deny every existence and every reality which was not its own. The heavens appeared to its eyes as a figment of the soul, like the web which the spider weaves, or the pod spun by the silk-worm.

The material universe disappeared in the intoxication of the human personality. Light was the reflex of our own ethical spirit; the stars condensations of our innumerable ideas; created beings were all organisms formed of the logical series of emancipated reason. In the immense cloud of dust raised by so many falling ruins, nothing was plainly visible but our own overmastering individuality, bearing its conscience on its brow as the sun of suns. And nothing else was to have been expected. Every new idea tends to absolutism, to the annihilation of limits, to the suppression of opposition, to the belief that it is enough to fill the universe and to resolve all problems. After criticism has pushed aside all that there is of internal and all that there is of external in knowledge, the dialectic necessity demanded that the spirit should come to believe the universal life its proper substance, the light its own reflection, and the universe its work. It is, therefore, necessary to gauge philosophical systems—first in themselves, in their fundamental principles, independent of every historic moment; but afterward in their strict relation to the time in which they arise, and with the totality of philosophy which they develop under one of its phases. The slave, the serf, the vassal, was becoming a man in the revolution which equally touched society and the conscience. To arrive at these results it was necessary to raise his personality into absolute independence of every accident; to place his right above all right. Kings had made themselves divine. In opposition to kings, the free man must make himself divine, anoint himself with the oil of his absolute personal autonomy. This was a necessary moment in the succession of time, and a logical principle in the series of ideas. The metaphysics of liberty went to extremes, erroneous, perhaps, in themselves, but necessary for the emancipation of the human spirit at large. To deny whatever was opposed to individuality was audacious, but without this audacity victory never comes to an idea. Progress proceeds through radical and absolute opposition. Religion denies all rational philosophy, and philosophy all revealed religion. The physiologist eliminates the spirit and the mystic matter. In the pantheism of the preceding century there was nothing but one being with two forms—extension and thought. Human individuality disappeared in this ocean of the universal substance. Liberty was reduced to the mechanical force of the universe. To break this great tyranny of pantheism Fichte constructed in his system man, his individuality, his personality, and declared him the only real being, gave him the earth for a footstool, the universe for a temple, where all things were successive modifications of our own substance.

Fichte personifies this moment of time, this phase of the spirit. For him there is a science which is, in respect to metaphysics, the same as metaphysics in respect to common-sense, the science of sciences. This science requires a first principle, inaccessible to negation, indubitable, self-evident. This first principle could be no other than the principle "I am." Here is the sovereign affirmation, the basis of all judgment, the incontestable foundation of all science, the first principle of every system, the thesis where doubt with its vapors can never arrive—"I am." From this sovereign affirmation, then, through thetic, antithetic, and synthetic processes, Fichte deduced the existence of something opposed to the "I;" of something which had reality solely from being distinct from "I;" but the "I" remained as the centre of all scientific spheres, as the enumerator of all real things, as the measure of all possible ideas.

A philosophy so audacious raised general contradiction in the common-sense which considered itself insulted. It is said that at the conclusion of a conference Fichte used this singular formula: "To-day we have created the world; to-morrow, gentlemen, we will create God." It is said that at a certain dinner an impudent servant of the house took away the plates from before him, saying, "Let the philosopher feed on his own substance." The ladies of Germany related that as Fichte did not believe in the existence of any personality that was not his own, he consequently could not believe in the existence of his wife, and wondered how Madame Fichte liked that. The governments were alarmed, and persecuted him in the universities. The great pagan, Goethe, censured him for the frankness with which he announced his ideas. Yet, nevertheless, Fichte was a great character as well as a great philosopher. Born in obscurity, educated in poverty which bordered upon misery, driven by the spur of necessity from free Zurich to oppressed Warsaw, without stumbling or falling by the difficulties of the way, without yielding his ideas under the lash of oppression, preferring to all ap-

plause and every advantage the religion of philosophy, loving all humanity and its progress with a love almost mystic, he lived consecrated to the work of rousing the conscience of his country, in the midst of the terrors of revolution and the disasters of war, and died, amidst the horrors of pestilence, in the service of misery and pain, a master of morals, a hero of duty, a martyr of science.

In spite of these exaggerations which have been published, of the individualism of Fichte, the immortal philosopher really held that the idea of the individual was derived from the relations of man with his kind; that, living in these relations, law was necessary as a condition indispensable to individuality. The rational being could not comprehend himself nor give himself his proper place as an individual solely, but as one of so many rational beings as existed in relation with him. Scientific, intelligent, and active, nature and society, the external world in its various manifestations, invite him to action, to operating upon them as a cause. Obedience to this invitation is the end of man—the fulfillment of his destiny. The means which are necessary to fulfill this destiny are his rights. But man needs to recognize not only his existence as a person, and his personal right, but his coexistence with other persons and his rightful relations with them. This reciprocity is fundamental in right, because without it society would disappear. Right is divided into primitive, coercive, and political. The first, primitive, is that by virtue of which man asserts the control of his own life. No foreign force should control a man in the fulfillment of his destiny, while he does not ignore or injure the rights of others. Individual activity should be directed and regulated by intelligence. Coercive right is that which has for its purpose the maintenance of the personal rights of all, and supposes a pact among citizens, and, as the consequence of this pact, the necessity of the state. Political right regulates in turn the common will and sovereignty. This common will gives laws. The executive power charges itself with their execution. The power of vigilance which Fichte proposes as a tribunate, as an ephorate joined to the executive power, charges itself to see to the execution of the laws. When those charged to execute the laws fail in their duty, those whose duty it is to watch the execution of the laws should suspend them and appeal to the people. The respect of law determines the form of government. Where the people have no idea or sentiment of legality, the form of government will necessarily be the monocracy; but where the people respect the laws, the form of government should be the republican, the only rational and just one. All these political consequences are derived immediately from the philosophy consecrated to the exaltation of the inner man, of the conscience. We bear within ourselves the ideal of justice, the sublime code of duty; and nothing is needed but the exertion of our own will for the fulfillment of this code, and with its fulfillment our happiness is realized on earth. By perfecting the individual we perfect humanity, the superior individual, for whom ages are as years, slow but sure in his progressive growth. Make the subjective laws of reason objective in every direction and through all spheres: this is the supreme destiny of humanity in history. The series of events which have happened in a certain period of time have, like a mathematical progression, a common reason in the idea which animates them. Thus in every epoch one general thought has predominated, a consequence of the preceding epoch, and a premise of the succeeding. Our time, in the midst of the eclipses of reason, in the midst of the failures of the will, has solely one purpose—to realize the notion of right. But humanity counts many ages in the continual succession of time, and it will take more than a single day to realize the plenitude of the life which will be the incarnation, the objective manifestation, of the pure law of reason in society and in the world. The capital ages of man are five. First, man, shut up in nature, like a seed in the earth, like the embryo in the womb, has nothing of life but instinct; none of the faculties in exercise but sensibility, and the universe appears to him as a living poem, phenomena and facts as miracles, law a revelation, government a divine patriarchate—the so-called age of innocence. Second, powerful external authority, engendered among the horrors of war, raises itself to a despotism, and exacts of the conscience absolute faith in its principles, in the will blind obedience to its mandates—an age properly called that of the advent of evil upon the earth, and the fall of man into sin. Third, authority is wounded by reason, which begins to possess itself and to declare itself first cause in life; the ancient principles fail; the historical gods die; altars and temples fall to ruin; indifference of general principles reigns—the age of transition. Fourth, reason arrives at maturity, right at a concrete idea; science gives laws; justice becomes sovereign—the age of the beginning of perfection. Fifth, the ideal of reason becomes completely defined; right is realized in its fullness; morality is law; art is the divine word of all philosophical principles; evil is a fleeing shadow; liberty the only means of fulfilling life; good the universal end of all beings and things; the angel of God descends invisibly from the skies, uncreated light in his eyes, a sword of fire in his hands, with divine love in his breast, to drive sin from the earth, and to restore it

completely to the pristine immaculate purity of Eden.

Fichte's Philosophy of History gives as the purpose of life the fulfillment of the precepts of reason, and his Moral Philosophy the accomplishment of good through disinterested and pure motives of conscience; his Political Philosophy the confirmation of right in our personality, and of the republic in the state; and his Æsthetic Philosophy the divine ministry of art, which is to overthrow evil with its magic wand, and to open the heaven of reason. His entire system breaks all the fetters of the soul, and promises to our hopes, thirsting for the infinite, a pure, intelligible world, over which, like a thick veil, is spread that boundless celestial space, with all its luminous dew of suns and worlds.

But the highest of Fichte's qualities is revealed in the powerful reaction which his mind exerted against the impurity of events, against the miseries of reality. The French revolution burst out, and with it a new spirit spread through the conscience of humanity, new blood through its veins. Men of narrow discernment saw of this most important event only its disasters—the headsman forever in action, the guillotine in exercise; war in the provinces and on the frontiers; revolutionists mingled with aristocrats in the cart and under the knife; dictatorial power in the hands of that sombre, irresponsible assembly called the Convention; the crimes of the kings aggravated by the crimes of the masses. But Fichte saw rising above events the vapor of ideas. Fichte saw in the boiling lava of the eruption of to-day the fertilizer of to-morrow. Fichte saw below the inundation of blood the harvest of new and salutary principles; for he was inspired by something immutable and almost divine, the voice of reason and of conscience. Raised above the rock of his own desk, beneath the burning lightning, amidst the howl of the hurricane, the roar of the angry waves, and the drowning cry of the shipwrecked, he meets all with the persuasion fixed in his mind that the world was not lost or destroyed, but was filled with newness of life. His serene judgment is that of history. His tranquil idea mounts to the skies, and bathes itself in the dawn of the future, while the mass of men are groveling in the shadows. He had profoundly investigated the human spirit, and had seen how it arrives, by virtue of new ideas, to the full knowledge of its right. And for this reason, while the course of events was running with turbulent current through space, the course of ideas, moving serenely through his soul, was full of tranquillity and light, superior to the weaknesses and errors of the time, as if—its marriage with the body being broken—it dwelt already in the limpid regions of eternity.

While all Germany was exclaiming against the revolution, Fichte studied and judged it. To appreciate it, he presented two problems, which refer, first, to the legitimacy of the revolution; second, to its prudence. The means employed by the revolution were more or less just, more or less conducive to the vindication of right. But no one could place its legitimacy in question, because no one could with justice deny to peoples their right to change their political constitution. If this change brings evils, to whom could they be imputed? It is difficult, almost impossible, to prevent people habituated to the darkness of the dungeon from dividing themselves into irreconcilable parties, and, being so divided, even after their emancipation, from throwing in each other's faces, in continual combat, the broken fragments of the ancient fetters.

Under these considerations, Fichte turned with anger upon those who wished the world to be directed solely by the force of tradition, and human knowledge by the criterion of experience, as if there did not exist in reason pure laws anterior to all times, and principles beneath whose influence all arbitrary or unjust authority vanishes. If man had no other book than that of history, if because he yesterday fell into slavery he must continue the slavery to-morrow, and if time has a power to justify that which conscience eternally declares unjust, let us renounce our nature; let us demand some moral suicide which can annihilate the soul; let us leave off all work and effort for good; let us declare ourselves eternal children, always learning and never creating, deprived of all original faculty and power, and destined to repeat past ages perpetually, and continually imitate past generations. The historic school says, to justify our oppression, that only in history can man be known: a grave error. The accidental of human life, the state, the beliefs of a day or of an age, the fleeting institution, are learned in history. But the essential, the eternal, human nature in its fundamental laws, the typical man who does not change, who is not modified, can only be known in the science of pure reason, in philosophy, which gives us also the law of our right, and the fundamental principles of all justice.

But rational principles are impracticable, according to the empirics. Impracticable! And the history which they invoke in a matter where history has no jurisdiction—eternal right, eternal justice—they forget and neglect in a matter in which history is competent, to prove how the most abstract ideas descend from the conscience to events, and how events adjust themselves to ideas, as the coin to the die. The truth is that the immutability of social constitutions which is desired by the historical school denies and contradicts the destiny of humanity,

which is gradual and progressive perfection.

The human race, hitherto more under the control of sensibility than conscience, has been able to give greater credit to faith than to reason, and greater value to tradition than to right. Its tutors, understanding this, and making use of the backwardness to which they have contributed, ask that the tutelage be continued for the purpose of educating the race and of giving it a more convenient culture. But no education has virtue enough to elevate man—to give him personal dignity, authority over himself—except that which is inspired by its origin or its nature in free reason, and which is directed for its end and object to the security of right; which concludes by saying to the tutors of the human race what the philosopher said to the Greek conqueror when he stood in his sunshine, "Lord, move aside, for you are depriving me of the light of liberty." In spite of all justifications, the tendency of monarchies is inevitably within the state to grasp for unlimited power, and out of the state, for an empire without frontiers, universal conquest and domination.

The monarchy supposes the principle that man may be the property of another man—of the monarch. But man is his own property. As if a king had given him his rights, he has the audacity sometimes to deny them, at other times to restrain them. But it is not a king who has given his rights to man; it is nature. Neither the king nor the state itself, even the most democratic, even that which is ruled by all the citizens, can give or take away the right innate to our personality. Man is primarily a spirit, and as a spirit he has but one sovereign—reason; but one judge—conscience; but one code—the moral. But man does not live isolated in his personality; he lives also socially. Positive law is in this relation his rule of conduct. But positive law should give consecration to natural right; other men should be his judges, but in the most perfect equality. By a series of political contracts the citizen should harmonize his individual sovereignty with the sovereignty of the other individuals in the state, where the power is the expression of the general will. But in these contracts men can not alienate inalienable rights; for it is a contradiction to say that the intelligence shall not think, and that the will shall not desire. Man possesses a right to be in society the same as in nature, to be before the law the same as before the universe, a person, free and responsible.

When philosophy arrived at this point, it was its right and duty to rest, as the God of the Genesis after the creation of man. In the breast of the ancient pariah; under the skin of the slave scarred by the lash; in the ignominy of the vassals who bore the mark of their kings, the crest of their lords; in the profound humiliation of the oppressed; under all the chains and the wounds, as long as the conscience pulsated with life, there pulsated with it the free personality born of the divine forces of nature, though suppressed, effaced, by the errors of society. But when it rose boldly upon the beam of its rack, it reclaimed a law as real and harmonious as that which sustains the world with its attraction. It reclaimed as reasonable, as free, as responsible, the law of its right.

It is just to say that Fichte did not always preserve this serene conception of his own ideal, and this unshaken fidelity to his own principles. In other works, written later than the *Considerations upon the French Revolution*, he fell from extreme individualism into extreme socialism, and gave to society powers which the state could not hold without injury to liberty. This inconsistency, common to thinkers who have lived before the public in incessant relations with it, ought to cause no surprise to those who know how the vapors of events cloud the serenity of the conscience. But the life of man should not be judged by a momentary weakness, nor the work of a philosopher by an exceptional aberration. One result always remains from the whole, which is like a chemical substratum, the essential thing in the system. And the system of Fichte can be defined with clearness and exactitude, the most rigorous vindication of liberty and the fundamental rights of man. If any doubt could remain, it would be cleared away by his campaign against the historic school.

In the bosom of Germany the revolutionary battles which we Latins deliver by force of arms are fought with the weapons of ideas. The material agitation does not respond to the agitation of the conscience. Their scientific schools have the same position as militant parties with us. The notion of right is the motto which each combatant carries on his banner. The origin of right is a subject of enthusiasm and passion among these eternal students, as the passion of power among the eternally revolutionary Latins. The two hostile schools are the philosophical and the historical schools. For the philosophical school, right is a pure conception of reason, based on nature, independent of time and of place—the consecration of our spiritual and moral personality, which should subordinate political laws to the laws of its own essence. This idea naturally alarmed those who placed above every philosophical standard the criterion of experience, above all human faculties the course of time, history above all science, custom above progress, the instinct of peoples above all reason. The historical school principally accused the philosophical school of forgetting the nature

of the state in favor of the nature of man, and the living country in favor of abstract humanity. The historians of right accused the philosophers of right of want of patriotism.

An absurd accusation! None of these readers of parchments ever raised patriotism to the height where Fichte carried it, the philosopher accused as a false priest of vain metaphysical conceptions. It was due to his idea—that the country should be the origin of humanity—to his pure sentiment of moral duty, to his worship of justice, to his care for the education of the soul, to his high feeling of human dignity, anointed for all liberties, to his illuminating and vivifying spirit, in fine, that in the supreme crisis when conquest was devouring all Germany, when the conqueror was hewing in pieces the ancient holy empire lying under the feet red with German blood, when the noise of the drums and the cannons of Jena drowned every voice, there arose from the heights of a pulpit raised to the moral pinnacle of the modern world a voice of irresistible eloquence, condensing behind the clouds of blood and tears exhaled from battle-fields the immortal, stoical, vigorous conscience of the German people, sustained by a vivid faith in their right to an unconquerable hope of recovering their independence.

The ancient world presents examples of harangues more artistic, but not of greater moral power, than those pronounced in Berlin by Fichte under the sabre of Napoleon. What invocations of moral valor, what exalted vehemence of pure patriotism! How deeply he felt the fault of our time, which has divided men into men of action and men of ideas; when the word rings and cuts like a sword; when thought and art also have their heroism, as was shown by Æschylus fighting in Marathon against the Persians, and Cervantes reddening with his blood the waters of Lepanto! From these discourses, in which the idea of the country was defined in its relation with the idea of humanity; from these conceptions of right and of duty, which framed a new moral conscience in the human consciousness; from these ideas, which thundered and blasted like powder burned in battles, and which produced a new spirit capable of the greatest heroism—rose the national epopee of 1813, in which Germany showed to the world once more how every conquest breaks to pieces against the indomitable will of the people resolved upon combat to death. The accusation of the historic school toward the philosophic school was unjust. On the other hand, has not the historical school consecrated and defended all secular iniquities merely because they had in their favor the privilege of time? No notion could be falser than that right is found only in its development, in its movement, in its history. For is there not one fundamental idea of right superior to all modifications? Is it conceivable that right should reduce itself to history if there was not at least a sentiment, a conception of right, even if there were no clear notion or elevated idea of it? To a people addicted to routine, given to admiring an expression of ideas like a pleasant spectacle, but without any tendencies to reduce them to reality—to such a people the historical school presented as an ideal its usages, customs; its ancient legislation, stained with feudalism, fit only for the Middle Ages, of which the only result was to petrify it under the sceptre of its kings and the lash of its aristocracy. To the idea that the state is the only and complete social organism; to the other idea, not less false, that the public instinct is above reason; to that theory which, after having exalted the national conscience so far as to make it sacred and inviolable, delegates the preservation of right to semi-sacerdotal, privileged castes of lawyers; to that favorite predominance of historical experience over pure science; to that continual exaltation of custom, of usages, of traditional law—is due, in great part, the fact that although Germany is one of the most cultivated peoples in the world, it is still discussing the expediency of abolishing feudalism in those little states, the lost stones of the ancient castles of nobility—stones which the strong roots of the salutary vegetation of our progressive ideas have not been able to penetrate.

No: the organization of human society should not be perpetuated when it contradicts the idea, the spirit of the time, of the century, because it may be merely the product of a historic fatality. Instinct, which confounds us with the brutes, can not prevail over reason, which is the divine faculty, the faculty of the infinite. By this road we would soon come to place the animal life over the life of the spirit; the stomach over the reason; custom over justice; history over the ideal; secular tyranny, the pontificate, which has endured fifteen centuries, and monarchical power, which has endured twenty, over our natural right, which has virtually existed in us for a whole eternity. And not only our right is thus destroyed, and with it our liberty, but at the same time every principle of justice, and with it all moral sense. If only the existing law is justice, you must admit that there is justice in the sacrifice of deformed children, the abandonment of useless old people. And not only the moral sense is destroyed, but science with it, because science can not consist in a perpetual commentary upon legislation already written in different codes sanctioned by custom—legislation which changes according to the changes of time, climate, historical education, institutions, habits, and usages of various peoples, more diverse in their political and religious prej-

udices than in their degrees of latitude. Science must elevate itself to a universal law, which changes by no accident, which fails by no exception. And if the only thing worthy of being known is that which happens in the world, and not that which exists in the soul, there is no science of right possible. And if that be so, there is no hope of reform, because every amelioration proceeds from the contrast offered between the reason, which rises to pure justice, and the impurities and shadows of reality. Through these conflicts between pure reason and tradition we have passed from the age of man in which instinct dominates, to that in which intelligence rules. In these contests between pure reason and reality all the reactions and all their advocates cling to the historical school as to their safety-raft. The king, who is born with the privilege of commanding slavish hordes; the executioner, who inflicts irreparable punishments upon men; the priest, who aspires in the name of God to subject the free conscience to the yoke of dogma imposed by coercion and force; the military aristocracies, which live by war, as the hyena by slaughter and death; the feudal aristocracies, who watch as if it were a thunder-cloud the idea of right passing over the brow of their serfs—all oppressors, in fact, invoke the historical school and its sophisms to rivet anew the chains of the people and gild the diadems of despots.

Editor's Easy Chair.*

MANY years ago it was whispered about in a prominent New England city that strange things were going on at the house of a distinguished divine of the straitest pattern, that the unseemly tones of a violin had been heard to come from his study windows, and that a head and a pair of legs, which had been identified by peeping neighbors as belonging to the reverend doctor himself, were seen alternately to appear and disappear above the garden fence in such swift succession as to show that his body was in rapid revolution about a gymnastic pole. His friends of the stricter sort were greatly grieved, fearing that such worldly sports in a man of God would hurt the cause of vital religion, and they tried to stop the scandal. But the good man went on fiddling and whirling to rest and refresh himself, and as his prayers were no less fervent, and his preaching grew rather better than worse, they decided to make the best of it, while the more enlightened class of parishioners and the free-and-easy community at large thought a great deal better of him, and were glad to see such signs of humanity in a profession that had been so much in danger of drying up and mistaking ghostliness for spirituality.

We are not so strait-laced now in our way of thinking, and we are quite ready to speak well of mingling a fair allowance of play with our work. Yet we find it easier to talk play than to do it, and we are so serious in our business and our care that we are as much in danger of losing our joy in the established worship of the almighty dollar as the stern Puritans were in danger of being robbed of their smiles under the threats of their terrific theology. In fact, some keen observers and profound thinkers soberly maintain that as a race we have lost our youth and our joy; that with the gods of Greece the youth and glee of Greece have gone forever; and that we are a superannuated generation—an old set of fogies who may as well make up our minds to put our houses in order, arrange for our funerals, and die. What utter nonsense such speculation is, a little glance at nature at once will show. Our children come into the world with as full and majestic a birthright of joy as the children of the Greeks, and they are as fond of play as are the kids and lambs that frolic in the pastures, or as the birds that are stirred to song by the morning sun that has been pouring out his waves of gladness ever since God said, "Let there be light."

Take that boy of four years old as a specimen. He happens in just in the nick of time to tell us what nature is, and how badly we so often abuse and lose it. What a round of fun he goes through in an hour or so! What an odd and extensive settlement he starts at once with his box of blocks and his collection of tin men and wooden trees! What a new reading of history, both natural and social, he gives out of the contents of his Noah's ark! How he prattles and laughs as he watches the soap-bubbles that are blown from the mug by that pipe, and he sees each one swell in bulk and glisten in beauty, and then break into nothing! Delighted as he is with these playthings, he is delighted still more with having to do something that looks like work. He will help you pick strawberries, and if you do not unwisely tire him out, he will crow over a great berry as Shylock would gloat over a grand ruby; and if you ask him to shell pease with you, he will run about with his little basket full, crying out to every body for notice, "See! I have done this all myself." His body is all astir with waves of sensibility and action; his nerves and muscles are as rhythmic as the undulations of the light that fall upon his rosy cheeks; he is a music-box—nay, an organ of spontaneous melody and harmony, needing only his bread and milk to wind him up, and no hand to press his keys but the touch of the sunshine and the air. In fact, we get a more thorough knowledge of the capacities of our children from their play than from their study. When they really play, they let out the full compass and depth of their nature. Their senses are quick and earnest; their touch and sight and hearing are all alive; their perceptions are strong and clear; their calculation is sharp; their judgment is good; their intuition is bright; they look upon things and

into them; their will is eager, and their fancy is on the alert. They have more true inspiration generally when they play than when they study, and they are handsomer, more graceful, and more under the power of the mysterious and mighty spirit that moves through nature and history, and connects the conscious powers of our race with the unknown life of the universe. The best schooling will never lose sight of this fact, and it aims to cheer and exalt the plodding drill of books by the stir of action, the form and color of reality, and the free movement and loving sympathy of good companionship. It is remarkable that the best book for children is one that makes play out of work, and that Daniel De Foe is the prophetic master of all modern educators; and his *Robinson Crusoe* has become an institution in some of the Kindergarten schools, which call a regular class by this name.

This point is too important to be overlooked in our study of actual life, and in our criticism of modern culture. Play is really a very serious matter in the education of the young and in the discipline of the old; and we often show our entire ignorance of it by our boast of superior knowledge. We sometimes think that we know how to play when we have really become bankrupt in personal sport, and have made over our fun into the keeping of other people. In the East the ladies and gentlemen do not dance themselves, but they pay adepts in the business to do the dancing for them. We have not come to this in Christendom as yet, although quite a number of us are willing to look on and let the girls and boys dance away in our sight, with an expenditure of strength and perspiration more than sufficient to lay out upon the spade or the broom, the saw or the spindle. But our modern society has been trying to make its play over into the hands of professional performers; and the saying of Shakspeare, "All the world's a stage, and all the men and women merely players," ought to read, "All the world is looking at the stage, and all the men and women go to see the players." We tend to dismiss the highest action of our own powers, and to fall short of the best inspiration of our own capacities, and to make other people sing and act, laugh and cry, for us. Thus it is very doubtful whether a play-going community is of necessity a playful and happy one.

The French probably go to the theatre more than any other people, and while the government patronizes and supports the great houses, the boulevards and gardens swarm with little concert-rooms that night after night offer pretty dramas and songs and dances to all passers-by who will pay a half franc for coffee or ice-cream. Yet the French are not a very happy people, and their amusement is the art of killing the time which they, more than most others, allow to be a bore, and they do not like to spend it alone. This year closes the second hundred years since the death of Molière, their great comedian, and perhaps the greatest of all comedians. He has been making fun for the Parisians ever since 1645, when, under his original name, Jean Baptiste Poquelin, he first went upon the stage, a young man of twenty-three, just out of college. During these two centuries and a quarter of amusement under his masterly lead has Paris been made really more cheerful, and have not the Parisians depended more upon being played to than upon playing? Is their home life loving and happy, and is their literature full of genial, hearty, gladsome thought and feeling? Can they differ from each other without rancor, and when they quarrel are they willing to stop with the tingling cut of the tongue instead of resorting to the murderous cut of the guillotine? These questions answer themselves, and we fear that somehow French fun has been spoiled in the making, and since Rabelais laughed away so much of the old religion under the priest's cassock, and is said to have put on a domino when he was dying, that he might die *in Domino*, or in the Lord, like a good Christian, there has not been heart enough in French play to bring out the true genius of humanity. Luther, who was born twelve years before Rabelais, had more real glee, and he lived and wrote, and prayed and sung, under God's own sunshine, with wife and children and loving friends, not among rollicking celibates and ribald recluses, who professed one thing and practiced another, with the cross of the Crucified about their necks and the madness of Bacchus in their blood. Yet we will not despair of Rabelais, nor deny him a kindly and earnest and humane purpose in much of his fun. The buffoon's laugh, as the maniac's scream, has been assumed to protect a purpose in advance of its time.

Molière undoubtedly was, in some respects, a severe moralist, and he brought out upon the stage something of that spirit of the Reformation that was so harshly crushed out of the church. He had a great deal of truth and humanity with his sparkling wit and his genial humor. Yet he was evidently indebted for much of his motive and his vital force to the more exuberant and natural Italian comedy, with whose plays and actors he was so closely and so long associated. From them he took the old heritage of glee which is one of the traditions of our race, and which garners up the laughter and the joy of ages, just as the fossil coal beds treasure up the rays of antediluvian sunshine, and allow us to throw their flash and their fire into our chilly homes when winter comes. In fact, the whole history of the drama reveals the transmission and transformation of this comic force; and Shakspeare, a far more original and exalted genius than Molière, drew his clowns and his humorists from old precedents, ancient stores of jollity, or banks of frolic.

The Abbé Galiani gives a striking illustration of the connection between the history of comedy and the life of the people, which shows how close was the relation between the two, and how much the old Italian farce, with its set characters and their extempore gibes, drew from the streets and the fields. He says that in Acerra, a town of Campania, a company of comedians ranged the country to pick up a living by their art. One day they came into a region where the peasants were making their vintage harvest, and they soon grew quite merry together over the flowing wine, with no small conflict of ready tongues and wit. The actors made fun of the peasants, and these returned the fire with interest, until the fun was as good as a play, and it came near ending in a fracas. But among the villagers an odd fellow turned up by the name Puccio d' Aniello, with a comic face, a long nose, a swarthy tint, funny

enough otherwise, and with sharp wit. The comedians opened their battery upon him, and he returned it with grinning vengeance, until he at last drove them from the field. They finally swallowed their chagrin, and thought it best to make a good thing out of the adventure by engaging this strange character to join their troupe and to traverse the land with them. He consented, and hence the famous name Puccio d' Aniello, Polecenella, Punchinello, and finally Punch, with all his noted line of successors, ending with our distinguished contemporary, the redoubtable Mr. Punch of the London press. We incline to think, however, that his pedigree is of far older date, and that Punch and Judy have, in one form or another, been set before children either in puppets or stories or plays since men and women have laughed and cried, made love and scolded and quarreled, in this fitful drama and frequent farce that we call human life.

The time has come for looking into the philosophy of play, and for making it tell decidedly upon the science and the art of education. If we go to the root of the matter, we shall find its moving power at the very sources of life. Every thing that lives comes of a certain force which has its spontaneous play, and the play continues and is perfected according as the spontaneity is carried into all the functions of existence. Whatever we do without severe effort and without striving for a serious object is play. In play the pleasure is mainly in the act itself, and the object in view is important not for itself, but for the pleasure of seeking it. The moment that the game becomes wearisome, or the prize before the player is sought for its own value, sport ends, freedom vanishes, and business begins. Some kinds of work, indeed, border closely on play. In poetry and art, in certain stages of inspiration, the imagination and reason and will seem to play rather than to work, and the poem or symphony, the picture or the oration, appear to come of themselves, like the school-boy's whistling in school, when he told the angry master that he did not whistle, but it whistled itself. Such spontaneous movements of genius, however, generally imply previous training and earnest study, and they prove instead of refuting our principle by showing that work may and should be transformed into play, while in its own essential nature it is not play. Play of itself is free, joyous, enlivening, and as such it begins the education of childhood and completes the ripest culture of age. The child plays because he can not well help it, and his heart leaps up like a natural spring. The mature man plays because his culture is so complete as to be a second nature, as in a great park or city the waters flow and sparkle from aqueducts built by science and from fountains perfected by art.

We make, of course, a great mistake if we overlook the active element in play, and children and grown persons must not get their sport too easily, nor enfeeble themselves by sedentary amusements. Here the important distinction of the active and passive voice opens upon us. In base-ball, in cricket, in billiards, in bowling, and in quoits and foot-ball, there is wholesome stir of the limbs and the blood, and also good exercise for the perceptions and judgment. Spinning the top and flying the kite, playing marbles and battledoor, are milder sports, yet they have their use for the mind as well as the body, and they have place in physical education too important to allow any sensible man to despise them. We tend generally very much, however, away from all these out-door active plays, and we like to get our amusement as easily as possible, with the least loss of time or cost of effort. Hence the great prevalence of the sitting plays, the sedentary recreations. These are of various kinds, according as they quicken the perceptions and the understanding at the table, as in the case of draughts, backgammon, or the less objectionable forms of card-playing; or as in the case of riddles and charades and conundrums, they stir the wits; or in the play of girls with dolls and puppets, which start the fancy; or, lastly, in the games of chance, that move hope and fear without calling out any worthy action of mind or heart, and which are of doubtful service even in their mildest forms, so ready are they to encourage the accursed passion for gaming. Now we certainly need to bring out the more active class of plays, and men of business and the professions would be much better every way if they would keep up the usages and the spirit of their youth by going with their children and young people to the base-ball ground or the bowling-alley. It is the merest drivel to speak of any of these wholesome sports as bad because they are sometimes abused. A billiard-table and a bowling-alley are no more evil in themselves than a dining-room or a bath-house, for each of these may and has been perverted to monstrous corruptions.

It is becoming a very practical question how far the active sports should become so intense and personal as to excite emulation and influence partisanship, as is so often the case with our rowing matches and ball-playing. Here a second distinction, based upon emulation and its absence, presents itself. Too often these contests cease to be plays, and when the victory secures either a valuable prize or a substantial honor, the sport is too serious a business, and sometimes it brings health and even peace of mind into peril. It is fun to see Harvard and Yale or Oxford and Cambridge rowing for the mastery, but the brave fellows who are straining their muscles to win the day for their color are not especially jolly, and no work is harder than theirs. Young men must, indeed, be manly, and not mind roughing it sometimes, and the boat-race is of a piece with the scramble of life, and one must not be overdainty in play when we are to try our hand and take our chance in the rough-and-tumble of the world. It is best, however, to give to manly plays as much geniality and harmony as possible. We can not ask young men, indeed, to be content with dancing all the time with ladies in sympathetic round and party regulation. Nor can we hope to confine them to the routine of the gymnasium and its feats of turning and climbing. Military sports meet their active temper very well, and marching and countermarching with banners and music are better and more friendly exercise than the everlasting fight for supremacy, whether with the oar, or the foot-ball, or the cricket bat. It is well to calm the pulses of youth, and even of children, by adding plays of representation to active sports, and a finer quality of fellowship goes with hearing music, seeing tableaux and pictures,

walking in the fields, or rowing or sailing quietly amidst pleasing scenery, or joining in a social party with its constant change of scenes and persons and recreations. We ought to make more of this style of amusement, and try to refine and dignify the love of fun in our young people by more taste and beauty.

Playthings have a great deal to do with enjoyment, and the oldest of us are but children of a larger growth, who must have something to play with. Here a third distinction in play appears. Mere implements of sport can not be called playthings, for they are tools, and chess-men, cards, dice, cricket and base-ball bats, and the like, are not playthings, as hoops and dolls, kites and tops, tin soldiers and wooden swords, whips and rocking-horses are. It is wonderful how much fancy and thought go with the rudest of these playthings, and how much life a bright girl will put into a rag baby, and how much fun and fire a stout boy will get out of a wooden sword or a hobby-horse. Our philosophical German neighbors, who have made a serious study of play as part of education, have gone so far as to give a metaphysical definition of the distinction between the mere implements or tools of play and genuine playthings, the former of which they call synthetic, as having settled uses, and the latter they call analytic, because these have undefined uses, and call out the powers of invention, fancy, and adaptation. There is great danger of our forgetting this distinction in our modern passion for expensive toys. The most costly toys are not playthings, but articles of show and luxury. A magnificent wax doll is not so good for a little child to play with as a rag baby; and a great gilded chariot, with stately horses and grand trappings, does not stir a boy's faculties, nor admit of such free and various play, as a wooden wagon that can be dragged about at pleasure in mud and grass, and loaded and unloaded at will. We, who are great boys and girls, ought to have an eye upon keeping some of our playthings in spite of the stateliness and pride of our social ways; and perhaps our liking for puppies and kittens, and our delight in a free ramble in the woods, with a stout stick and a gamboling dog for our companions, may be a rebellion of our lingering childhood against our strait-laced age.

The charm of true playthings is that they make us at home with ourselves, and they do not depend upon conventional society for their attraction. How much a man can enjoy a walk with a cane cut from a tree with his own hand, without fear of hurting its beauty by thrashing with it right and left as he wills, and leaning upon it or swinging it in the air at his pleasure! A boy will ride upon it, and make a horse, or a gun, or a pike of a stick, as the humor takes him. The little baby in the cradle finds music and motion and taste and freedom in his rattle, and the man who can not delight in some sort of a rattle, some form of pleasing illusion, as long as he lives, has not kept the wisdom or the joy of his childhood. Sociality, indeed, must have its due, and we must be content to yield our exacting individualism, and use the methods and implements that are essential in organized social amusements. Yet, after all that we may say of social enjoyments, the main pleasure is in the sociality itself, and the arts and appliances that we use to amuse us have their chief value from our social instincts and satisfactions. So it is that often nature tricks us for our good, and we think that it is the dress or the furniture, the pictures or the books, the song or the dance, that we care most for, when it is the people themselves, and especially the few chosen persons, or the one charming presence in whose light we live. To Romeo the palace and the garden of the Capulets are a mere toy with which he plays for Juliet's sake, and he would drop the toy but for her, since without her the plaything would not bring his love into play. We ought to be aware of this fact more in the arrangement of society, and favor the proper association of young people without too costly entertainments or extravagant dresses. It is fun enough for generous young men to be in the society of agreeable young women, and such association is an important part of their culture, as of their enjoyment. And play should respect that old sentiment of chivalry, and while the sports of children should not stir the love passion precociously, and juvenile plays and books should not appeal to this sentiment at all, it may properly be recognized and wisely guided and guarded in the amusements of mature society; and music and conversation, the promenade and the dance, may move romantic fancies and stir gentle sentiment within the limits of delicacy and rectitude. Probably play has had much to do with awakening love, and the history of popular amusements is closely connected with the course of courtship and marriage. A game of blind-man's-buff has undoubtedly made many a hand find its mate that might otherwise have come short of the mark, and many a merry song has ripened a sentiment and matured a declaration that else might not have come to the point. Touchstone at the village fair and Benedick at the governor's ball are both helped by the music and the dance that bring the old, old story to tell their secret, and hint their new word before they venture to speak it out.

Exactly whither we Americans are drifting in our sports it is not easy to say with entire certainty. We are in all appearance much merrier than thirty or forty years ago, and besides enlivening our old national holidays and adding new ones, we are coming into contact with the national festivities of Europe, and feeling the touch of Latin and Anglican Catholicism and of German music and muscle. We are trying pretty hard to adopt the English field-sports, and to ride and drive like John Bull and his children. But our Central Park, superior as it is to Hyde Park in range and beauty, sees no such company of equestrians, and a stray riding-habit or two is often the only specimen of the lady equestrian here; while there every fine day brings squadrons of horsewomen, who ride their high-stepping blood-horses as if horse and rider were one, and a flock of griffins were winging it over the road. Yet the English lack light and spiritualizing play, and their sports, like their meats and drinks, are too heavy for the best life and the finest movement of nerves and limbs and features.

There is one view of play that bears upon the course of civilization itself, and starts most fruitful questions. It concerns the bearings of modern society as such upon pleasure. We have been going on now about four hundred years in our new paths, and we have gone from the old

Roman empire and priesthood into the realm of popular liberty, national life, and general fellowship and progress under the lead of the new science and art. The great leviathan—a huger and finer creature than Plato or Hobbes dreamed of—has been showing his limbs and trying to play, not always with entire success. The new age began, indeed, with a burst of merriment, and the Renaissance let nature out of its convent and cowl, while the Reformation opened the old Bible, and made the new and stirring hymn-book of the people. But with new freedom new care and anxiety came, and the leviathan has found himself cutting his teeth somewhat hard, and also like other children taking his turn at the measles and chicken-pox, and other eruptions more serious. Yet he has always contrived to play, and he is probably playing more and more, and reaching out his hand to master his new and mighty implements to play with them. The science of nature presents and interprets forces of light, heat, air, electricity, and life that are helping out the true play of body and mind, while the great masterpieces of mechanism, the locomotive, the press, the telegraph, the organ, the piano, and their fellows, are lifting heavy burdens from the leviathan's neck, helping him make play of much of his work, and sing and pipe while he delves and travels. We shall soon see more clearly this cheering influence of the new universal science and art, and find that back of and above all nature a loving spirit is waiting to help us in our work and play. The cosmos may interpret anew old Hildebert's hymn of a thousand years ago, in which he calls the supreme love "mitis, hilaris, melodia civium gaudentium"—"gentle, jovial, the melody of joyful citizens."

We have lately lost two of the great players of our time, Forrest and Macready, and they who once had a fierce feud with each other, which led to a bloody riot in this city, have gone to the grave almost together. They have done much to stir and educate a portion of the public—the one more the idol of the rough, the other more the favorite of the gentle. It is well that they both tended toward humane affections and uses as their lives drew near the close. The English scholar in his retirement was noted for his interest in the poor and suffering, and the American athlete provided generously for the widows and orphans of his own profession. They have had much to do with the play of our century, and they could have told us much that is new and important as to the drift of their art. They were undoubtedly both disappointed in the tendency of the stage and its patrons. They found themselves supplanted by a different style of artists, and the regular drama set aside for sensational spectacles and coarse burlesques. They also felt something of that encroachment of the new literature and art upon the stage which is felt by the pulpit. Newspapers, magazines, illustrated books and papers, concerts and lectures, now have the eye and ear of the people, and they also bring the great world before us in a never-ceasing round of novelty and excitement. To the inhabitants of a great city like ours the very streets are a theatre, and the news of the day is a drama often more stirring than any tragedy upon the stage. While we are writing, a venerable bishop's funeral near by is set before us in print and picture, and the Chief Justice's death is cried in our ears; and of late horrors by fire and water, by wreck at sea and by falls of people and trains on land, give us too much excitement to prompt us to seek the tragedian's help to lift us from stagnation into life. There is something, too, in the incessant competition of our time and the anxious thought for a living that makes us too weary and too much engrossed to crave the intense and protracted excitement of a great drama. Hence the taste for pleasantry and trifling, the rage for fine scenery and properties, with flashy dialogue and dashing costume, and the frequent favor given to nonsense set off with nudity. The stage is not, on the whole, rising, and better things should be expected of it, in spite of the great and inherent difficulties of a business that exacts so much money to pay its large retinue, and which must sell tickets to the masses, who are not all refinement, and meet their tastes. The theatre, however, and the drama are not the same thing, and if the stage loses its true caste, which we deprecate, the drama will keep its dignity, and literature, oratory, the platform, the parlor, the school, the college, and even the pulpit will vindicate its majesty as the creation of God and the mirror of nature and life.

Editor's Literary Record.

POPULAR SCIENCE.

The Depths of the Sea (Macmillan and Co.) contains the results of explorations made under the auspices of the British Admiralty during the years 1868, 1869, and 1870 by Mr. Wyville Thomson (the author of this volume), Dr. W. B. Carpenter, and Mr. George Jeffreys. If science renders art possible, it is also true that art prepares for a development of a true scientific knowledge, and Mr. Thomson shows how it was through the laying of the Atlantic cable that the scientific world was first compelled to abandon its old hypothesis, based on *a priori* reasoning, that life did not and could not exist below a certain depth of the sea, and to recognize the truth that the bottom of the ocean is rich in both fauna and flora as beautiful in structure and evincing as wonderful skill in design as any that are to be found upon the land. In Professor Thomson's expedition, investigations were carried on at the depth of three miles. The difficulties of conducting such an examination may be in part imagined. Professor Thomson's book is purely scientific and unnecessarily technical. It is unfortunate that he couches his information in such language that, but for the illustrations, the fauna and flora might as well be left at the bottom of the sea for all the good they do the unscientific reader. This characteristic of the book will confine its

value to those who possess not only scientific enthusiasm but also a good degree of scientific knowledge. The illustrations, however, even without the descriptive matter which accompanies them, will give any reader a good pictorial representation of sea life, and so will answer the purpose somewhat of a cabinet of sea shells and weeds. They are beautifully drawn, engraved, and printed.

Professor TYNDALL'S *Lectures on Light* (D. Appleton and Co.) will be more valuable as a memento to those who heard the original lectures than as a substitute to those who did not. Professor Tyndall's avowed object was to illustrate the truth by a series of experiments, which his lectures were simply intended to interpret. It was the brilliance and beauty of the experiments which constituted the charm of the course, and diagrams are but a sorry substitute. The book is the play of *Hamlet* with Hamlet omitted.

M. FLAMMARION'S volume, *The Atmosphere* (Harper and Brothers), is one of that class of works which apparently no one but a Frenchman knows how to write. *Harper's Magazine* has already given its readers some taste of the quality of this volume, and we need not say more than that the feast realizes all the expectations which the taste awakens. With the genius of the Frenchman, the author seizes on those aspects of scientific truth which pen and pencil can portray readily and graphically to the reader, and the result is a work which is none the less scientifically valuable because it has none of that dryness of statement which is supposed to characterize scientific treatises. It embraces an account, not only of the atmosphere itself, but also of the phenomena produced by it, or connected with and dependent on it, such as sound, light, and temperature. The volume is profusely illustrated.

HISTORY AND BIOGRAPHY.

MR. T. B. H. STENHOUSE has evidently spared neither time, labor, nor care to render his work on Mormons and Mormonism, *The Rocky Mountain Saints* (D. Appleton and Co.), full, accurate, and trustworthy. It gives a history of the whole extraordinary movement from its inception in the first vision of Joseph Smith almost down to its latest phase—the contemplated emigration from Salt Lake to some point still more remote from the intrusive and irresistible influence of railroads. It is in every way unfortunate that the American public have received their impressions of Mormonism from the reports of travelers who have seen only the outside, which is like sepulchres, clean and white, and have only guessed—sometimes not even that—the inside, which is full of corruption and dead men's bones. The consequence is a general impression that Mormonism, as a political, civil, and religious system, is a bad one, but nobody's business but that of those who choose to put themselves under it. That such a monstrous despotism should have been allowed to grow up, and grow strong, and intrench itself by every form of public fraud and open highway robbery, and repeated and undisguised assassinations, under the protection of the United States flag, and at times even with the official sanction of the United States government, which Brigham Young, as Governor of a United States Territory, holding his commission from Washington, represented, is one of the marvels which will be a puzzle to the historian of the future quite as much as the Spanish Inquisition, disavowed by the popes and yet doing its bloody work in their name, is to the historian of to-day. The story of Mormonism is not pleasant reading; it makes one's cheeks tingle with shame to read the story of brutality, lust, and outrage which have marked its whole course with blood and high-handed murder, and then to reflect that not only this tragedy has been enacted on American soil, but that the perpetrators have gone unwhipped of justice to the present day. But it is necessary reading; and if the American people could but once become possessed of the simple narrative as Mr. Stenhouse gives it, sustained as it is throughout by the testimony of eye-witnesses whose means of knowledge can not be doubted, and whose veracity there is no reason to question, it would be strange if the Mormon prophet even now were not punished for his crimes, and stranger still if he were not by the strong arm of law bereft of his official power for evil in the future. Mr. Stenhouse was, he tells us, for twenty years a Mormon elder and missionary, and was editor and proprietor of a Salt Lake daily paper. He does not, however, trust to personal observation for his means of information; indeed, he gives little or nothing of his personal experiences. A delicacy which, in treating of such crimes and such a criminal, is quite overstrained has kept him "silent on all that he saw or heard while Brigham's guest, or when with him in the capacity of a friend." More personality would certainly have added to the interest of his narrative. But the fact, evident in every chapter, that he has sought testimony from others, and that both from the friends and the foes of Mormonism, has added to the force of his book, which has all the weight of an indictment after a patient, unprejudiced, unfearing, and indefatigable investigation.

There are several points of interest about *Memoir of a Brother*, by THOMAS HUGHES (J. R. Osgood and Co.), that raise it above the level of an ordinary memoir even for the American reader. George Hughes, the subject of this volume, is unknown in this country, but Thomas Hughes, the author, is both widely known and highly honored, and his memoir, almost as a matter of necessity, includes the story of much of his own life, especially the earlier portion of it. Without the least semblance of egotism, it is in a measure autobiographical. But more than this, the brothers Hughes may be fairly regarded as types of the best specimen of English character, and, curiously enough, of opposite temperaments and poles of thought and feeling, one being by constitution and in his political and church relationships a pronounced radical, the other a conservative—one a man of sanguine and progressive temperament, the other of a taciturn and grave mood. This book gives an insight into the influences both at home and at school which go to make the English character what it is, and to impart to it its peculiar steadiness and quiet determination. The letters of the father to his son, the close, kindly, sympathetic following of him in his school career, the counsel, the hearty appreciation of that chivalry in school life which our good books, if not our good

parents and teachers, appear to be constantly striving to repress, are worth the study of every American father. Not the least interesting feature of the book, however—perhaps that which is of the most general interest—is its psychological aspect, its presentation of these two singularly diverse natures, born of the same parents, growing up under the same home influence, attending the same school, and learning from father and from teacher the same grand lesson—to be true not to any external ideal, but to the nature which God had given them, and earnest in the maintenance of their own convictions, with supreme indifference for the shams and the conventionalities which are current in the great world about us in all philosophies and sects and parties. The very fact that this volume was written, as the author tells us in the preface it was, not for the general public, but for his own sons and nephews, gives a certain fullness and minuteness of detail and freedom of treatment which may possibly verge occasionally on intrusion on sacred privacies which do not belong to the public, but which add all the more, not merely to the interest, but to the value of the book. It is a rarity in literature—a *true* memoir.

The *Life of Samuel J. May* (Roberts Brothers) is an inspiring one, and is well told, mainly by himself; for the first nine chapters are an autobiography, and bring down his life to the commencement of his pastorate at South Scituate, 1836, and the remaining chapters are made up largely of extracts from his diary and correspondence. Mr. May's life was indissolubly connected with the life of the American nation, whose progress in reform he not only witnessed, but largely aided to produce. It is chiefly as a reformer of public abuses, not as a preacher of the Gospel in its personal application to individual souls, that Mr. May will be known. And in the work of public reform no minister of the past half century was more assiduous, more courageous, more faithful to his own convictions, or more Christian in dealing with what he deemed the erroneous convictions of others. He was active, though never bitter, in the theological controversy which resulted in the separation of the Unitarian from the orthodox churches of New England; was one of the earliest advocates of total abstinence, maintaining it as a principle both in the pulpit and on the platform; identified himself throughout his ministerial career with the cause of education; consecrated himself to the antislavery cause from a period antedating his ordination; received his first antislavery impulse from the sight of a chain-gang of slaves in Maryland; labored during the war with heartiness for the welfare of the soldiers of the Union; was yet by nature and throughout his controversial career a lover of peace and a peace-maker, an opponent of capital punishment and of corporal punishment; and, in brief, gave himself to the work of civil, political, and religious reform with a single-heartedness and fidelity to principle and a kindness and consideration toward opponents which can not fail to elicit the admiration of all.

ESSAYS.

In an introductory note to Abba Goold Woolson's *Woman in American Society* (Roberts Brothers), Mr. John G. Whittier says of these essays that they are "gracefully written, yet with a certain robust strength—wise, timely, and suggestive—their language clear, felicitous, and pliant to the author's requirements." In and through them, we may add, is a vein of strong practical common-sense. The authoress does not look forward to a future Arcadia in which women shall vote, hold office, preach, practice law and medicine, monopolize the platform, and carry on the general public functions of society and government, nor does she make any attempt to incite the ambition of her readers in this direction, or to prepare them for this work. She speaks of women in society as it now exists, and of duties which, as individuals, they can take up and perform without waiting for the social revolution which will make the "coming woman" the head of the political fabric, as well as "queen of the home." Her themes are such as "The Accomplishments," "Getting Married," "Evening Parties," "Charitable Fairs." Her chapters are, in short, plain, practical sermons on the every-day duties of the woman of to-day in the place which to-day she occupies, with no attempt at brilliance, and yet no real dullness, no surprising or *outré* ideas, unless her advocacy of woman's right to propose for a husband be an exception, but rendered decidedly entertaining by the writer's art of "putting things." Our clerical readers will find suggestions for practical discourses in these essays, and our young lady readers will find in them more excellent counsel than most of them will have the courage to follow.

Reason versus The Sword (G. P. Putnam's Sons) is an attempt to embody in a treatise, and in a comprehensive and logical form, the argument against the use of physical force in government—for to this the so-called "peace principles" inevitably conduce. The author is not afraid of the logical conclusions of his position, and unhesitatingly condemns the late civil war as one for which both parties were about equally to blame. He rests his argument against war in all its forms on three general grounds—first, the theological or Biblical; second, the political; third, the moral. He certainly covers the whole ground, and leaves little or nothing to be said upon the side and in favor of the principles which he advocates. But when he undertakes to say what he would do to enforce the law against flagrant law-breakers who refuse to submit to reason, he breaks down with the confession that "the question does involve difficulty," and passes it by in a foot-note, in entire oblivion of the fact that it is *the* question in the case. In conceding that "in its inherent nature war is not wrong, that when God commands it, and the command is obeyed through motives of pious obedience, the act of making war is not wrong," he directly, though unconsciously, abandons his case, since this is all that any Christian claims regarding war. The only question left is this: Do the higher interests of humanity require that government shall, when force becomes dangerous, threatening, and subversive, repel it with force? If so, these higher interests interpret the "command of God" as truly as a voice from heaven, and more truly than a dream. Those who deny the right to use force for their preservation are bound to show how, in case of such invasion, these higher interests can be otherwise preserved from utter subversion, which becomes not only

a "difficult question," but to all "peace men" the all-absorbing question. If Mr. WASHBURN had attempted to define the limits within which a resort to force is admissible, he would have rendered national and international peace a good service. He has undertaken to prove too much, and, as a consequence, will fail to carry the minds of his readers with him at all.

Mr. EDWARD ROE'S second venture, *Play and Profit in my Garden* (Dodd and Mead), is characteristically unlike his previous volume. That was a dramatic novel which bordered on the sensational; this is a quiet pastoral, as placid as the river on whose banks the experiences were enjoyed out of which it has been wrought. *Barriers Burned Away* was a tale of love, of romance, of frightful conflagration. *Play and Profit in my Garden* has in it no love but an ardent love for nature, no romance but the romance of the Highlands of the Hudson, and no catastrophe worse than the occasional failure of a crop. The author takes us to his garden on the rocky hill-sides in the vicinity of West Point, and shows us how out of it, after four years' experience, he evoked a profit of $1000, and this while carrying on pastoral and literary labors. His suggestions are practical; the mistakes and disappointments as well as the successes are recorded; the style is always genial and often piquant; and even for city-bound readers who have no garden, and never expect to have one, his book will prove extremely interesting summer reading. Indeed, we are not sure that it will not be safer for them than for those who have the land to essay Mr. Roe's experiment and not the agricultural genius to make it a success. It is very rare that so much literary taste and skill are mated to so much agricultural experience and practical good sense.

H. H., in *Bits of Talk about Home Matters* (Roberts Brothers), shows greater skill in the criticism of the selfishness, the short-sightedness, the petty tyrannies, which so often convert the home into a despotism, than power in pointing out a better way or inspiring to it. She has a womanly heart, which has been sensitized by wifely love, mother love, and much sorrow; she has traveled much and seen much, and her heart has taken vivid impressions of the wrongs which have made many a wife and mother burn with an unuttered indignation. But she has power also to reproduce the impressions she has received, and her *Bits of Talk* will do good, because they voice the silent protest of so many womanly hearts—echo what so many wives and mothers have felt, but have never been able to express.

FICTION.

THOSE of our readers who have followed the course of *The New Magdalen* (Harper and Brothers) in the pages of this Magazine do not need to be told that it ranks among the best of WILKIE COLLINS'S romances — that is, among the best productions of the best of modern romance-writers. For Wilkie Collins curiously mates the old and the new schools of novelists, reproducing the romance which belonged to the age of which Walter Scott may be regarded as the finest representative, but in the modern dress, and with the modern incidents and personages whose portraiture constituted the charm and the power of Dickens and Thackeray. The story of *The New Magdalen* is short, the characters are few, the plot is simple; but the whole story is wrought with that consummate skill and that perfection of detail which render its author without a peer in his peculiar province.

Of *London's Heart* (Harper and Brothers) we have little need to say more than that it is one of B. L. FARJEON'S novels, and that it possesses the same characteristics which distinguish his previous stories. It is a much more elaborate novel than *Bread-and-Cheese and Kisses*, with a more conventional plot, in which gambling, betting, love, an attempted seduction and its frustration, are wrought up with considerable elaboration. Mr. Farjeon has no special aptitude for the construction of an intricate plot, and his simpler stories are his best; but there are abundant opportunities for the manifestation of his peculiar genius in *London's Heart*, which is a superior novel in spite of its plot.

The interest of *Oxley*, by LYNDON (Scribner, Armstrong, and Co.), lies in its picture of the development of character under the ordinary circumstances of daily life. Though there are, perhaps, no larger number of characters introduced than are usually to be found acting and reacting upon each other in the common experiences of actual life, yet there are almost too many to be shut up within the covers of a book, and to be watched through the glass of the story-teller. In other words, the field is rather too large and the objects rather too minute for sustained interest.—Quite the reverse in character is *Expiation*, by JULIA C. DORR (J. B. Lippincott and Co.), which involves the story of but a single family, and centres on a single extraordinary and improbable incident. If, however, the supposed death but real flight of the mother be granted as a possibility—and it is not an impossibility—all the rest of the story follows naturally enough. The plot, though somewhat forced, is certainly ingenious, and is skillfully carried out throughout the novel.—*Ups and Downs*, by EDWARD EVERETT HALE (Roberts Brothers), is mostly "ups." It is the story of a hero who, graduating with honor, finds his expectations rudely dissipated by the sudden failure and death of his uncle. Thrown upon his own resources, he begins life at the bottom, and steadily works his way up by faithful industry. There is a heroine who goes through a similar process of "ups;" and of course they marry at the end. Moral: True manhood and true womanhood can not be crushed by untoward circumstances. Culture neither gives success, nor, rightly held in subordination, hinders it.

MISCELLANEOUS.

A CONSIDERABLE portion of *Palmetto Leaves* (J. R. Osgood and Co.), if not the whole of it, has appeared in successive articles in the *Christian Union*. Mrs. STOWE is in love with Florida; but Mrs. Stowe is not such an enthusiastic lover that she is blind to the faults and defects of her idol; and her book contains both charming descriptions of Florida scenery and life, and wise counsel to invalids and others who have considered the question of moving there either for a temporary visit or a permanent home. Mrs. Stowe does not believe in it as a permanent residence for those who are accustomed to the

Original from UNIVERSITY OF MICHIGAN
Generated for Nicole Fry (Washington University in St. Louis) on 2017-09-19 15:21 GMT / http://hdl.handle.net/2027/mdp.39015056090551
Public Domain, Google-digitized / http://www.hathitrust.org/access_use#pd-google

more bracing and invigorating climate of the North. Her conception of the function of Florida is somewhat limited. "Florida is peculiarly adapted to the needs of people who can afford two houses, and want a refuge from the drain that winter makes on the health. As people now have summer houses at Nahant or Rye, so they might, at a small expense, have winter houses in Florida, and come here and be at home." Her praise of Florida is as quaint as it is significant. "Nature down here is an easy, demoralized, indulgent old grandmother, who has no particular time for any thing, and does every thing when she happens to feel like it." We may reasonably assume that our readers know Mrs. Stowe's character as a writer; and we need only say that this book possesses, as all her writings do, an infusion of her own peculiar and pleasant personality—a personality in which a poetic and almost dreamy nature is singularly commingled with that peculiar prosaic, practical, and common-sense view of life which is characteristic of the New England mind, and is the product of New England education.

The second volume of the "New Variorum Edition of Shakspeare" (J. B. Lippincott and Co.) comprises *Macbeth*. It consists of the text, with elaborate annotations from various Shakspearean critics, and an appendix which embraces Davenant's version of the play as enacted at the Duke's Theatre in 1674, a treatise on the source and date of the play, and some other cognate themes, and some specimens culled from the best English and Continental criticism both of the play as a whole and of single features. The editor, HORACE HOWARD FURNESS, has undertaken a work of great labor, and has performed it with singular painstaking and fidelity. For a real elucidation of the play, a much smaller selection of notes and greater discrimination in their admission would have been more useful, though, perhaps, it would have rendered the work less valuable to Shakspearean scholars. The very first note, for example, raises a question, which we do not imagine Mr. Furness himself at all entertains, whether the first witch scene be not an addition by a later hand; and the bare raising of it would perplex rather than assist the ordinary reader.

Those who are fond of fishing know that the charm of the sport is not in the mere catching of the fish, but in the various accompaniments—the companionship, good fishers being always genial companionable men; the romance of nature, fish always making their haunts in nature's most beautiful and romantic nooks; the stories which enliven the camp, when, after a hard day's sport and a hearty supper, you sit with your companions round the huge fire, aiding digestion with many a good story and hearty laugh. In *I go a-Fishing* (Harper and Brothers) Mr. W. C. PRIME introduces the reader to all these surroundings of a fisherman's life. He does not pretend to give any useful information. His book is simply a vacation book, a tramp in the woods, a repose by the lake-side. He proves himself a most delightful companion for a fishing tour, the poetry and romance of which he heartily appreciates and admirably interprets.

New Life in New Lands (J. B. Ford and Co.) is largely composed of letters written to the New York *Times* by "Grace Greenwood" concerning her saunterings in the West. She writes with the easy and graceful brilliance which is in pleasing contrast with the attempted wit and labored glitter which usually characterize gossipy newspaper correspondence. She writes like a vivacious woman who feels keenly, but not deeply, and can interject a merry laugh in the midst of her description of the awe-inspiring scenes of the earthquake without any sense of incongruity on her part, and without producing such a sense upon her reader's mind. Her pictures of both nature and humanity are painted with few touches, yet are wonderfully vivid and effective.

CELIA THAXTER'S *Among the Isles of Shoals* (J. R. Osgood and Co.) introduces us to a romantic spot in American coast scenery which is far less known than it ought to be. The authoress has picked up not a little of the romance and adventure of the sea, which she has woven in with her descriptions of nature in its various moods in a book which is far more entertaining than such books of description are apt to be.

Editor's Scientific Record.

SUMMARY OF SCIENTIFIC PROGRESS.

AS heretofore, we begin the present number of the Record by an account of the more prominent advances in the various departments of science.

In the *Mathematical* world a notice reaches us that the highly useful journal generally known as *Grunert's Archives*, and now in its sixtieth volume, will be continued by Professor Hoppe, on the same principles as have been adhered to by its lamented founder.

In *Optics* we note the very clear expression by Professor Draper of the views he has long held, and which are apparently now widely accepted, as to the presence of actinic power in every portion of the solar spectrum, and the deduction of the highly important general law that the rays given out by a burning body, or absorbed by it when quiescent, are those that are consumed in doing internal work, and especially in producing chemical changes. A paper looking to the same conclusion is published simultaneously in the Vienna *Journal of Photography*.

In the science of *Electricity* and its branches, as well as their applications, there continues to be a ceaseless activity, that indicates as well the importance as the profundity of the mysteries of this force. The theories of Edlund, of Stockholm, having been now at last published in the French journals, are seen to afford exceedingly suggestive explanations of many electrical phenomena, and have been more or less supported by the researches of Neumann, and especially of Sundel. The important phenomenon of the secular change in the earth's magnetism promises to receive some attention in connection with

the proposed resurvey of the boundary between the States of New York and New Jersey; but the most important work in this field has been inaugurated in connection with the "Bache fund," *i. e.*, the determination of the magnetic force, declination, and dip for nearly forty points in the interior of this continent, a report on which was recently read by Professor Hilgard, of the Coast Survey. Some very striking and novel views have been adopted by Hankel, of Leipsic, as the logical result of his thermo-electrical studies among crystals—views that would seem to require a revision of the old theories of crystallography.

In *Astronomy* very considerable interest continues to be manifested in the preliminary experiments with apparatus designed for the approaching transit of Venus. In England the observers are already practicing on artificial transits, and thus acquiring that facility that long experience alone can give. Hansen and Schott have each contributed valuable papers—the one theoretical, the other practical—on the measurement of photographs of the sun; and the Kew photoheliograph has been used in photographing an artificial divided scale, the results showing to what extent the image is distorted. The Kew Observatory has ceased its systematic solar photography, and that work is very properly transferred to Greenwich, on account of the intimate connection between sun-spots and terrestrial magnetism. Papers have been communicated by Professor Watson on the very faint variable stars and the probable number of asteroids; by Professor Alexander on some remarkable relations among the planetary orbits; and by Winlock on the work done at the observatory of Harvard College, where, besides the meridian observations on a zone of faint stars, there is also maintained the most complete set of daily photographs of the sun that has as yet been obtained any where in the world.

The reports of the various parties that, under the auspices of the Coast Survey, observed the solar eclipse of August, 1869, have just been published as an appendix to the Coast Survey report for that year, and, though so late, are a welcome addition to our knowledge of that phenomenon. The study by Mr. Schott of the photographs taken on that occasion is stated by Professor Peirce to have been very profound and satisfactory. The volume of Observations in 1870, made at the Naval Observatory at Washington, has also just appeared. Its increased bulk is largely accounted for by the valuable appendices, among which we remark especially the interesting paper by the librarian, Professor Nourse, on the history of the institution, and the catalogue of standard places of fundamental stars by Newcomb. The annual report of the directors of the Edinburgh Observatory announces the almost entire completion of the two-foot reflector destined for that observatory.

The position of director of the National Observatory at Paris is now again filled by the renowned Leverrier. It is announced that a small observatory has been fitted up in the grounds of Columbia College, in New York.

The question of the *Aberration of Light* is reported by Professor Airy as settled in favor of the value that has been in use for many years by the English astronomers, by the accordant results of the second year's observations at Greenwich with the so-called water-telescope. In solar physics Vogel has published a short but excellent study into the absorption, by the sun's own atmosphere, of the rays that produce chemical changes on the ordinary photographic plates. In regard to the manufacture of large reflecting telescopes, Professor H. L. Smith, of Geneva, New York, makes a suggestion that is the result of his own actual experience—*i. e.*, that cast iron is an excellent substance for speculum metal, and that by plating the reflecting surface with nickel we obtain a mirror that will not tarnish. The great Melbourne telescope, four feet in diameter, has not yet been repolished; but Mr. Ellery, the director of the observatory, announces that he is having great success in his work on small mirrors, and expects soon to feel warranted in attacking the large one.

In *Meteorology*, so far as the United States is concerned, the army weather bureau continues, with its usual success, to keep all informed of the general state of the weather: its monthly reviews and weekly chronicles are issued with unfailing promptness. The month of April seems to have been unusually cloudy, cold, and rainy. A system of telegraphic reports of the state of the water in the river channels has been instituted, that promises to supply a want that has long been felt. It is gratifying to be able to announce that the well-known American astronomer, Dr. B. A. Gould, has been instrumental in establishing an excellent system of meteorological observations in the Argentine Confederacy, where he is now temporarily residing as director of the National Observatory. The publication by the London Meteorological Office of such extracts from the logs of vessels as illustrate the condition of the weather during January and February, 1871, over the northern portion of the Atlantic Ocean, gives probably the best connected view that has as yet been vouchsafed of the details of the meteorology of this part of the ocean. The great work of Coffin on the winds of the globe is announced as nearly ready for publication. Dove announces as the result of a careful study of observations in England, in regard to simultaneous changes of season at neighboring stations, that he finds that the views put forth by him some thirty years ago are completely sustained. The Central Physical Observatory, of St. Petersburg, now under the direction of M. Wild, after an interval of several years, has issued a volume of meteorological observations for the year 1870, which is distinguished by the care taken to secure an increased degree of accuracy in the results. Among the special memoirs we note that of Celoria on the storm of August 21, 1872—one that seems to have been of unprecedented fury in Milan as regards the wind, yet was not marked by any unusual barometric or thermometric changes. On the application of meteorology to the determination of altitudes there have recently appeared two researches—those of Neubert and of Schoder—both relating to the use of the aneroid barometer. Molner, of Austria, from his long experience in charge of hospitals, has drawn some results in regard to the connection between disease and barometric changes; on the other hand, in Northern Germany, Prestel has studied with care the statistics of forty years in regard

to the connection between winds and disease. Both these authors show that there is a certain general dependence of disease upon the weather.

In the department of *Geodesy*, or mathematical geography, several results are announced worthy of a place here. Perhaps the most striking of these is the remarkable accordance between the newest and the two former determinations of the difference of longitude between Washington and Greenwich; the average of the three results now obtained may, it is believed, be relied upon to within the twentieth part of a second of time. Preparations are in progress for determining by the American telegraphic method the difference of longitude between Santiago de Chili and some point on the eastern coast of South America. A very suggestive report by Hartnup, of Liverpool, gives some idea of the comparative inaccuracy and unreliability of the chronometers generally used in the mercantile marine, and shows the great importance to life and property of more careful and frequent determinations of the rates of these time-keepers. The publication of the annual report for 1869 of the superintendent of the Coast Survey has already been referred to; it contains a valuable paper on the reclamation of tide lands and its relation to navigation. From a brief communication from this office it appears that the self-recording tide-gauges on both the Atlantic and Pacific coasts continue to record the effects of every important earthquake in producing extensive oceanic waves. A letter of the British consul at Havana announces the important fact that the return current, or anti-Gulf Stream, along the northern coast of Cuba has been unusually strong the past year, and that in general its strength is probably underrated; navigators in these waters should be on their guard against its influence. The great geodetic work of the extension of the French arc of the meridian has been prosecuted with unexpected success, it having been found possible to prolong the measurements directly across the Mediterranean from Spain to Algiers; the lines of vision that have been measured are in some cases two hundred and fifty miles long.

In our last summary we referred to the movements and operations of the British vessel, the *Challenger*, fitted out for deep-sea exploration, and chronicled her departure from the shores of England on her mission. Since then, after a short stay in the Bay of Biscay, she proceeded to St. Thomas, and thence to the Bermudas. On leaving there her intention was to take up a line of soundings almost to Sandy Hook, and then proceed on direct to Halifax, returning thence to the West Indies. Her object in this was to secure several lines of soundings across the Gulf Stream, so as to determine the physics and natural history of that great current. Already numerous facts have been ascertained, of great interest, and collections made embracing forms of animals entirely new to science. The deepest soundings by this vessel exceeded 3300 fathoms, no difficulty being experienced in reaching this depth and bringing up samples of the bottom. The trawl was used in water of a depth of 2000 fathoms, and secured rich treasures of animal life.

Mr. William H. Dall left San Francisco toward the end of April for the purpose of again taking up his exploration of the Aleutian Islands in behalf of the Coast Survey, in which he has been engaged for some time. Provided now with a new vessel excellently adapted to his purpose, he hopes to prosecute his labors with even greater success than during the past season. He is required to visit, among other places, the Western Aleutians, for the purpose of selecting a station for the landing of the American and Asiatic cable.

Mr. Alphonse Pinart, who has already spent much time in Alaska, is about returning to the coast of California in behalf of the French government, for the purpose of prosecuting archæological and ethnological explorations.

Nothing further has been heard from any of the European arctic expeditions since our last, although the note of preparation by new parties to start out during the summer is beginning to be heard.

Word has at last been received from the American arctic expedition on board the *Polaris*, which left the Brooklyn Navy-yard June 29, 1871, under the command of Captain C. F. Hall. The latest previous advices were under date of August 27, 1871, at Tossac, in Greenland, and the long interval that had elapsed without further news from the expedition had caused a considerable amount of anxiety.

The Newfoundland sealing steamer *Tigress*, while off the coast of Labrador, encountered a portion of the crew of the *Polaris* on the 30th of April last, which, while on the ice, had become separated from her on the 15th of October, 1872, in latitude 72° 35′, and driven as far south as latitude 53° 30′ during a period of 196 days, and without any casualties. The party reports the death of Captain Hall on the 8th of November, 1871, Captain Buddington succeeding to the command. It is hoped that the vessel will safely work her way through the ice, and return home during the course of the present year.

The report of explorations in the Gulf of St. Lawrence by Mr. Whiteaves, of which an abstract has been published, has lately appeared in full as a document of the Canadian government.

The expedition of Sir Bartle Frere to Zanzibar and elsewhere on the eastern coast of Africa, for the purpose of negotiating treaties for the suppression of the slave-trade, has, it is understood, been only partially successful. At latest advices he had left Zanzibar in further prosecution of his efforts.

No further news has been received from Dr. Livingstone. The party that accompanied Sir Bartle Frere to Zanzibar has, however, left Bogomoya, and the expedition by way of the Congo, under Lieutenant Grandy, appears to be fairly under way.

The report of the Geological Survey of Canada for the years 1871 and 1872 has lately been published, embracing an account of the geology of British Columbia and Vancouver Island. The survey is at present under the direction of Mr. Selwyn, who succeeded Sir William Logan in its command.

The report of the State Geologist of New Jersey for 1872 has also made its appearance.

A highly important announcement, if it prove to be correct, has lately been made by Mr. Calvert, namely, that man existed during the miocene period, this gentleman having found in the

miocene formation in the Dardanelles a sculptured bone, probably of Dinotherium, containing the representation of some animal; and, in connection with this, certain flint implements showing human workmanship. This would carry man's existence on the surface of the earth back much further than it has heretofore been asserted, his occurrence in the pliocene of California appearing, however, to be reasonably well substantiated.

The recent researches of Professor Wyman in the shell heaps of Florida brought to light certain human remains of a particular character, believed to be older than the rest, which in all probability were the remains of cannibal feasts, having been burned and split precisely like those of other animals.

Professors Marsh and Cope continue their announcements of discovery of fossil animals from the deposits of the Rocky Mountains, and are constantly adding to the list of strange and remarkable species. Professor Cope describes what he considers to be a flat-clawed carnivore, under the name of *Mesonyx;* while Professor Marsh contributes to the list the genus *Orohippus*, which he claims to be the long-sought-for link in the development of the horse from his many-toed progenitors.

Mr. Sanson calls attention to the probability of an error in referring certain equine remains of the south of Europe to the horse, and thinks it more probable that they belong to the ass, which would have been likely to occur in those regions.

A curious fact has been ascertained in regard to the development of the frog in Guadeloupe. It is well known that the eggs of frogs and toads generally give birth to tadpoles, which, after undergoing various changes in the water, become transformed into frogs. For this, however, water is necessary, and as Guadeloupe is almost destitute of this medium, it is found that the entire change takes place within the egg, and that the animal at birth is a fully developed frog. A similar condition to this has already been observed in regard to various species of salamander, which, while usually inhabiting water in the larvæ state, sometimes become completely formed in the egg.

Mr. Gulliver has been investigating the blood corpuscles of the fishes, and finds these to be larger in the *Salmonidæ* than in any other of the bony fishes.

No new light appears to have been thrown upon the subject of the grape-vine louse insect. The vine culturists in Europe are, however, anticipating a very disastrous experience as soon as the warmth of the season warms to life the eggs and larvæ of the destructive pest.

A potato disease has made its appearance in Germany, which threatens to be quite destructive. In this the stems are not attacked, as in the more common form, but the tuber is covered with a felt-like fungus, which very soon renders it unfit for food.

The subject of *Pisciculture* continues to attract much attention; and among the States that have recently appointed Commissioners and enacted laws for the protection and increase of their fisheries may be mentioned Michigan and Pennsylvania, both of them making large appropriations for the purpose. Attention is to be paid by these States, as well as by others, to the cultivation of the shad, the rapid diminution of their numbers where protective measures have not been entered upon furnishing a serious warning. In former years the Southern States abounded in this useful fish to an excess such that the possibility of any serious diminution was not entertained. The United States Commissioner, however, in carrying out the law of Congress for supplying the Western waters with fish, employed the services of Mr. Seth Green, first in the Savannah River, and afterward in other waters of Georgia and the Carolinas, to obtain a supply for the purpose in question. The shad, however, proved to be in so small numbers that the experiment there was an entire failure, and he has been obliged to proceed to more northern streams to carry out his plan.

The salmon eggs collected at Bucksport by the United States Fish Commissioner, in connection with the Commissioners of some of the New England States, have hatched out with very slight mortality, and the young have been placed in various waters, where it is hoped they will thrive, and in their growth furnish a great addition to the resources of the various States.

The most notable addition to botanical literature has been the publication of the first part of the second volume of Bentham and Hooker's *Genera Plantarum*, completing half of the entire work. This portion contains the whole of the *Compositæ* and the preceding gamopetalous orders. The number of genera here recognized as belonging to the *Compositæ*, the largest and most difficult of all the natural orders, is 768, including about 10,000 species. The genera are very nearly equally divided between the Eastern and Western hemispheres, while the Old World has a considerable preponderance of species. It is remarkable, considering the inclination of the authors to unite genera, that one-third of the number have but a single species each, and 100 others have no more than two. On the other hand, more than one-half of the species belong to but thirty genera, the largest of which is *Senecio*, which itself includes 900. An extended article upon the order, from the pen of Mr. Bentham, is shortly to appear in the Transactions of the Linnæan Society. There has also been recently published an English translation, by Mrs. Joseph D. Hooker, of Maout and Decaisne's authoritative work upon *Descriptive and Analytical Botany*.

Among the minor articles which have appeared may be mentioned that of Dr. W. Velten, in the *Flora*, upon the movements and structure of vegetable protoplasm; that of Dr. A. W. Eichler, in the *Botanische Zeitung*, upon the structure of the flowers of *Canna;* and that of Trecul, upon the theory of the carpels in *Papaveraceæ*. In systematic botany, J. G. Baker has given in the journal of the Linnæan Society a revision of the *scilleæ* and *chlorogaleæ*, which include the "soap-plants" of California as the only American representatives, and Rev. W. J. Berkeley continues in *Grevillea* his notices of North American *fungi*.

The recent increase in the price of coal in England has induced a considerable effort in the way of economizing the old forms of fuel and devising new; and Mr. Siemens has lately shown that by means of a form of apparatus devised by him, known as the regenerative furnace, peat and

Digitized by Google

other combustibles may be burned to excellent advantage, so as to replace, more or less, in many cases, coal itself. A new form of gas, invented by Mr. Ruck, of England, has also been announced as of great promise. In this, by a simple treatment, claimed to be inexpensive, a gas is obtained which produces an intense heat, and if previously passed through any form of petroleum, will take up enough of this substance to yield a brilliant light.

The practicability and economic features of the oxyhydrogen light of Tessié du Mothay still continue to afford matter for discussion, the result of which is, thus far, the expression of widely different opinions.

M. Blanc, in giving a *résumé* of his observations upon the process as experimented upon in Paris, expresses himself very unfavorably as to its practicability as a street illuminant. He questions the value of the manganate process for obtaining the oxygen, and asserts that, as a street illuminant, the complicated nature of the plan involves too many disturbing causes to permit of its successful use. Finally, he asserts that the experiments upon the boulevards have shown that the process is not economical.

On the other hand, a report of M. Schiele, a distinguished gas expert of Frankfort-on-the-Main, takes a very different view of the subject. The opinion is declared that recent trials of the plan, conducted in Vienna, have proven it to be quite as economical as other plans of illumination, and, in addition, that its practicability for lighting towns and even large cities has been abundantly verified. Upon one point, however, all observers seem to agree, viz., that for the interior illumination of large buildings the oxygen system is eminently well adapted.

The great interest which is at present manifested in the question of securing some more efficient means of controlling the movement of railway trains than is afforded by the ordinary hand brakes is a matter of congratulation. Of the several forms of automatic brakes which are just now the subject of inquiry and experiment by railroad managers, the Westinghouse air and the Smith vacuum brakes have, until within a short time, had the field entirely to themselves. Quite lately, however, an improvement upon the Westinghouse brake has been proposed. The essential difference between the old and the new devices lies in the fact that while the former employs pressure to apply the brake, the latter uses it to free the brake.

With the new apparatus the normal condition of the train is with all the brakes applied by the action of springs. To start and keep the train in motion the engineer lets on the pressure, which releases the wheels by detaching the springs. To apply the brake a portion of the condensed air is permitted to escape, when the action of the springs brings the brake to bear upon the wheels.

The advantage claimed for the new device lies in this fact: With other forms of automatic brakes a defect in the proper working of the apparatus may be observed only when the attempt is made to stop the train, and this knowledge may prove of no avail to avert disaster. With the new contrivance a defect in the proper working of the apparatus will be instantly manifest to the engineer, since it must, by applying the brake more or less strongly, either perceptibly retard the motion of the train, or bring it entirely to rest.

The introduction of automatic brakes upon American railroads is becoming quite general, and the example is being followed abroad, the recent very successful trials of the Westinghouse brake upon certain English roads having afforded considerable food for discussion in the English technical papers; while at the recent meeting of the American Railway Master Mechanics' Association, where the subject received a good share of attention, the opinion was unanimously concurred in that though none of the devices thus far designed were entirely free from objection, they were still, in view of the security and certainty with which they permitted the trains to be controlled, infinitely to be preferred to the old form of hand brake.

Apropos of the subject of securing additional safety in railway travel, we learn that the Franklin Institute at its last meeting confirmed the recommendation of its Committee on Science and the Arts awarding the John Scott medal to William Wharton, Jun., for his invention of the well-known safety switch which bears his name.

In the department of *Mining and Metallurgy* there are several noteworthy items.

The impetus given to iron-producing interests of the country, popularly ascribed to the growing scarcity of coal and the working-men's strikes in England, is very marked, even though the time within which these favorable circumstances have been in operation has been comparatively brief. The present status of this important industry will best appear from the figures presented in the annual report of the secretary of the American Pig-iron Manufacturers' Association.

From this it appears that the make of iron during the year 1872 amounted to 2,388,250 tons, divided as follows: Anthracite, 1,197,010 tons; raw bituminous and coke, 712,500; charcoal, 478,500. During the year 109 furnaces were erected and thirty-nine projected; forty-three rolling-mills were built and eleven projected; showing a total of 199 new establishments.

There were consumed in the country during the past year 4,054,618 tons of iron, including 400,000 tons of American scrap. Of this consumption one-tenth was American scrap, three-tenths imported iron, and six-tenths American pig. Its application was as follows: In castings, 1,103,000 tons; in railroad supplies, 2,479,500 tons; and in other wrought iron products, 730,000 tons.

The report places the number of Bessemer works in operation in the country at five, and announces that four more are in process of erection. Since the appearance of the report one of the latter (at Joliet, Illinois) has commenced operations.

Work upon the East River bridge is progressing rapidly. Masonry gangs are at work on the piers. Work has also been begun upon the new bridge between New York and Brooklyn. According to specifications, the new structure commences on the New York side at Seventy-seventh Street and Third Avenue, running parallel with the former street on its south side, over the west channel of the East River, across Blackwell's Island, and thence over the east channel of the river to First Avenue, at Franklin Avenue, on

the Long Island side. The bridge is designed to be 9500 feet in length, and to have an elevation over the East River so as to give a clear space of 135 feet above high-water. Workmen have already broken ground at Long Island City for the foundation and retaining walls of the east tower.

There is every prospect that the Hoosac Tunnel will be completed before the close of the next year. But half a mile of the mountain remains to be penetrated.

The Union Railroad Tunnel beneath Baltimore, it is announced, will be completed and in condition for operation before the end of June.

The list of deaths in the ranks of science since our last is not very extensive, but embraces at least one name of great eminence, namely, that of Baron Justus Liebig, who died, at the age of seventy, in April last. The death of Mr. Julius Branchley, a well-known English scientific gentleman, is also announced by the London papers. In our own country we have to regret the loss of Dr. John C. Nott, a prominent writer on ethnology, and Mr. George Gibbs, who has for a long time been one of the leading philologists and ethnologists of America, and especially in reference to the American Indians. His valuable library of manuscripts and vocabularies has been bequeathed to the Smithsonian Institution.

NITRITE OF AMYL.

Among the recent additions to the *materia medica* which promise to be of value in the treatment of disease, one of the most interesting is the nitrite of amyl, one of the numerous products of coal-tar. If four or five drops of this substance be sprinkled on a handkerchief and inhaled, a sensation of great fullness of the head is experienced, accompanied by a pricking of the skin and redness of the face and ears, and if continued for any considerable time, consciousness is lost for a season. It is said, however, that this application will prevent a threatened attack of an epileptic fit, if the patient is sufficiently aware of its approach to apply the remedy in time. It is also asserted to be very serviceable in preventing attacks of asthma consequent upon heart-disease, and even of angina pectoris, stopping both at once, and possibly tending to reduce the violence and frequency of the attacks.

Its secondary effects are considered not at all injurious, and the dose of four drops is said to be perfectly safe.

BROMIDE OF CALCIUM IN MEDICINE.

The application of the bromides in medicine has within late years increased to an enormous extent, the bromide of potassium alone being manufactured by tons and furnished at a low price, whereas years ago it was only the more wealthy who could afford to use it. The combinations of bromine usually employed are those of potassium, sodium, and ammonium, and their virtues depend principally upon the extent to which the bromine is taken into the system. This substance can not be employed by itself on account of its very acrid properties.

Quite lately Dr. William A. Hammond, the eminent specialist in diseases of the nervous system, has introduced the use of the bromide of calcium, to which he was led by noticing the much greater readiness with which it was decomposed: in fact, for this reason a solution can not be kept any length of time without becoming unserviceable. It is therefore best kept in a dry state, the solution being made from time to time as needed for administration. The dose is fifteen to thirty grains, according to the age or condition of the patient. As a hypnotic it is much preferable to the other remedies, and it has even been available in checking a powerful attack of delirium tremens. It has also been used to advantage in epilepsy, in which it has a very decided effect.

HEATED IRON IN RESUSCITATING THE DROWNED.

A case of restoration from apparent drowning has lately taken place in the city of Brussels, where a man had fallen into the water, and was only recovered after a considerable time. Dr. Joux, an eminent physician in the city, immediately initiated the necessary measures toward his restoration, and for three hours applied all the remedies that could be thought of. No evidence of life manifesting itself in this interval, Dr. Joux proceeded to apply plates of iron, heated to a white heat, to the upper parts of the body, near the more vital organs. After a short time, to the astonishment of the assistants, faint signs of breathing were observed, and in the course of half an hour the man came to life, and was finally fully restored, the only inconvenience sustained being the result of the severe cauterization which his skin necessarily underwent.

FLORA OF THE PLIOCENE OF CENTRAL FRANCE.

M. De Saporta has presented to the Academy of Sciences of Paris a very interesting communication upon the remains of plants and their foliage found buried under the eruptive ashes of an ancient volcano at Cantal, in France, during the pliocene epoch. According to Mr. Rames, who has made a special study of the geology of Cantal, the country had but a slight undulation down to the miocene period, its surface then being covered with lakes. At this epoch occurred the first basaltic eruptions, which are covered by the upper miocene, with its remains of *Amphicyon*, *Machairodus*, *Mastodon angustidens*, *Dinotherium giganteum*, *Hipparion*, etc.

Subsequently to this the relief of the land became more decided, and a soil was developed along the flanks of the new volcano, in which, during a long period of repose, the vegetation referred to in the communication was established. Afterward, however, a violent eruption occurred, accompanied by a shower of ashes mixed with water, and followed by avalanches of mud, which buried or destroyed the forests, and covered up the leaves which littered the soil, the trunks of the trees themselves sometimes being left erect, and sometimes prostrated.

It is thought that careful study of this fossil flora will throw light not only upon the contemporaneous vegetation during the epoch in question in different parts of the world, but also upon the mode of the origin of the species belonging to the present period. A striking fact is the collocation in these deposits of forms now belonging to the Canary Islands and the Mediterranean, side by side with those of Central Europe, the Caucasus, and North America. Species

yet existing in Central Europe are also found but little changed, and associated with others which have become exotics.

PRESERVATION OF UNSTABLE REMEDIES IN COMBINATION WITH EACH OTHER.

Certain substances used in the *materia medica* are extremely unstable in their combinations, and can not be kept for any length of time, either dry or in solution, without becoming entirely changed, and consequently more or less unfit for therapeutical purposes. Among these are the proto-carbonate and proto-iodide of iron, much used for certain affections. According to Tisy, a Parisian pharmaceutist, this difficulty may be remedied by mixing together powdered protoxide of iron, some carbonate or alkaline iodide, and an inert powder, the object of which is purely mechanical, and which serves to separate the molecules, and prevent their chemical reaction. These are to be inclosed in hermetically sealed capsules, such as are commonly used in medicine, and may thus be kept indefinitely. When swallowed, however, the capsule is immediately dissolved, and the liquids in the stomach, mixing with the powdered ingredients, cause their combination and consequent action.

The advantages of this mode of preparation are three: first, it replaces a very insoluble pill by a soluble capsule; second, the salt of iron does not exist in the capsule, and oxidation is therefore not possible; third, the salt of iron is presented to the stomach in a nascent state—that is to say, in the best condition for absorption and assimilation.

The same pharmaceutist prepares the iodo-bromide of iron in capsules, representing the natural association of bromine and iodine in marine productions and mineral waters. According to his statement, the bromide of iron can be taken with perfect convenience by persons who can not use the other salts of iron.

POSITION OF LIMULUS IN THE ANIMAL KINGDOM.

In an elaborate paper by Mr. Alph. Milne-Edwards upon the anatomy of the king-crab (*Limulus*), of which the American *Limulus polyphemus* is the well-known representative on our Atlantic coast, the conclusion is announced that these animals are neither arachnida modified by an aquatic life, nor crustaceans, as has been generally supposed by zoologists, but that they constitute a special type united to the arachnida by various analogies, though having certain features of the organization of crustaceans. The group was formerly abundant; at present the *Limulus* is the only living representative. The recent and fossil species have been united by Mr. Edwards into a class, under the name of *Merostomata*.

REARING OF OSTRICHES FOR THE FEATHERS.

The artificial rearing of ostriches is fast becoming a regular business, the number of establishments in South Africa, where this avocation is prosecuted, increasing continually, and causing a considerable rise in the price of young birds. In 1861 a pair of ostriches six months of age could readily be bought at the Cape of Good Hope for ten shillings English, while now a single bird a few days old is sold at £5, and one of three or four months brings £8 to £10. The trade in feathers has also shown a marked variation. Thus in 1860, 2287 pounds were exported, worth £19,201, while in 1870 29,000 pounds were worth £87,074; or, in other words, a pound of feathers in 1860 was worth £8 0*s.* 4*d.*, and in 1870 it brought only £3.

Mr. Heugh, of Aberdeen, South Africa, has a farm of 600 acres, on which seventy ostriches are inclosed, partly by stone walls four feet high, and partly by wire fencing, filled in with bushes to prevent the birds from inadvertently running against them. The first crop of feathers from fifty-four birds about fourteen months old weighed fourteen pounds, all taken from the wings.

Recent quotations of ostrich feathers in the London market (March 4) are, "for prime whites, £35 to £38 per pound; good light feminines, £10 to £15; black, £2 to £5; drabs, 15*s.* to £2 10*s.*"

ENDEMANN PROCESS OF PRESERVING MEAT.

According to Dr. Endemann, an excellent method of preserving meat consists in cutting it into thin slices, and drying in a current of warm air not exceeding 140° F. The operation should be completed in three or four hours, in which case the product is hard, and may be easily ground up in a mill, when it is in a condition fit for use. The fibrine and albumen are not coagulated, and consequently are still able to take up water, and thus expand to their natural condition. The meat powder prepared in this way has a light brownish-yellow color, a slight smell like that of roast beef, and a very pleasant taste. For making soup, two ounces are to be boiled, with the usual ingredients, in sixteen ounces of water. Such soup is much stronger than when prepared with half a pound of fresh uncut meat, as the latter does not give out its extractive material so completely after any amount of boiling.

Half a pound of this powder, if stirred into the proper quantity of water, with the addition of an egg, may be treated exactly as if it were the best fresh meat; and the fact that the fibrine and albumen in this meat powder are not coagulated renders it a valuable substance in cases of weakness, where stimulating food is required, as it is more easily digested than raw meat, while, on account of its minute subdivision, the action of the stomach is facilitated.

SOLIDIFICATION OF NITROUS OXIDE.

In a paper read by Mr. Wills before the Chemical Society of London an account is given of the process and apparatus necessary to obtain nitrous oxide in a solid state by the evaporation of the liquid. In this he states that, although the apparatus which he described was generally the most convenient, the liquid nitrous oxide will quickly become solidified if a rapid current of air be passed through it. Unlike carbonic acid, the liquefied gas can be readily preserved for some length of time in an open vessel, provided it be kept still. Liquid carbonic acid becomes solid as soon as it escapes from the vessel containing it, since the vapor tension of the carbonic snow at the time of its formation is much above the atmospheric pressure, while the vapor tension of the solid nitrous oxide is less than one atmosphere.

Editor's Historical Record.

POLITICAL.

OUR Record is closed on the 26th of May.—Bills have been passed by the New York State Legislature creating a new Board of Emigration (signed by the Governor April 26); annexing the towns of West Farms, Morrisania, and Kingsbridge, in Westchester County, to New York city (to be submitted to popular vote); the Police Justices bill, replacing the present police justices of New York city, who were elected to the office, by new judges to be nominated by the Mayor and confirmed by the Board of Aldermen (signed by the Governor May 18); the Local Option Prohibition bill, including cider and lager-beer in its provisions (vetoed by the Governor); the new Jury bill, providing that all challenges of jurors, both in civil and criminal cases, shall be tried and determined by the Court only; and an act for the summary conviction of professional thieves, burglars, pickpockets, and forgers. The Usury bill was defeated May 14. The bill for the enlargement of the Champlain Canal and improvement of Hudson River passed the Assembly May 14. The Senate, May 15, passed a bill authorizing and requiring the Governor to appoint twenty commissioners to "devise, consider, and prepare a plan of municipal government" suited to the requirements of the consolidated cities of New York and Brooklyn. The Assembly has passed a bill reducing the term during which destitute immigrants are supported by the State from five to two years, and increasing the head-tax on immigrants from $1 50 to $2 50.

The committee appointed by the New York Legislature March 11, 1873, to investigate the affairs of the Erie Railroad Company submitted its report May 15. The matter first considered in this report is the dividend declared last February, amounting to $1,663,791, the question raised being whether it was paid out of the net earnings for the year 1872, or out of borrowed money for the purpose of strengthening the credit of the company in Europe. The testimony proved so conflicting that the committee was unable to decide. It seemed certain, however, that not only this but other railroad companies were pursuing a course in this regard which, if followed up, will greatly increase their capital. It has already within a recent date led to the doubling of the nominal capital of the New York Central and of the Lake Shore roads. Some general restrictive law is necessary to prevent this practice. The liabilities of the Erie road were $120,000,000, and will be considerably increased if the double tracking and the reduction of gauge are proceeded with.

The story of the transfer of the management of the company, as narrated by the committee, forms a curious chapter. Early in 1871 James M'Henry and Bischoffsheim and Goldschmidt, of London, joined by the Heath and Raphael party—represented in the United States by Southmayd and others—determined to displace the Gould direction, then managing and controlling the Erie Railway Company. M'Henry, being largely interested in the Atlantic and Great Western road—a corporation representing $109,000,000 of stock and bonded debt, and whose affairs are currently believed to be in an insolvent condition—desired to get the control of the Erie road, upon which his own is mainly dependent for through traffic. General Sickles, it appears, was employed by the parties above named, and, having obtained leave of absence from his duties as minister to Spain, came to this country to carry out their designs. The first effort was made in the usual way, *i. e.*, by bringing suit against the Gould direction. General Sickles requested the co-operation of Attorney-General Barlow, and placed in his hands $12,000 to be disbursed in the procurement of counsel. This method proved too slow, and was abandoned in favor of one more speedy, though somewhat revolutionary. The idea was conceived of buying off the old directors. This was done, at a cost of $300,000. The old directors resigned, and a new board was elected, with General Dix as President, and S. L. M. Barlow counsel—the latter significantly being also the counsel of the Atlantic and Great Western. The expense of the transfer amounted altogether to $750,000. The bill of General Sickles for expenses, etc., amounting to about $70,000, was paid out of the Erie treasury. At a meeting of the stockholders in July, 1872, a resolution was passed instructing the Board of Directors to audit the entire account for expenditures, and then pay it. Shortly before the election of directors last July, a contract for the negotiation of $30,000,000 of consolidated bonds was entered into with Bischoffsheim and Goldschmidt. Between six and seven millions were to be sold, and $23,000,000 are reserved for conversion of old bonds. The contract extends to the year 1920, and a commission of 2¾ per cent. is to be paid on the whole amount sold or converted. This arrangement was evidently made in consideration of the services of the London brokers in effecting the revolution of the Erie board. They also speculated upon the rise in stocks which ensued. "If the principle," says the committee report, "be established that a few interested parties of stock-jobbers, having no permanent interest, can, by the corrupt use of money, or by violence, take and hold possession of a great railroad corporation, and reimburse themselves out of its treasury, it is time the matter was understood by the public."

In regard to the payment of money to influence legislation connected with the Erie Railway Company, the committee did not gain as specific testimony as was desired; "yet enough was obtained to show that the railroad companies have been in the habit of spending large sums from year to year either to secure or defeat the passage of bills."

One remarkable feature of the testimony elicited by the committee was the evidence that it has been the custom of the managers of the Erie Railway from year to year to expend large sums of money to control elections as well as to directly influence legislation. In 1868 over $1,000,000 was disbursed from the treasury for extra and legal services. Mr. Gould's testimony indicated that his operations extended into four different States.

The committee recommends "some enlightened system of general railroad legislation reg-

Public Domain, Google-digitized / http://www.hathitrust.org/access_use#pd-google

ulating the rates of transportation, prohibiting the issue of fictitious stocks, and punishing with heavy penalties the misappropriation of the funds of companies by the managers thereof, whether to their personal uses or to corruptly influence legislation affecting their interests." The committee also reported a bill regulating leases of connecting roads, and prohibiting the leasing of competing parallel lines. This bill renders the consent of three-fourths of all the stockholders of the contracting companies necessary to the validity of a lease.

The Illinois Legislature was adjourned May 6. Out of 1034 bills introduced, 119 were passed. Among these was a new jury law, the most notable feature of which is the provision that the ability to read newspapers shall not disqualify a man to become a juror. Before adjournment the Legislature passed the bill to prevent extortionate charges, or unjust discrimination in charges, for transportation by railroads. It provides that the Railway and Warehouse Commissioners shall make and publish schedules fixing the reasonable maximum rates, and that these schedules shall be held to be *prima facie* evidence of the reasonableness of the rates therein fixed upon. The penalty for the first offense is fixed at not less than $1000, nor over $5000; for the second not less than $5000, nor over $10,000; for the third not less than $10,000, nor over $20,000; and for each subsequent offense, $25,000.

The Tennessee Legislature has passed a new school law. The entire permanent school fund is $2,512,500. The principal is to remain unimpaired, and the interest to be devoted exclusively to public-school purposes. The working force of the system is to consist of a State Superintendent, to be appointed by the Governor, and to hold office for two years; a County Superintendent for each county, to be elected by the County Court; and three directors for each school district. There are to be separate schools for white and colored children.

One of the most important of the laws enacted by the Legislature of Michigan, during the session recently closed, provides that "whenever any person shall be tried for murder, assault with intent to kill, or arson, and shall set up insanity as a defense, it shall be the duty of the jury to find specially whether such defendant was or was not insane;" and in case of acquittal on that ground, he shall be immediately committed to the Prison Insane Hospital, and be there detained at the pleasure of the Governor of the State. Legislation was also had concerning convicts, who are not to wear striped clothing, and who, when they desire it, are to receive education. They are to be furnished with suitable secular literature, and at their discharge are each to receive a suit of clothes and $10, besides such money as may have been accumulated by working overtime.

The Shipping act of June 7, 1872, has two features obnoxious to the keepers of sailors' boarding-houses. These are the provisions: first, that all seamen shall be shipped before the United States Shipping Commissioner; and second, that they shall receive their wages themselves. Accordingly the landlords in New York city have organized an association of 127 members to defeat these provisions. By their intimidations they have prevented the shipping of sailors under the law, thus materially interfering with commerce. At one time as many as twenty-five vessels were delayed for several days beyond their time of sailing. To meet this opposition, Commissioner Duncan, April 25, went before the Grand Jury and made a charge of conspiracy against the boarding-house keepers, and obtained bills of indictment against 128 of them.

An official account of the massacre at Colfax, in Grant Parish, Louisiana, reports that ninety-four negroes were killed and twelve wounded. A telegram from Governor Kellogg to the United States Attorney-General, dated April 21, stated that with the exception of four or five parishes quiet was restored, and that the State taxes were being rapidly collected. The Governor has issued an address to the people of the State, announcing his earnest desire to establish a just and economical government, to restore public credit, and to reduce the present taxation; and he appeals to all good citizens to support him in the execution of the laws. There was early in May a serious difficulty at Martinsville, St. Martin's Parish. The Metropolitan Police sent to install Governor Kellogg's officers came into conflict with a party of insurgents commanded by Captain De Blanc. There was some fighting, and United States troops had to be called into the field. De Blanc's force surrendered. The President issued a proclamation, May 22, commanding turbulent and disorderly persons in Louisiana to disperse and retire peaceably to their respective abodes within twenty days. The proclamation is a warning that the military force of the United States will interfere, if necessary, to preserve order in the State.

The Ohio State Republican Convention at Columbus, Ohio, May 21, renominated E. T. Noyes for Governor. Among the resolutions adopted was one against the improper and arbitrary use of the growing power of railroad and other corporations.

The decrease in the public debt from March 1 to May 1 was $3,891,544.

An act was passed at the late session of the General Assembly of Delaware giving married women the right to separate ownership of property, and to the control of their own earnings.

A telegram to the Secretary of War, May 23, announced that on the 18th General Mackenzie with six companies of the Fourth cavalry had crossed the Rio Grande and attacked a camp of Kickapoo and Lipon Indians. Nineteen Indians were killed.

The Mexican Congress is engaged in amending the national Constitution, introducing some very important reforms. Articles have been adopted proclaiming the separation of church and state, making marriage a civil contract, prohibiting religious bodies from owning property as corporations, and declaring the freedom of citizens from the religious oath.

By the recent action of the British Parliament the East India Company has been dissolved, after an existence of 273 years, during which it has exerted more influence upon the world's history than any other chartered company. In 1858 the government of India was formally transferred to the crown, and since that time the company has existed only for routine purposes.—The bill for the removal of the disabilities of women was

rejected by the House of Commons, April 30, by a vote of 222 to 155. This is the fourth defeat of the bill. The vote in May, 1872, stood 222 against the bill, and 143 in its favor. In 1870 the vote stood 220 against, and 94 in favor of the bill.

The seventeenth annual report of the Civil Service Commission of Great Britain indicates an ever-increasing confidence in the efficiency of the system of competitive examinations. New offices and new departments are being continually brought under its operations. The examinations have reference not merely to the scholastic qualifications of the applicants, but also to their fitness for office as the result of practical experience.

M. Goulard, French Minister of the Interior, and M. Jules Simon, Minister of Public Instruction, resigned about the middle of May. M. Casimir-Perier was appointed to succeed M. Goulard, and M. Waddington to succeed M. Simon. M. Béranger was appointed Minister of Public Works, and M. Tourton Minister of Public Worship.

The reorganization of the ministry did not seem to the Right sufficiently conservative, and it soon became evident that there would be a sharp division of the Assembly, involving a test of confidence in the Thiers administration. President Thiers precipitated the crisis himself by urging the definitive establishment of the republic in his address on the 24th. He had no choice but to do this, a categorical interpellation of the government having been presented by the Right, rendering it necessary for the President to explain the policy of the new ministry. After the President's speech an order of the day was presented by the Right, declaring that the present form of government was not under discussion, and regretting that the reconstruction of the ministry did not afford conservative guarantees, and was adopted—360 to 344. The ministers during the recess offered their resignations to M. Thiers, who accepted them. The President also sent in his resignation, which was accepted by the Assembly. Marshal M'Mahon was then elected President, receiving 390 votes.

The Upper House of the Prussian Diet, May 1, passed the bill for the regulation and control of the clergy by a large majority. The bill defines and limits the rights of the clergy, or gives to the Minister of Education unconditional control. Only Germans are to hold ecclesiastical offices, and appointments to these must be confirmed by the government. Theological seminaries are to be under the supervision of the government, and the teachers must be Germans. A royal court is established for ecclesiastical cases.

In the Italian Parliament the members of the Chamber of Deputies commenced debate on the Religious Corporations bill early in May. The bill suppresses religious orders. The total amount of property affected by the bill is estimated to be $1,943,575. The net yearly income which will pass into the hands of the state for investment will be $1,438,526. Church lands may be leased out to tenants or sold by public auction, and the proceeds will be sunk in the Italian state rentes. The principle of the bill applies to movable property also, and church plate, pictures, and libraries may come under the auctioneer's hammer. The Vatican Library and Museum are left in the temporary custody of the Pope. Forty-seven religious houses, in which the heads of monastic orders are resident, are exempted from the provisions of the bill; but they can not increase the number of their inmates, or amalgamate with other associations, or alter the disposition of their funds. Signor Venosta, Minister of Foreign Affairs, made a speech in advocacy of the bill May 9. On the 10th there was a riotous popular demonstration in favor of the bill.

The Permanent Committee appointed by the last Spanish Cortes to remain in Madrid until the meeting of the Constituent Cortes, and to act in concert with the ministry, was dissolved April 24, owing to a disagreement with the members of the government. The elections for members of the Constituent Cortes, May 10 and 11, resulted in the choice of 310 ministerial federalists, 30 extreme radicals, 8 internationalists, 10 independent republicans, and 30 monarchists.

The International Exposition at Vienna was opened on the 1st of May. There was an assemblage present numbering from 30,000 to 40,000. The Exposition was opened by the Emperor Francis Joseph. The American department was empty, owing to the mismanagement of the United States Commissioners. The latter have been suspended by President Grant, who has appointed a new commission, with Mr. Jackson S. Schultz at its head.

The English settlements in Guinea, on the west coast of Africa, appear to have as much trouble with the Ashantees as our government has with rebellious Apaches and Modocs. Cape Coast Castle is the capital of the English settlements, situated on the Atlantic sea-board, about five degrees north of the equator. It is a fortified position, with a population of 10,000 blacks and about 200 whites, exclusive of the garrison. In its vicinity are the Fantee tribes, allies of the whites against the Ashantees. Recently the Dutch settlements on the coast have been transferred to British rule. The Dutch factories sold rum and ammunition to the Ashantees; now these supplies are cut off, the English refusing to sell these articles. Hence the outbreak, which commenced last March. The Ashantees brought 30,000 warriors into the field. They were met by about an equal number of Fantees. A battle was fought in which the Ashantees lost 2000 men and the Fantees 1000, the latter being compelled to retreat for want of ammunition. The English towns on the sea-board are protected by the British navy.

Sir Bartle Frere's mission to Zanzibar, having for its object the suppression of the slave-trade on the eastern coast of Africa, seems to have proved a failure. His special mission was to secure from the Sultan of Zanzibar a new treaty, whereby the transportation of slaves by sea from one part of his dominions to another should be abolished. Such transportation, within certain defined limits, was sanctioned by the treaty between England and Zanzibar, dated October 25, 1845. This treaty confined the slave-trade to the requirements of Zanzibar and the adjacent islands, and to and from certain portions of the main-land. But, owing to the apathy of the British government, it was carried on to an enormous extent beyond the legalized boundary. Annually 20,000 negroes from the interior of Africa were kidnaped and made the victims of

this infamous traffic. Sir Bartle Frere's negotiations to secure the abrogation of the permissive clause in the old treaty seemed at first to promise success. But the Sultan finally, influenced, it is reported, by the French consul, refused to accede to the proposed modification of the treaty. The Arab residents, who represent the chief business interests of the island, are opposed to the objects of the English mission. If the Sultan persists in his opposition, the suppression of the slave-trade can only be effected by a large increase of the English squadron in the Eastern seas, and the process would prove a very costly one.

LABOR.

The dullness of the spring season has prevented the repetition of the strikes in certain trades, of which there was so much apprehension. The horseshoers in New York city have struck, and have to a large extent succeeded. The shoemakers, in the same city, have obtained a more signal success. In Rhode Island there has been a strike among the mill-operatives to secure a reduction of the hours of labor from eleven to ten. It was not sufficiently general to be successful.

The new scheme of industrial association known as co-operation has steadily grown into popular favor in England. It constitutes an entire and every way rational settlement of the wages question, and thus avoids the strikes and lock-outs that so frequently embarrass industry. Both parties in England have looked with favor upon co-operation. The town of Rochdale, where Mr. Bright resides, furnishes a brilliant example of the success of this principle. The society at Rochdale has erected a magnificent building, costing $66,800—the institution including a news-room, library, meeting hall, and shops. In addition to this central establishment there are thirteen branches. At eleven of these branches butcher's-meat is sold; at six drapery goods; and at three clogging and shoe-making are carried on. The premises at ten of the branches belong to the society, and have been erected at a cost of upward of $70,000, including fixtures. Close to the river, and in a central part of the town, are the society's manufacturing departments, newly arranged and rebuilt, comprising tobacco manufacturing; bread, biscuit, and cake baking; the industries of pork butchering, currant clearing, coffee roasting, coffee and pepper grinding; and in the same yard are the stables and slaughter-houses—the whole being so arranged that the produce of each department can be delivered at the shops when wanted with the precision of a machine. The business of the society was $6,675,000 and upward last year, and is still increasing. The members numbered at Christmas 6444. Taking into account the number of members and the business transacted, the society must constitute at least a third part of the town, which in the lately extended district numbers 65,000 inhabitants. Its share capital is $665,000, reserve fund, $8750, and loan capital, $53,750—making together, $727,500. This is appropriated as follows: To carrying on the business (including business premises, machinery, and investments, as shares in various societies, industrial, provident, and joint-stock companies), $145,000, and to loan investments in similar associations, $225,000; land and cottage buildings, $110,000; let out to members on building security, $17,500. The society owns more than 120 cottages, bringing in a gross rental of over $7500 per annum.

As early as 1796 there was an attempt made to establish co-operative stores. The Rochdale society has been in operation for over twenty years. In less than four years the federation of fifty-four societies into the "North of England Co-operative Wholesale Society," with a capital of less than £1000, has grown to 466 in number, with an aggregate capital of £29,000, doing business amounting to £1,500,000 per annum, yielding a net profit of 4½ per cent. after paying interest on shares and loans. The wholesale society absorbs the surplus cash of the subordinate societies, paying for its use 5 per cent. interest, thus constituting a co-operative banking institution. And to render the system more complete in this particular, in future bills for merchandise to the sub-societies will be charged against their deposit accounts, and interest computed on balances. Hereafter merchandise required from America, Holland, and Ireland will be imported by the society direct. The society has also resolved to engage in co-operative manufacturing. It is ascertained that the requirements of 146 retail associations supplied by the society aggregate in cloths $700,000; boots and shoes, $200,000; tailoring, $100,000; and blankets, $20,000. The Board of Control was authorized to open a separate wholesale cloth warehouse, to go into the manufacture of boots and shoes, to establish a blanket and flannel factory, and to purchase a bakery in Manchester.

In April, at Newcastle-upon-Tyne, was held the fifth annual congress of the co-operative societies. It was held on the same day that the great mining demonstration was made on Newcastle Moor, where over 200,000 persons gathered in support of manhood suffrage. The congress devoted much of its time to the discussion of the manner of dividing profits.

The principle of concert in selling provisions is now largely applied to manufactures and mining. There are no less than eight cotton-mills started in Oldham professing to be co-operative. There are corn-mills, iron-works, engine-works (as at Ouseburn), collieries, and other projects of co-operative production in operation. There is a bill before Parliament, introduced by Mr. Hughes, to enable co-operative societies to engage in banking.

In France trades-unionism is very largely adopting the principle of co-operation. In Paris, early in 1873, the Journeymen Tailors' Syndical Chamber formed two co-operative societies. The brass founders have established another; and there is a Syndical Union Banking Society. Three-quarters of the funds are to be issued as loans to working-men's associations. Co-operative baking is carried on in many of the provincial towns.

One of the most important features connected with the order of the Patrons of Husbandry in this country is the adoption of the co-operative principle.

TRANSPORTATION.

A convention of producers and consumers was held at the Astor House, New York city, May 6, to organize an association for the purpose of

securing cheap transportation. The temporary organization was formed by the choice of Mr. R. H. Ferguson, of Troy, as chairman. Committees on credentials and on permanent organization were appointed. The draft of a constitution was submitted, providing that the name of the association should be the "National Cheap Transportation Association;" that its objects should be to promote and extend the usefulness of the various organizations that have been created to secure cheap transportation, and to enable those bodies to act harmoniously; that the association should consist of two delegates at large from each State and Territory, and one delegate from each Congressional District, to be elected by the various State organizations. The Hon. Josiah Quincy, of Boston, was chosen President, and R. H. Ferguson, Secretary. A platform of resolutions was adopted, the most significant of which declared that "the duty of the hour and the mission of this association is to obtain from Congress and the several State Legislatures such legislation as may be necessary to control and limit by law, within proper constitutional and legitimate limits, the rates and charges of existing lines of transportation; to increase, where practicable, the capacity of our present water-ways, and to add such new avenues, whether water or rail, as our immensely increased internal commerce demands, so that the producer may be fairly rewarded for his honest toil, the consumer have cheap products, and our almost limitless supplies find foreign markets at rates to compete with the world." After the adoption of the resolutions, and the appointment of a committee to draft an address to the public, the convention adjourned, to meet in Washington in January, 1874.

The convention of Congressmen, Governors, and others interested in Western interests met at St. Louis May 13. There were present ninety-one Senators and Representatives, of whom one-half were from the Northwest; but they took very little active part in the proceedings of the convention. Mayor Brown, of St. Louis, presided, and speeches were made by Henry T. Blow, Governor Woodson, and others. The principal object of the speakers seemed to be the exposition of the interests of Missouri. The resolutions adopted demand the improvement of the Mississippi River in all its tributaries and at its mouth; the opening of every practicable water route to the Gulf, the Atlantic Ocean, and to the Great Lakes, which can be opened and made safe and convenient at reasonable cost, when compared with the benefits to result from it; the prevention of such bridges as interfere with navigation; the removal of restrictions upon the purchase or registry of foreign-built ships; and the change of duties which are supposed to make iron more costly. After the convention was closed, its members took an excursion trip to New Orleans.

The convention of Governors to consider the policy of constructing a canal to connect the Mississippi with the Atlantic met at Atlanta May 20, and was organized by the election of Governor J. C. Brown, of Tennessee, for President. Only two Governors were present, and the convention, except in its local bearings, was not a success.

The select committee on transportation, which was authorized to sit during recess, and of which Senator Windom is chairman, has decided upon a plan of investigation, which is embraced in the following general divisions: first, the Lake and St. Lawrence route; second, the Lake Erie Canal and Hudson River route; third, the James River and Kanawha Canal route, embracing improvements of Kanawha and Ohio rivers; fourth, the proposed Georgia Canal route; fifth, the Mississippi and Gulf route; sixth, the various railroad routes from the interior to the coast.

The friends of State management of railroads gained an important point in the Lower House of the Massachusetts Legislature May 20. By a vote of 133 to 90 the minority report on the Hoosac Tunnel question, providing for the State management of the tunnel and the roads connected with it, was substituted for the majority report, providing for consolidation of the various roads under one private corporation.

In connection with the solution of the problem of cheap transportation there is nothing which promises more satisfactory results than an all-freight double-track railroad from the Mississippi Valley to the Atlantic sea-board. The passenger transportation, having the right of way, imposes continual and embarrassing limitations upon that of freight. The Chicago *Evening Journal* estimates the cost of an all-freight double-track road from Chicago to New York at about $45,000,000. It would afford transportation to an annual tonnage each way equal to 450,000,000 bushels of wheat, or twenty bushels a year to every dollar invested. If the saving in the cost of through freight were only five cents per bushel, the road would pay for itself in one year. With a careful system of signals, trains could be run at short intervals, at a slow rate of speed, and yet far more rapidly than even the introduction of steam will enable canal-boats to be carried. Mr. J. Edgar Thompson, the president of the Pennsylvania Railroad, in his last annual report, announces that the Alleghany Valley Railroad Company, with the assistance of the Pennsylvania Railroad Company, has already commenced the construction of a line designed especially for freight at low rates of speed, to connect the West and East. But why should not the people construct a line of their own? William Bross, in an article in the May number of the *Lakeside Monthly*, takes the ground that even if such a line were built, the freight on a bushel of corn from Chicago to New York could not be less than 17½ cents, and therefore concludes that our farming interests can expect no permanent relief from railways. Certainly the project is worthy of serious consideration.

The results of Captain Selfridge's second exploration for an interoceanic ship-canal route by way of the Atrato River appear to have been very satisfactory. Beginning on the Pacific side, the exploration followed the Napipi River to its chief tributary, the Doguado, then passing up that stream to the dividing ridge, to a point where, in crossing, a tributary of the Atrato is struck, and thence down that affluent to the main river, which is navigable thence to the Atlantic for the largest ships at all seasons of the year. By this route the entire length of the canal required for ships of deepest draught will be but twenty-eight miles, twenty-two of which will be through an almost level plain, leaving six miles of rock cut-

ting through the dividing ridge, including a tunnel under the mountain of three miles in length. To keep the cutting on each side of the dividing ridge near the surface some locks will be required, nine in all. The only serious obstacle in the way is this dividing ridge, and if it can not be got over with a ship-canal, Captain Selfridge calculates that it can be tunneled at a cost, from ocean to ocean, of seventy millions of dollars. This route has several important advantages, some of which are that there is a deep, safe, and commodious harbor on the Atlantic and on the Pacific side; that there is an abundant supply of water for the canal from the summit level at all seasons of the year; and that it is the shortest available interoceanic route, at the least cost of construction, and with the least possible amount of lockage.

INDIAN AFFAIRS.

The general orders issued by Major-General Crook, commanding the Military Department of Arizona, April 7 and 8, announced the surrender of large numbers of Indians lately hostile, and the assurance received through the tribal chiefs of their desire for a permanent peace; declared peace with these tribes on the condition that the latter should cease plundering and murdering, and remain upon their reservations; and contained instructions for the guidance of officers commanding troops stationed on the several reservations.

The Modocs have left the lava beds. On the 26th of April there was a reconnaissance made by General Gillem's command. Captain Thomas, Fourth artillery, and a party of Warm Spring Indians—seventy soldiers and fourteen Indians—marched four miles from their camps on the west side of the lava beds, when they were surprised by an ambuscade. Captain Thomas, Lieutenant A. P. Howe, Lieutenant Thomas F. Wright, and First Lieutenant Arthur Cranston were killed, and Lieutenant George M. Harris and Acting Assistant Surgeon B. Semig were seriously wounded. Thirteen enlisted men were killed and six wounded. General Jefferson C. Davis, who had been ordered to succeed General Canby, arrived at General Gillem's head-quarters May 2. During the week that followed the Modocs vacated their position. The persistency of General Davis's pursuit of Captain Jack's band has been effective in its results. On the 23d, at Fairchild's Rancho, fifteen warriors, accompanied by forty squaws and children, surrendered.

DISASTERS.

May 4.—At Dixon, Illinois, an iron bridge, crowded with an assemblage of about three hundred persons, who were witnessing the administration of the rite of baptism, broke down under its heavy burden. Seventy-five lives were known to have been lost, and thirty-two persons were more or less severely injured. The entire number of lives lost is conjectured to be between ninety and one hundred.

May 10.—Intelligence reached New York of the arrival at Bay Roberts, Newfoundland, of the steamer *Tigress*, having on board nineteen survivors of Captain Hall's arctic expedition. The party consisted of Captain Tyson, assistant navigator; Frederick Meyer, meteorologist; John Heron, steward; six seamen; William Jackson, cook; Esquimaux Joe, Hannah, and child; and Hans Christian, of Dr. Kane's expedition, with his wife and four children, the youngest only eight months old. This party, which had been landed from the *Polaris*, had been separated from the vessel by a gale which burst her moorings, October 15, 1872, in latitude 72° 35′. The *Polaris*, when last seen, was under steam and convas making for a harbor on the east side of Northumberland Island. She had no boats left. She was under the command of Captain Buddington, who had thirteen of the crew with him and a good stock of provisions. Captain C. F. Hall had died November 8, 1871, of paralysis. He had just returned from a sledge expedition. Captain Tyson's party, after drifting about on an ice-floe a distance of 1500 miles, and being nearly reduced to starvation, was picked up by the *Tigress*, April 30, 1873, in latitude 53° 35′, near Wolf Island. The *Polaris*, when left, had started for her voyage homeward. The expedition had reached the latitude of 82° 16′.

March 22.—An extensive conflagration in Hong-Kong, China. Forty-four acres of houses destroyed, and 5000 persons rendered homeless.

May 2.—Three cars of the Portland express on the Grand Trunk Railroad left the track near Soixante, Canada, and rolled down an embankment over thirty feet high. Thirty-two persons, mostly Americans, were injured.

May 5.—The palace of the Mikado of Japan, at Jeddo, was destroyed by fire. It was an immense and magnificent structure—a city within itself.

May 7.—Railway accident near Pesth, Hungary. Twenty-one persons killed and forty injured.

May 13.—In the Drummond Colliery, Westville, Nova Scotia, there was a series of fire-damp explosions, caused by the use of gunpowder in blasting. The mine was set on fire, and the single shaft through which an egress was provided was rendered useless. The number of lives known to be lost is fifty-nine. The miners had just returned to their work after a strike.

OBITUARY.

April 30.—In Washington, the Hon. James Brooks, Representative in Congress from the Sixth District of New York, in his sixty-third year.—In New York city, John R. Thompson, formerly editor of the *Southern Literary Messenger*, and more recently literary editor of the New York *Evening Post*, in his fiftieth year.

May 5.—At St. Petersburg, Russia, James L. Orr, our minister to Russia, formerly Governor of South Carolina, aged fifty-one.

May 6.—At Charlottesville, Virginia, Dr. William H. M'Guffey, Professor of Moral Philosophy at the University of Virginia.—In New York city, John Romeyn Brodhead, author of *The History of the State of New York*, aged fifty-nine.

May 7.—In New York city, Chief Justice Salmon P. Chase, in his sixty-sixth year.

May 8.—In North Easton, Massachusetts, the Hon. Oakes Ames, in his seventieth year.

April 29.—In Weston-super-Mare, England, William Charles Macready, the well-known actor, aged seventy-nine years.

May 8.—At Avignon, France, John Stuart Mill, eminent as a philosophical thinker and author, in his sixty-seventh year.

Editor's Drawer.

POETRY and advertising seem to have become blended, "as it were." Ordinary prose has ceased to have the power to invest with proper attractiveness the announcements of vendors. Great emergencies bring out great minds. Hence the necessities of the advertiser have evolved the poet. This, for example, of a tailor, who, spurning prose, "drops into poetry," like Wegg:

Oh! come into the garden, Maud,
And sit beneath the rose,
And see me prance around the beds,
Dressed in my Sunday clothes.

Oh! come and bring your uncles, Maud,
Your sisters and your aunts,
And tell them Johnson made my coat,
My waistcoat, and my pants.

Equally fanciful and suggestive is this:

Gayly young Ferguson
Bought his cigar—
Bought it at Mulligan's,
Where the best are.

When he wants fine-cut, or
Snuff for his nose,
Gayly young Ferguson
Purchases those.

More substantial, however, is the following, where the mingling of mackerel and emotion, cheese and affection, is really sweet:

Oh! say not I love you because the molasses
You purchased at Simpson's was golden and clear:
The sirup, the sugar, the jelly in glasses,
The crackers, the mack'rel, I know, were not dear.

But when you came to me with Simpson's smoked salmon,
And showed me his samples of Limburger cheese,
I felt that his claim to be cheap was not gammon:
I loved you, and said so, dear Jane, on my knees.

We are indebted to Mr. I. N. Choynski, proprietor of an antiquarian bookstore in San Francisco, for the following communication, ordering certain recondite works of a theological character. The orthography is preserved *verbatim:*

— Ill. *Apl* 13, 1872

Mr. I. N. Choynski

Sir Please Send me a catalogue of all ancient History you have for Sal also them which you do not Sel but are accuainted with— I am in search of history which relates the most inate idie of the New Testament also the old in its premature age giving the condition of the Testament in its infancy. there is two works in particular that I want. it is thus—Augustines Fauste—Boulangers life of Paul. Yours Truly, —

Any man so persistent in his wish to get at "the most inate idie of the New Testament" ought to be helped through, and Augustine and Boulanger are the fellows to do it.

In the early days of Judge R——d on the bench of the Sixteenth Judicial District of California a case came before him wherein the people were plaintiff, and it becoming necessary to get a change of venue to another county, where a jury could be obtained qualified according to law—by entire ignorance (of the case)—to try the case, the district attorney, a young and promising lawyer, advocated sending it to Amador County, while Judge Marshall, the attorney for the defense, was equally as strong an advocate for El Dorado County. Judge R——d, after patiently listening to their seemingly interminable arguments, jokingly suggested that the attorneys should retire and play a game of cribbage, twice around the board, to decide the question. Both attorneys considered themselves experts at this game, and no sooner was the suggestion made than the district attorney sung out, "I'll do it;" whereupon Judge Marshall, equally as excited, sung out, "I'll do it." They immediately retired from the court-room, while other business in the court proceeded, and were gone about fifteen minutes, when they returned. The judge thereupon put the question, "Gentlemen, have you agreed to which county your case shall be sent?"

Judge Marshall then arose, in his ponderous, dignified way, and replied, with a broad grin extending from ear to ear, "May it please your honor, you may send it to Amador."

The court was convulsed with laughter. The district attorney had beaten by two points in the game.

The Drawer is indebted for the following to a legal gentleman at Osage Mission:

At a recent term of the District Court of Neosho County, Kansas, John Stall, a regular juror, being asked, upon the selection of the jury for the trial of the case of John Cooper (Mount Vernon, Ohio) *versus* Z. A. Eaton, what, if any thing, he knew respecting the cause, replied, "I knew the plaintiff down in Indiana; he put up a mill for me; this was twenty years ago."

Whereupon the Court (Goodin, J.) perpetrated the following:

'Twas down in Injianny,
In the land of "shakes" and woe,
Where I knew the wily plaintiff,
"Just twenty years ago."

I was then engaged in milling,
Working hard through heat and snow,
When I caught the phiz of plaintiff,
"Just twenty years ago."

I hadn't *much* acquaintance;
I knew him just "so-so:"
This was down in Injianny,
"Just twenty years ago."

I haven't any prejudice;
I have told you all I know:
I bought a mill of Cooper
"Just twenty years ago."

Two for the little folk:

Little Miss V——, of this city, upon her return from a children's party, being asked if she had had a good time, replied, "Yes, but *there wasn't much boys* there."

A few Sundays since the subject of the lesson in the Sunday-school at —— was "Joseph sold into bondage." After school the mother of a little five-year-old girl asked her:

Q. "Where did Joseph find his brethren?"

A. "At Dothan."

Q. "What did his brethren say when they saw him coming across the plain?"

A. "There comes the little fool!"

An Englishman, giving in a late London journal a few reminiscences of Mr. Babbage, the man of the calculating machine, says that Mr. B. used to speak as if he hated mankind in general, England in particular, and the English government

and organ-grinders most of all. This hatred of the aggregate, combined with a love of individuals, is illustrated by an anecdote wholly unconnected with Mr. Babbage: Some time ago an Oxford don, noted for his good wine, invited to dinner the then dean and canons of Christ Church. The wine gave general satisfaction until a new kind was brought round, which all were expected to drink, but which no one seemed to appreciate. "You liked all my wines separately," said the host; "but I have now mixed them together, and you dislike the compound. Just so individually you are my best friends, but when you act collectively, you are the most detestable set of men I know."

SPEAKING of grammar, the following conversation is said to have occurred in a railroad car recently between a young lady teacher, who also writes for the ——, and an old gentleman who had a notion that he could speak the English language:

OLD GENTLEMAN. "Are there any houses building in your village?"

YOUNG LADY. "No, Sir. There is a new house being built for Mr. Smith, but it is the carpenters who are building."

GENTLEMAN. "True: I sit corrected. To be building is certainly a different thing from to be being built. And how long has Mr. Smith's house been being built?"

LADY (*looks puzzled a moment, and then answers rather abruptly*). "Nearly a year."

GENTLEMAN. "How much longer do you think it will be being built?"

LADY (*explosively*). "Don't know."

GENTLEMAN. "I should think Mr. Smith would be annoyed by its being so long being built, for the house he now occupies being old, he must leave it, and the new one being only being built, instead of being built as he expected, he can not—"

Here the gentleman perceived that the lady had disappeared.

WE had supposed that all the anecdotes of Henry Clay worth repeating had been published, but a fresh one seems to have sprung into existence, which exhibits Mr. Clay's humor in so pleasant a light that we gladly reproduce it. It is told by one Sam Long, formerly well known as a clown in the "arena." He says: "I remember once we entered Lexington in procession, and it happened that Mr. Clay was driving in at the same time. I brought up the rear of the procession, riding a mule. As he was directly behind me, I turned my face to the mule's tail, and sang out, 'Here we are, fellow-citizens, Wisdom led by Folly.' The people shouted, and Mr. Clay seemed greatly amused. Next day at the circus I made him a speech, in which I advised him to be President of the United States, and take me into his cabinet. That night he sent me a bottle of the finest wine I ever tasted, with his compliments, saying, 'From the poorest fool to the best clown in the United States.'"

BOB —— is well known about Quincy, Michigan, as a great trader, and one of the wealthiest men in the township. One day he was endeavoring to trade an old gold watch for a horse, when the party of whom he proposed to get the weather-gauge asked him how many carats fine the watch-case was. Bob, thinking to enhance its value, said he believed it was seventy-five!

"That can't be," replied the man, "for twenty-four carats is the standard for gold."

"Well, mebbe there ain't," said Bob, "but the watch has got *all the carrats they is!*"

IN April last, while the Hon. S. S. Cox was making a flying visit to the scenes of his boyhood in Ohio, he attended church, as all good Coxes do, on Sunday, and listened to a sermon from the following text, "As a servant earnestly desireth the shadow"—Job, vii. 2.

The venerable preacher began by saying he had seen a picture illustrating the text, which represented a slave looking toward the west, waiting for the end of the day's work. It was entitled, "Longing for Sunset." How he "improved" that text! He called on the worthies of both Testaments; pictured Jacob's longing for Joseph, and old Simeon's desire to go, "since his eyes were made glad." He impressed the thought that life was a struggle, and no man should desire to go. "Work was to be done. And yet we should look and long for 'sunset.' When the heart breaks, and sorrow is too painful, and suicide tempts, and the soul longs for 'sunset,' we should remember that sunset is only the vestibule of sunrise." But how he perorated! "When the river is passed, the swollen flood passed, and heaven attained, there will be unshadowed joy, for there is *no Sunset in heaven!*"

Rather rough on our Congressman!

MR. GEORGE LUNT, one of the cleverest literary men of Boston, is about to delight the general public with a volume on the peculiarities of New England life, old and new. Among other anecdotes that will grace his book is the following, of an educational character, which may be said to convey the idea of a somewhat tardy sympathy:

The girls, too, had their academy for those who aspired to something beyond the common range; and when, at a later period, I became conversant with their circle, I must say that I have never known young ladies of better manners or more cultivated minds. As an evidence of more expansive benevolence than usual, and of profounder interest in the affairs of the great world abroad, I remember that when the class of students in Goldsmith's *Ancient History* came to recitation, one young lady burst into a torrent of tears. The astonished teacher anxiously inquired into the cause of her emotion. In the midst of her sobs she ejaculated, "Oh, that good man, Socrates! To think they should have treated him so!" She was finally soothed: but, considering that the incident in question was of a rather remote date, this ebullition of feeling evinced a generous sympathy with a victim of past injustice truly worthy of a philanthropic mind.

MR. GROTE, the eminent historian, took the pleasant view of gossip and egotism when the gossiper gossiped of himself. "It is agreeable to me," he observes, "when a man talking to me will talk about himself. It is the topic which he knows most about, and which I can hardly know from any other quarter. Of course he may talk about himself in a tiresome way, or to excess; but so he may about any other topic. When a man either talks or writes his own personal experiences, you are pretty sure to learn something; and if he does not know how to make *these* interesting to hearers, he will hardly know how to make outlying matters interesting. Personally,

I dislike talking about myself; but I am rather pleased than otherwise when others in talking with me throw off that reserve. A brilliant talker like Macaulay might be expected to feel impatient of egotism in others; but those who are more content to listen than he was, will hardly share the same impatience."

THOSE who take an interest in the great subject of palindromes may find themselves rewarded by attentive perusal of the following:

1. Of a noted giant I am the name,
   And backward or forward I'm just the same.
2. Of a dull uniformity I am the name,
   And backward or forward I'm just the same.
3. Of the light of a countenance I am the name,
   And backward or forward I'm just the same.
4. Of the sun's mid-journey I am the name,
   And backward or forward I'm just the same.
5. Of the mother of mankind I am the name,
   And backward or forward I'm just the same.
6. Of a fair young Mary I was the name,
   And backward or forward I'm just the same.
7. Of what compels silence I am the name,
   And backward or forward I'm just the same.

   These initials combine: you will find they frame
   Of a son of Britain the noble name,
   A peer and statesman of fairest fame;
   And backward or forward he's still the same.

The seven words are Gog, Level, Eye, Noon, Eve, Lepel, Gag—the initials either way making Glenelg.

As a specimen of epistolary commendation we present the subjoined. Persons desirous of a simple, concise form for recommending other persons to other persons can scarcely do better than adopt it. First is the note of the applicant, followed by the indorsement. The parties reside in Virginia.

MR. ——: I understand that you are wanting overseers to attend to your farms that you have bought. I beg to inclose testimonials, and venture to hope that from my previous experience I should be of some use to you. My habits of life are such to insure regularity in the discharge of my duties, and can only assure that should you honor me with your confidence, I should spare no pains to acquit myself to your satisfaction.

I remain your obedient servant,

JAMES TERWILLIGER.

INDORSEMENT.

VIRGINIA, *January* 31, 1873.

W. B. W——, Esq.:

SIR,—I'm solicited by your friend James Terwilliger to indorse his ulogy above, which I do. His habits are temperate, his disposition congenial to social fluency in business. His comprehension of agriculture is exquisite artful. His firmness in his capacity equals his sobriety in habits. Also having never been espoused, he leads a life of celibacy. So I think all the characteristicks relative to yeomanry are centered in him.

Yours, etc.,

JETHRO ESTERBROOK.

THIS from Wisconsin:

Competition is said to be the "life of trade," and I suppose it is; but it may be carried to *extremes*, as, I think, the Drawer will admit after reading this. Having been appointed to administer on the estate of a neighbor recently deceased, I was greatly annoyed by solicitations for an order for the grave-stones for the departed. After some three or four weeks a very gentlemanly "marble man" introduced himself, told me his business, and asked for "the job." I replied that as soon as it was known that a person was dangerously ill, "a grave-stone man" made his appearance, demanded "the job," and asked for the inscription for the head-stone. He replied that he knew it was so, and added, "*I* don't do it, and I won't, for it isn't decent; but I often find myself in the same 'fix' that Deacon B—— was in."

"How was that?" I asked.

"Why," said he, "old Deacon B—— had long had his eye on Mrs. W——, whose husband had for several weeks lingered on the borders of the grave. A few days after the funeral of Brother W—— the deacon made a friendly call on the widow, and in the course of the conversation remarked that after a proper time had elapsed he proposed to offer her the consolation of his hand and heart, which he hoped would not be unacceptable to her. 'Oh, deacon,' she replied, 'you are too late: *Elder C—— spoke to me at the grave!*'"

THE negro and mule (writes a friend in Clinton, Louisiana) are inseparable companions in the Southern cotton fields, and, like the Hiawathan string and bow, useless each without the other. The lazy indifference and careless cruelty of the one, and wonderful powers of endurance of severe labor, bad treatment, and neglect of the other, complete the compatibility of the two races necessary for the production of four millions of bales. A characteristic anecdote may be relished by those who have had experience of the two. The spectator had taken refuge from the sun's perpendicular rays under the shade of a spreading beech, *sub tegmine fagi*, and lay recumbent, enjoying the fitful breezes and the sombre frothiness of the country newspaper. Along the dusty road which passed by this retreat came jogging a negro, mounted on a mule, both apparently fast asleep. As the somnolent pair approached the spot, some wicked sprite of the place gave the paper a flirt, which was no sooner seen and heard than the mule, as mules only know how, instantly "swapped ends," and leaving the negro sprawling in the dirt, took his departure, under full sail. The negro, half raising himself, and wiping the dust from eyes and mouth, watched the retreating mule for some time in silence, but at length, unconscious of an auditor, gave expression to this philosophic soliloquy:

"Dat's what makes me 'spise a mule!"

THERE lives in the city of Fall River, Massachusetts, a "tonsorial operator and capillary regenerator." He is a colored gentleman, and respectable. Entering a dry-goods store the proprietors of which had recently removed to Fall River from Maine, he thus accosted one of the firm:

"I'm told you are a Bangor man."

"Yes, Sir."

"Well, I thought so," continued the barber; "you look like a Maine man; they *all* look alike. *I came from Maine myself!*"

The member of the firm, being a very light blonde, appreciated the humor of the man of color, and smiled a little smile.

THERE are no men who in proper circumstances enjoy a hearty laugh more than do preachers. There was recently such a laugh in ——. The Publishing Committee of a large denomination held its regular meeting. It is the custom for every manuscript submitted to the committee

to be referred to two of its members, and if after examination they report approvingly, it is published; if not, it is declined. When the two members differ in opinion, the manuscript is referred to a third member, who, of course, agrees with one of the two members, and thus decides the matter. Recently the Rev. Mr. —— reported concerning a manuscript that there were in it things he liked and things he disliked, and that his position was that of the *long-eared* animal midway between two bundles of hay, and equally attracted by both. The Rev. Dr. —— said that his position was the same as that of the Rev. Mr. ——. The chairman of the committee said, "Brethren, will you appoint a third person *to pull the two asses toward one of the bundles of hay?*"

Some years ago, when horseback riding was much more common than now, two travelers were journeying through the State of ——. In passing over a stony, sterile region, with here and there a dwarfish shrub and sickly tuft of grass, they chanced to ride by a little cabin. One of the travelers said to the other, "I pity the man that lives here; he must be very poor." The occupant of the cabin overheard the remark, and came out, saying, "Gentlemen, I want you to know that I am not so poor as you think. *I don't own this land.*"

OUR LONDON SCRAP-BOOK.

THE ENGLISH SQUAW.

R. SULLIVAN, who wrote the dictionary, must have possessed a considerable fund of latent if unconscious humor. His definitions are as entertaining as Dr. Johnson's. Here are two of them: "*Woman*, the female of the human race." "*Woman-hater*, one who hates women." These definitions are simple in the extreme, and the correctness of them is unimpeachable. It may be objected that they are wanting in perspicuity, that they might be more explicit, that the definer has hardly been exhaustive in his treatment of the subjects. But, after all, what more could be said than has been said? He might have compiled whole tomes on the theme, drawing his theories from authors ancient and modern, and seeking for his examples on every continent, with result scarcely more satisfactory. How much more nearly have those arrived toward an understanding of the subject who have given their attention exclusively to the study of woman's character? How frequently are the favorite theories of such of us as advocate woman's rights overthrown by the discovery of some new trait, the exposure of some unsuspected characteristic? "Woman's wrongs" remains an initial question for our solution, and the spectacle of silent suffering, of daily submission to intolerable burdens, of love outliving systematic cruelty, of natures degraded to the condition of the savage, enduring life in the hope of affectionate intervals—these are the scenes that confound elaborate theories and rout abstruse philosophers. To such philosophers there can be no more puzzling problem submitted than that suggested by the condition of the English squaw.

The oft-repeated boast of after-dinner philanthropists of the contented and happy condition of the laborer, their warm descriptions of cleanly homes and cheerful hearths and blooming progeny, may generally be traced to the combined effects of turtle, port-wine, and national pride. We begin to treat these inevitable epigrams with scarcely more respect than is bestowed upon the vague but time-honored assertion that "Britannia rules the waves" (a privilege for which she has occasionally to pay somewhat dearly), or the sage allusions to the vast moral superiority of the English over all other nations. These patriotic effusions may be natural; but, considering that Napoleon the Great has been dead for some years, and that pigtails have gone out, and that the world generally has not been standing still, they sound somewhat silly. The truth is that the condition, social and moral, of the poor at the present moment is not only distressing, but alarming. The English squaw is no fiction. The English squaw is a stern and terrible reality. She lives in debasing serfdom, and clings affectionately to her chains. She exists at the potteries. She vegetates round the mouths of the mines. She is numerous and prolific in the manufacturing districts. But in London she swarms most abundantly. She leads a life that would kill most women, and thrives under it. From the depth of her serfdom she will point with composure to the golden souvenir of her nuptials (if haply that relic be not in pawn), and she will thank Heaven that she is not as other women are. She boasts of her ill-fed brood, and declares that she has no reason to be ashamed of them. Her husband, whose sole object in life seems to be to keep her in subjection, and to chastise her for mutiny, she loves—after a fashion. One insatiable monster pursues her—it is poverty. One sustaining spirit supports her—it is gin.

But let us take a type or two. Step with us into the precincts of Lincoln's Inn. No antiquarian spirit prompts us, nor are memories of the old locality busy with us. We will make no search for the wall in the building of which Ben Jonson is alleged to have assisted in his brick-laying days. We pass hurriedly by the numerous specimens of Inigo Jones's architecture visible on every side. The ancient mansions of dukes and earls, now converted into lawyers' chambers, shall not detain us. Nor shall we even stop to investigate the printing-

office in which Benjamin Franklin served his apprenticeship. But entering the net-work of pestiferous alleys that lies between Lincoln's Inn and Drury Lane, we will explore the wigwam of an English squaw.

This narrow lane will serve our turn. You mount three steps and enter it. It is flagged throughout, and although there has been no rain for days, the surface is wet and greasy, for down the centre of the flagging runs a brick channel, into which the refuse of the houses is thrown. A crowd of juvenile and half-naked savages have made a slide on this delightful pavement. The houses almost touch each other. The details of domestic arrangement in one house are altogether visible to opposite neighbors. Banners are hanging from the outer walls. The scraps of family linen are being dried—smoke dried. This house with open doors (the doors of all the houses are open) is of three stories and a basement, and about eight families reside in it, there being two wigwams on each floor—a primitive and unpleasant way of living.

"ONE SUSTAINING SPIRIT SUPPORTS HER—IT IS GIN."

But let us enter and see the squaw. There she stands in the middle of the domestic filth and confusion. She is about forty years of age, has a narrow forehead, and is insufficiently clad. You observe the gash on the cheek and the black contusion over the eye. You also see that pewter pot lying on the table. The gash was inflicted by that pewter pot, directed by the unerring hand of her husband. She looks vicious and discontented as she tries to clean and tidy the room. The squaw, with Herculean effort, is always cleaning, but never cleans. Two beds are rolled up in one corner; two children are fighting in another. The family live, sleep, eat, drink, and fight in this one apartment.

Dinner hour approaches—arrives. The door is flung open, and the male savage enters, calumet in mouth. He glances round the room—his brow lowers. His ways are all ungentle. He is brusque in manner. Indeed, his brusqueness is of so exaggerated a type that, were it not for the teaching of after-dinner epigrams, one might mistake it for brutality. His language is of the worst. He invariably enforces his argument by oaths, and frequently punctuates his sentences by the delivery of well-aimed projectiles. The replies of the squaw are not overrefined, and the report of the short dialogue which takes place has to be carefully sub-edited before it can be submitted to the public.

MAN. "Wy ain't my [terrible expletive] dinner ready? D'ye 'ear?"

SQUAW. "H'm."

MAN. "Oh, so yer won't answer me, won't yer, you [more terrible expletive]. D'ye think I'm a-goin' to stand like this 'ere an' not say nothin' about it?"

He knocks down the table, throws a plate on the floor, and administers a kick to one of the children. This has the effect of arousing the squaw.

SQUAW. "You jest let Tommy alone, or I'll let you 'ave it 'ot. Jest lay a 'and on 'im again, an' see if I don't."

MAN. "'It 'im? ay will I, an' 'it *you* too; so don't let's 'ave none of yer sarce, you [most terrible oath]."

Then succeeds one of those frequent and frightful scenes—a fight in the wigwam. Blows are struck, missiles are flung, screams and oaths and crying of children are heard in diabolical chorus. Furniture is disabled, black eyes are interchanged, and a small crowd collects at the door, one of the members of which sententiously and unsympa-

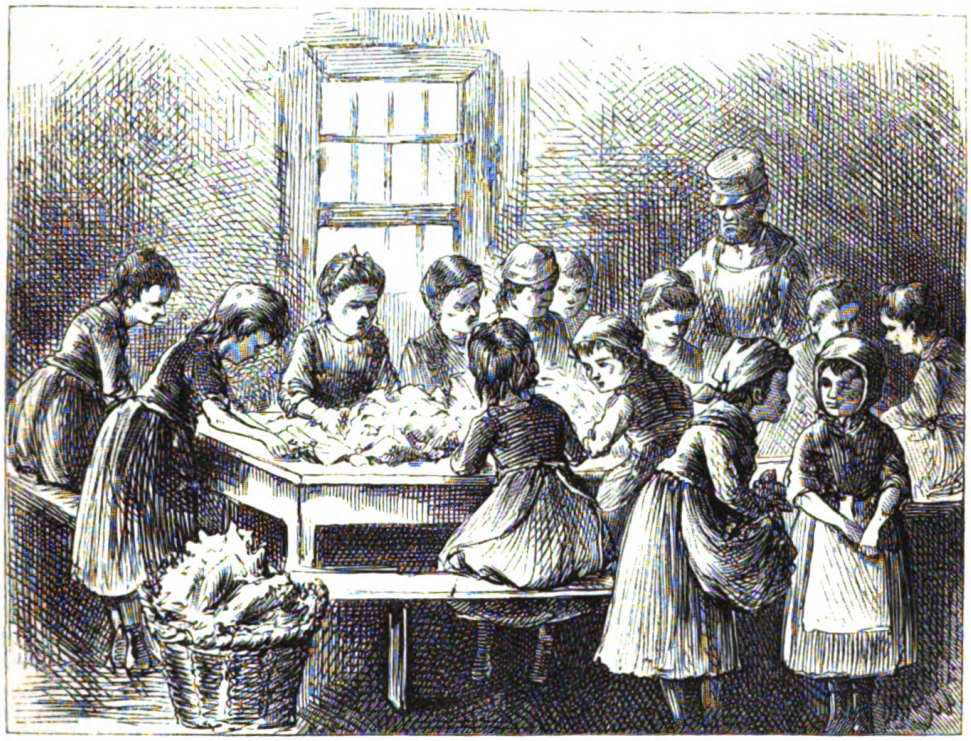
"HOLIDAY-MAKING, AS THEY CALL IT."

thetically observes, "Mr. and Mrs. Smith are at it again."

As we leave the lane we are consoled to find that philanthropic effort is not paralyzed, for a bill-poster announces that a meeting will be held to-morrow night at Exeter Hall on behalf of foreign missions. Possibly when these foreign missions shall have been successfully accomplished, those who have the direction of them may find time wherein to study the condition of certain large communities of very savage beings living upon their borders.

But let us see a squaw under less dreadful circumstances. She is holiday-making, as they call it. That is to say, her husband is holiday-making, and she is going with him to carry the basket of provisions and mind the children. They are going to spend a "happy day" in Rosherville, or Greenwich Park, or Hampstead Heath. Under these favorable conditions endeavor to form a conception of the position which the woman holds in the domestic economy, and of the point of view from which her husband regards her, and of the chances she has of "rights." There is wanting here even the savage gallantry of the wild Indian. The tone is one of cool contempt. The replies, when the condescension of a reply is granted, rough and, unless coupled with an oath, monosyllabic; the questions generally sneers, the comments generally sarcasms. While the squaw, unaccustomed to kindness, and regarding passive brutality as positive blessing, trudges on wearily, carrying the big basket with the porter and the gin and the cheese, and holding her resistful offspring to her side.

The English squaw as above presented is not intended as the description of some exceptionally unfortunate creature. A type is indicated, and not an individual—a class, and not an exception. The scene might be moved from the neighborhood of Lincoln's Inn to that of Whitechapel, or Bethnal Green, or Ratcliffe Highway, and with a similar result. Over and over again is it stated from platforms in the city that the essential difference between this nation and less favored communities may chiefly be seen in the willing and chivalrous homage accorded to women by the rougher sex. This statement is usually accompanied by quotations from Burke or Sir Walter Scott, and is much applauded. The real fact of the matter is this, that there is no human being on the face of the globe more deeply sunk in the social scale, more systematically neglected and abused, more habitually insulted, tyrannized over, and maltreated, than the English squaw.



A FIGHT IN THE WIGWAM.

HARPER'S
NEW MONTHLY MAGAZINE.

No. CCLXXIX.—AUGUST, 1873.—Vol. XLVII.

THE LITTLE LABORERS OF NEW YORK CITY.

LITTLE TOBACCO STRIPPERS.

ONE of the most touching facts to any one examining the lower strata of New York is the great number of young children toiling in factories and shops. With the children of the fortunate classes there are certain years of childhood which every parent feels ought to be freed from the burdens and responsibilities of life. The "struggle for existence," the labor of money-making, the toil for support, and all the cares and anxieties therewith, will come soon enough. And the parent is glad that the first years at least should be buoyant and free from care, with no shadow of after-life upon them. He knows how heavy the burden must be which the child will soon be forced to carry, and he is pleased that a few years can be left cheerful and happy and free from anxiety. But the father of the poor child can indulge in no such sentiments. He is compelled to harness the little one very early to the car of labor, or if he be not forced to this, he is indifferent to the child's natural growth and improvement, and believes that his boy ought to pass through the same hard experience which he had himself. He is struggling with poverty, and eager for every little addition which he can make to his income. The child's wages seem to him important, and, indeed, it requires a character of more disinterestedness and a mind of more scope of view than we usually find among the laboring class to be able to forego present profit for the future benefit of the little one. The laborer sees the daily earnings, and does not think much of the future advantages which the child may win by being educated now. The father, accordingly,

Entered according to Act of Congress, in the year 1873, by Harper and Brothers, in the Office of the Librarian of Congress, at Washington.

ENVELOPE MAKERS.

of a poor boy is found in all countries to be willing to neglect his education, if he can put him at profitable work. Neither his affection for his offspring nor his unselfishness can be relied upon as guarding his child's future. The law is forced to protect the minor.

In Great Britain the evils of this great army of infant workers had, a few years since, increased to an alarming extent. Hundreds of thousands of little ones were found growing up without any education, except the petty practical experience of the small branch of factory labor in which they were engaged, without any full development of body, their little forms bent and rickety, their countenances pale, their growth stunted by premature labor, and arriving at manhood utterly unfitted either to be citizens or the heads of new families. Vast numbers of them also died under this youthful slavery; and the mines and factories were discovered to be an immense slaughter-house for these unfortunate children. At length a band of devoted reformers and philanthropists arose, who were determined that this burning shame of their country should be wiped out, who felt that the wealth and culture of England rested on a hideous foundation when the labor of oppressed children built up the structure. They began an incessant agitation against the overlabor of factory children. They wrote for the press, printed documents, held public meetings, petitioned Parliament, and sought in every way to rouse the public feeling and conscience. They had against them the indifference of the poor parents themselves, and an enormous factory interest which made rich profits out of the toil of these unhappy children of poverty. Every where the specious arguments were brought forward that the poor themselves most of all needed the labor, that the earnings of the children supported the families of the laborers, and if these were excluded from factories they would all come upon the unions or the public almshouses. It was claimed that it was better to support the children of the laborers even by their own overwork than to keep them in poor-houses. It was urged that it was an oppression on the parents, who had brought these children into the world, not to allow them to use their earnings. The production of England would be diminished, it was said, and she would lose in the markets of the world, if this great source from children's labor were dried up. Even the education of the factory was lauded, and it was claimed that the incessant labor on one object was better for a poor child than the training it would get in the streets. To direct the manufacturer where to procure labor and where not was an interference with "freedom of trade." Capital and labor, even child's labor, should be left to natural laws.

Against all these sophistical arguments, however, the great humanity of England asserted itself. It saw it was the manifest duty of the state to guard the children of the poor and unfortunate against the greed of capital and the indifference of their own parents. It felt that these little beings were the wards of the public; that they ought not to be dwarfed in body and cramped in mind by the covetousness of others; that they had a claim on the protection of the fortunate. It was more and more seen, also, that it was not for the interest of England that a great multitude of human beings should grow up among the people ignorant in mind, weakened in body, and unfit for the duties of manhood. There were "danger-

ous classes" enough in the English cities, whom no reformation or legislation could reach, without adding to them this immense mass of children, enslaved, as it were, in their early years. The interest of the state was evidently in education, even if production were diminished. A greater evil than poverty was widespread ignorance. It was clear, too, that this great class of children would produce all the more hereafter if their minds could be trained in childhood. The best condition for popular wealth is popular education. Moreover, it was not believed that the exclusion of the children from the factories would drive the families to the almshouse. There was no difficulty, evidently, in arranging half-time schools and half-time work. The one would help the other. The young laborer would be better for his school, and the young scholar for his toil.

GOLD-LEAF WORKERS.

After incessant discussion and a long contest, the English "Factory Bills" were carried through Parliament, were repeatedly amended, improved, and enlarged, until they form now a ponderous Blue-Book.

These acts have been rigorously executed, and their effects have been that hundreds of thousands of little "white slaves" have been redeemed from slavery, saved from premature toil and sickness, and that a new class of English laborers are growing up, better educated, healthier, happier, and of more value to their employers. The reform was one of the most glorious and beneficent ever carried out in Great Britain.

This terrible evil of the overwork of children was early felt in the State of Massachusetts. A great manufacturing population had concentrated there, and some of the economical conditions of the Old World were repeated. Children were found in various parts of the State enslaved to labor from their earliest years, without proper education, and weakened in bodily power. No thorough effort, however, was made to check the evil till 1866, when the Legislature passed an act "restraining the employing of children of tender years in manufacturing establishments." This was subsequently repealed, and a more thorough and stringent law passed in 1867 (Chapter 28). By this act no child under ten years of age could be employed in any manufacturing establishment in the State. Of children between the ages of ten and fifteen years no one was allowed to be thus employed unless he had attended a day school at least "three months of the year preceding," or a "half-time school" during the six months. And if this amount of education be not secured, the employer is obliged to at once dismiss the child. It is necessary also that the school should be a suitable one, and approved by the school committee of the town where the child resides. The "ten-hour provision" is also made applicable to children, and no child under fifteen can be thus employed more than sixty hours per week. If ever the "Eight-hour Act" was reasonable, it would be as applied to children, and forty-eight hours per week seems to us quite enough for any working boy or girl. The penalty for the violation of this act in Massachusetts is fifty dollars both to employer and parent.

The phraseology of the Massachusetts law does not seem as careful as would be desirable, and is not made sufficiently yielding in cases of hardship among the poor; neither is sufficient power given to the executive officer to enter manufacturing establishments, and no sufficient school certificates or forms of registration for the factory children are provided for.

THE LITTLE BURNISHERS.

It is evident, however, that, with all its defects, the law has brought about a great alleviation of the evil of children's overwork. The officer appointed for the execution of the act has been in correspondence with all the manufacturers of the State, and has visited their works. This has at once called the earnest attention of the employers of Massachusetts, who are a very intelligent and philanthropic class, to the extent of this great evil. They have immediately sought for themselves to remedy it. Some of them have established half-time schools, which they require all the children in their employ to attend; and their experience here is similar to that in England—that they secure thereby a much better class of workers. Others arrange double gangs of young operatives, so that one set may take the place of another in the factory while the latter are in school. Others, again, have founded night schools, and great numbers of the young factory laborers are trained in these. The law is considered throughout Massachusetts as having been the commencement of a great and much-needed reform.

The act passed in Rhode Island (Chapter 139) is very similar to that of Massachusetts, except that no child under twelve can be employed in any factory, and no child during the nine months of factory-work is allowed to be employed more than eleven hours per day. The penalty for the violation is only twenty dollars.

Connecticut is in advance in matters of educational reform. Her citizens early saw the terrible evil from children's overwork, and the Legislature passed acts against it as early as 1842. The final and most stringent law, however, passed on this subject in Connecticut was in 1869 (Chapter 115). This law includes agricultural as well as manufacturing labor, and it throws on the employer the responsibility of ascertaining whether the children employed have attended school the required time, or whether they are too young for labor. The rules, too, in regard to school attendance are exceedingly strict. The age at which three months' school-time is required is fourteen. The penalty for each offense is one hundred dollars.

The law, however, is defective in that it does not establish the lowest age under which a child may be employed in a factory, and does not limit the number of hours of labor per week for children in manufacturing establishments.

The manufacturers of Connecticut seem to have co-operated with the law with the utmost good sense and humanity. One of them writes to the State executive officer: "We do not dare to permit the children within and around our mills to grow up without some education. Better for us to pay the school expenses ourselves than have the children in ignorance." Others have followed the example of Massachusetts manufacturers, and have opened night schools and half-time schools for their little employés, while others have permitted the division of the children into alternate gangs, of whom one is in school while the other is in the factory.

It is difficult to obtain minute or accurate information in relation to children employed in factories in New York city, and more difficult still to gain access to the factories, owing to the reluctance of employers to admit strangers. The manufacturers naturally suspect some sinister motives on the part of the inquirers. They are jealous of one another, and desirous of keeping their various patents and modes of work secret from

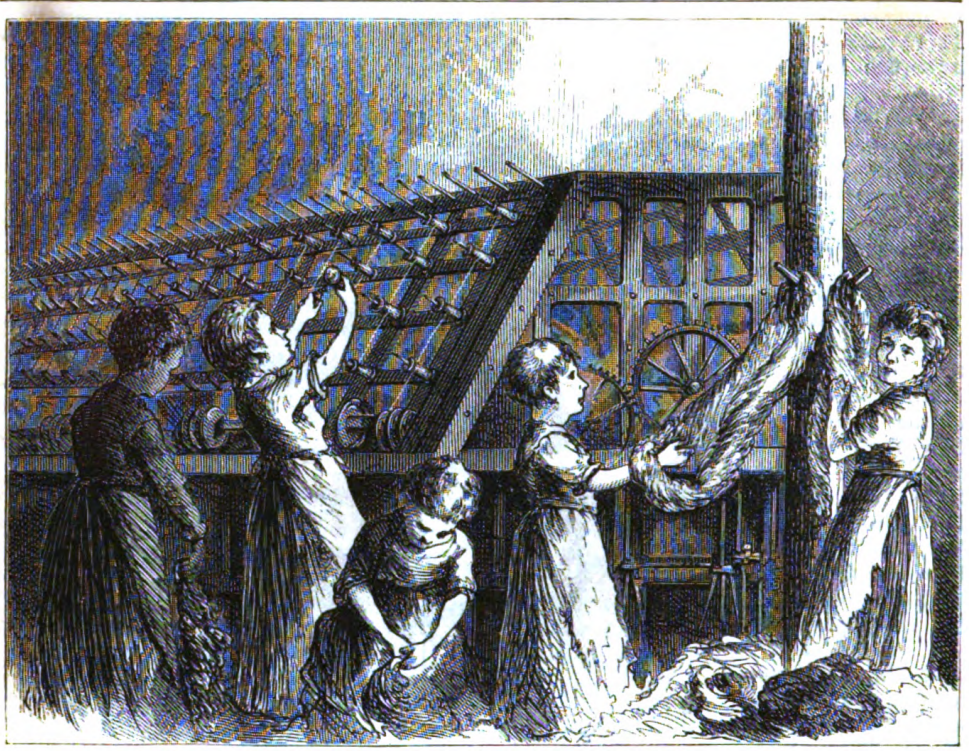
their competitors. There have been not infrequent instances of covert attempts by the members of one firm to get possession of the secrets of another, and they are consequently all somewhat suspicious of strangers making inquiries.

MAKING PAPER COLLARS.



It is estimated on trustworthy grounds that over 100,000 children are at work in the factories of New York and the neighboring districts, while from 15,000 to 20,000 are "floaters," drifting from one factory to another. Of these the envelope factories employ about 8000 children, one-quarter of whom are under fifteen years of age. The average earnings of the little workers are $3 per week. The ventilation in these factories is generally good. The gold-leaf factories employ a large number of children, though the exact statistics of the number can not be given. This occupation requires much skill and delicacy of touch; it is not severe, but demands constant attention. The outside air is carefully excluded from these factories, owing to the fragile nature of the material used. The girls employed are mostly over fifteen years of age. The burnishing of gold, silver, and china-ware is mostly done by girls, some of whom are under thirteen years of age. Singularly enough, it is said that men in this business require to wear breastplates, in order to prevent injury from the steel instruments employed, while the girls who labor at it sit at long tables, their undefended breasts pressing against the handles of the frame.

MAKING PAPER BOXES.

Paper-collar factories are a very important branch of

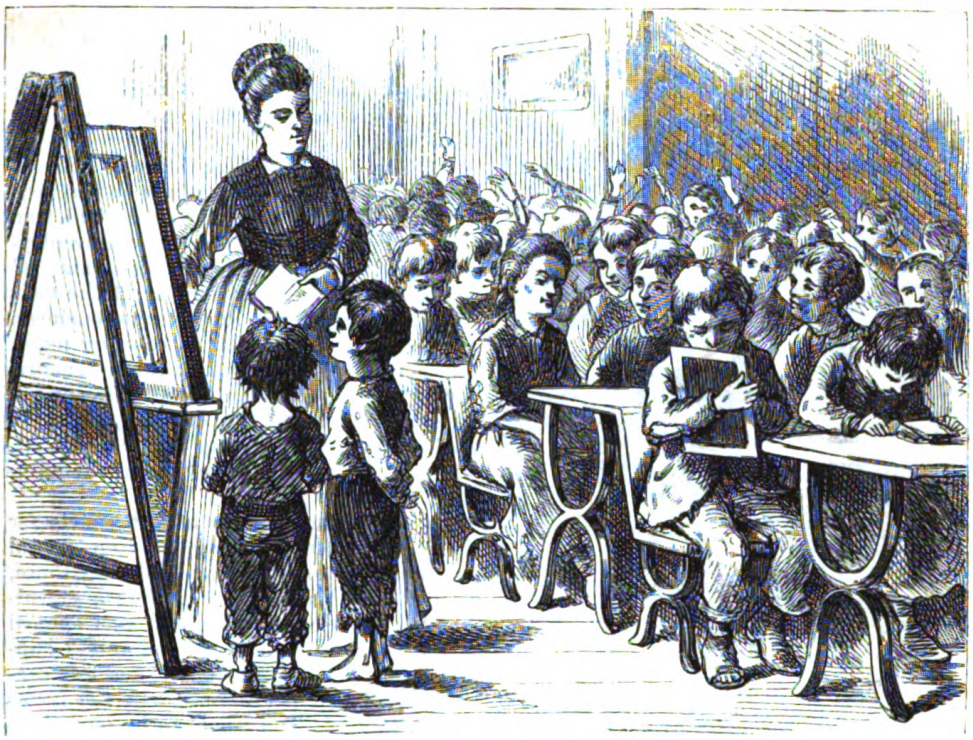
TWINE MAKERS.



children's labor. Fully 8000 girls from twelve to sixteen years of age are employed in it. A girl can count and box 18,000 collars in a day of ten hours.

Paper-box factories, embracing all sorts and sizes, from a match to a work box, employ at least 10,000 children. These become very expert, and often invent new patterns. The material being cheap, the children are permitted to take home enough to do extra work, and are thus, in fact, excluded from night school.

In regard to factories for making artificial flowers it is extremely difficult to obtain trustworthy information, as access to the shops is rigidly refused. After considerable investigation, it seems to us that from 10,000 to 12,000 children are engaged in them, of whom nearly 8000 are under twelve years of age. Many are only five and seven years old. The latter are employed preparing and cutting feathers for coloring. Employers claim this to be a healthy business, but, judging from the pale and sickly countenances of the girls, we doubt the assertion.

Another important industry employing children in the city is the manufacture of tobacco. The tobacco factories contain fully 10,000 children, of whom 5000 at least are under fifteen years. The youngest child we saw employed in them was four years of age. He was engaged in stripping tobacco, and his average earnings were about one dollar per week. Many laborers work all their lives in these factories. We saw persons as old as eighty years in them. A man seventy years of age told us he had spent thirty years in one factory. His two boys had entered the factory with him at the age of ten and twelve years, and were now at work as men in the same shop. Another, the foreman, and general workshop manager, had entered that factory thirty-five years ago, when a boy ten years of age. In some of these factories boys under fifteen years are employed in dusky cellars and basements, preparing, brining, and sweetening the weed preliminary to "stemming." The under-ground life in these damp, cavernous places tends to keep the little workers stunted in body and mind. Other boys from ten to twelve years were squatting on the floors, whetting the knives of the cutting machines with a mixture of rum and water applied with a sponge. The rapidity with which the girls work is wonderful. A girl of sixteen years can put up thirteen gross of packages of chewing tobacco in tin-foil, and twenty-two gross in paper, in one day. Girls and boys from twelve to fourteen years earn in this business from four to five dollars per week. Some little girls only eight years of age earn $3 per week. The fact is that these children are often able to perform the same amount of this light labor as adults, while they only receive a portion of the pay given to older laborers. Thus the children who ought to be in school are made to deprive older laborers of their employment and remuneration.

THE NIGHT SCHOOL.

Still another branch absorbs a great number of children—the twine factories. No accurate estimate can be obtained of the number of little laborers in these, but it is known to be very large. In one up-town factory alone, 200 children, mostly girls, are employed. This work is dangerous. The "hackling machines" are generally tended by boys from ten to fifteen years of age. Their attention must be riveted on the machinery, and can not relax for a moment, or the danger to life or limb is imminent. The "twisting machines," attended to by girls, are equally dangerous. Many have lost their fingers, or joints of them, that were caught in the twine. Only great presence of mind has saved many of these girls from losing the whole hand. We knew in one instance, in a single night school in New York, five factory girls who had each lost a finger or thumb. It is evident that strict legislation is needed here, as it has been in England, to protect these young workers from dangerous machinery. The air of these twine factories is filled with floating particles of cotton and flax, and must be exceedingly unhealthful.

It will be seen from these condensed statistics what an immense population of children in this city are the little slaves of capital. How intense and wearying is their daily toil, and how much of their health and education is sacrificed in these early years and premature labor! The evil in New York is evidently enormous, and most threatening to our future. These children, stunted in body and mind, are growing up to be our voters and legislators. There are already over 60,000 persons in New York who can not read or write. These little overworked operatives will swell this ignorant throng. Fortunately this great abuse has not escaped the attention of humane men.

There is one well-known benevolent organization in New York which has been especially the friend of working children—the Children's Aid Society. This has established in various parts of the city "industrial schools," where the children of the working classes are taught habits of industry, order, and cleanliness, together with common-school lessons and some industrial branch, and are then forwarded to places in the country. Besides these well-known institutions, which contain now during the year some nine thousand children, they have also founded night schools in destitute quarters, where boys and girls who labor all day can acquire a little education at night. The eagerness of these hard-working youths after a day of severe toil to obtain the rudiments of education is one of the most pathetic experiences in the field of the society's work. In one school, the Park School, near Sixty-eighth Street, young girls and lads, who have been working from seven o'clock till six, have been known to go without their supper in order not to miss the evening lessons. The stormiest weather and the worst

SEWING-MACHINE OPERATORS.

walking do not keep them from these schools. In the various night schools of the Children's Aid Society will be found hundreds of little ones from six to thirteen who have been working very hard the whole day, and who are now just as eager to learn their little tasks. Their occupations are innumerable. Thus we learn from a recent report from one of the society's visitors that at the school at 98 Crosby Street "there were some hundred children. Their occupations were as follows: They put up insect powder, drive wagons, tend oyster saloons; are tinsmiths, engravers, office-boys; in type-foundries, at screws, in blacksmith shops; make cigars, polish, work at packing tobacco; in barber shops, at paper stands; are cash-boys, light porters, make artificial flowers, work at hair; are errand-boys, make ink, are in Singer's sewing-machine factory, and printing-offices; some post bills, some are paint scrapers, some peddlers; they pack snuff, attend poultry stands at market, in shoe stores and hat stores, tend stands, and help painters and carpenters.

"At the Fifth Ward School (No. 141 Hudson Street) were fifty boys and girls. One of them, speaking of her occupation, said: 'I work at feathers, cutting the feathers from cocks' tails. It is a very busy time now. They took in forty new hands to-day. I get three dollars and fifty cents a week. Next, I'll get more. I go to work at eight o'clock, and leave off at six. The feathers are cut from the stem, then steamed, and curled, and packed. They are sent then to Paris, but more South and West.' One boy said he worked at twisting twine; another drove a 'hoisting-horse;' another blacked boots, etc.

"At the Eleventh Ward School, foot of East Eleventh Street, there was an interesting class of boys and girls under thirteen years of age. One boy said he was employed during the day in making chains of beads, and says that a number of the boys and girls present are in the same business. Another said he worked at coloring maps. Another blows an organ for a music-teacher.

"At the Lord School, No. 207 Greenwich Street, the occupations of the girls were working in hair, stripping tobacco, crochet, folding paper collars, house-work, tending baby, putting up parcels."

Among the institutions of this society for the education of working children should not be forgotten the Girls' Lodging-House, at No. 27 St. Mark's Place. Here a gratuitous "Sewing-machine School" was opened a few years since, the manufacturers supplying machines gratuitously, and any destitute girl, whether a lodger in the house or not, can be trained here to be an "operator." It is found often that a poor half-starved girl will enter this school, and if bright in learning the business, will in three weeks go out and earn from a dollar to two dollars a day in operating on a machine. The fact is a remarkable one in an econom-

TRAINING SERVANTS.

Digitized by Google
Original from UNIVERSITY OF MICHIGAN

ical point of view, and shows that the supply of skilled machine labor is by no means equal to the demand. That such wages can be earned by utterly destitute girls, after so short a training, is one of the most hopeful signs which have ever appeared here with reference to the female working class. In this machine school, during the year, over a thousand girls are trained.

Another interesting experiment in this house is the opening of a "training school for servants." Its benevolent managers have taken pity on our housekeepers. They have remembered the troubles which every family undergoes from awkward and ignorant domestic service; the bad and unhealthy cookery, the slovenly house-cleaning, the ill-made beds, the poorly washed garments, and all the inflictions which we suffer daily from a class of workers who do not understand their business. An experiment is being made to remedy this evil by training a few young girls in this house as thorough and skillful servants. They are taught to cook a simple and nourishing breakfast in the morning; they then receive lessons in bed-making; they are next drilled in sweeping and scrubbing. They are instructed how to prepare a plain and well-cooked dinner, and a supper which a Christian may eat. On some days they are trained in laundry-work, on the sewing-machine, and in hand-sewing. The idea is an excellent one, and the experiment may result in producing a class, which is the greatest necessity in this country, of thorough-trained servants. The practical difficulty, however, will be that every housekeeper of the land is at the head of a "domestic training school," which will more than compete with this, as the lady not only trains the girl, but pays her board and wages for being trained.

THE NEWSBOY'S FIRST LESSON.

Besides this lodging-house are four other lodging-houses, for newsboys, boot-blacks, and other street lads. The best known of these is the Newsboys' Lodging-House, No. 49 Park Place, the first ever opened in any country, founded in 1854. During nineteen years it has sheltered 91,426 different boys, restored 7196 lost and missing ones to friends, provided 7108 with homes, furnished 576,493 lodgings, and 426,580 meals. The entire expense of all this, including rent, furniture, repairs, etc., has been $124,223 29, of which amount the boys have contributed $32,806 96, leaving the actual expense, over and above receipts from boys, $91,416 33, being only about $1 for each boy.

Still another is the Rivington Street Lodg-

ing-House, No. 327 Rivington Street, which has attached to it a beautiful greenhouse of flowers; a third is at No. 709 East Eleventh Street, and a fourth at No. 211 West Eighteenth Street. All these lodging-houses together shelter during the year some 12,000 homeless children.

Another ingenious effort for the benefit of the destitute children of the city is the "placing-out system," which has been carried out by the Children's Aid Society during the last twenty years with such remarkable success. The society early saw the immense benefit in taking advantage of the peculiar economical condition of this country in treating questions of pauperism. They at once recognized the fact, and resolved to make use in their plans, of the endless demand for children's labor in the Western country. The housekeeping life of a Western farmer is somewhat peculiar. The servants of the household must be members of the family, and be treated more or less as equals. It is not convenient nor agreeable for a Western matron to have a rude European peasant at the same table and in the same room with the family. She prefers a child whom she can train up in her own way. A child's labor is needed for a thousand things on a Western farm. Children, too, are valued and thought much of. The same opportunity is given to working children as to all other children. They share fully in the active and inspiring Western life. They are moulded by the social tone around them, and they grow up under the very best circumstances which can surround a poor boy or girl. No treatment which man could devise could possibly be so beneficial to the laboring children of this city as that offered by Western farms. Moreover, a child's place at the table in our rural households is of small account. Of food there is enough and an abundance. Generosity, and especially toward children, is the rule in our Western districts. This benevolent association, taking advantage of these great facts, early made arrangements for scattering such little workers of the city as were friendless and homeless all through the Western country. Western agents are employed who travel through remote farming districts, and discover where there is an especial call for children's labor. An arrangement is then made with the leading citizens of the village to receive a little detachment of these homeless children of the great city.

On a given day in New York the ragged and dirty little ones are gathered to a central office from the streets and lanes, from the industrial schools and lodging-houses of the society, are cleaned and dressed, and sent away, under charge of an experienced agent, to seek "a new home in the West." When they arrive in the village a great public meeting is held, and a committee of citizens formed to decide on the applications. Farmers come in from twenty to twenty-five miles round, looking for the "model boy" who shall do the light work of the farm and aid the wife in her endless household labor; childless mothers seek for children that shall replace those that are lost; housekeepers look for girls to train up; mechanics seek for boys for their trades; and kind-hearted men, with comfortable homes and plenty of children, think it is their duty to do something for the orphans who have no fair chance in the great city. Thus in a few hours the little colony is placed in comfortable homes. Subsequently, if changes should be necessary, the committee replace the children, or the agent revisits the village, while a steady correspondence is kept up by the central office with the employers. In this way something like 25,000 boys and girls have been placed in country homes during the past twenty years. Nearly 3000 a year are now sent forth by the society. Great numbers of these children have acquired property, or have grown up to positions of influence and respectability.

This association, not content with all these ingenious devices for the benefit of the working children, are now especially laboring to prevent the evil of overwork in factories. An act has been drawn up by their counsel, Charles E. Whitehead, Esq., and is now before the Legislature, designed for the protection of factory children. By this law no child under the age of ten years is allowed to be employed at all in a manufactory, and no child under the age of twelve, unless he can intelligibly read.

No child under the age of sixteen years is allowed to be employed more than sixty hours in one week, while four public holidays are secured to him. We think a humane amendment to this provision would have been the limiting of the day's work of children to eight hours. Other sections of a very stringent character secure to every factory child between the ages of ten and sixteen a certain proportion of education, either in night schools, half-time day schools, or by three months' annual schooling. Judicious exceptions are made in cases where a poor family is dependent on the labor of its children, in permitting such children to attend the night school instead of the usual day school.

Careful registers are required to be kept by the manufacturers or employers, showing the amount of schooling enjoyed by each child, the time of his labor in the factory, and other facts important for the execution of the law.

Humane provisions are also included in the act for the promotion of the good sanitary condition of the factories, and to protect the children from dangerous machinery.

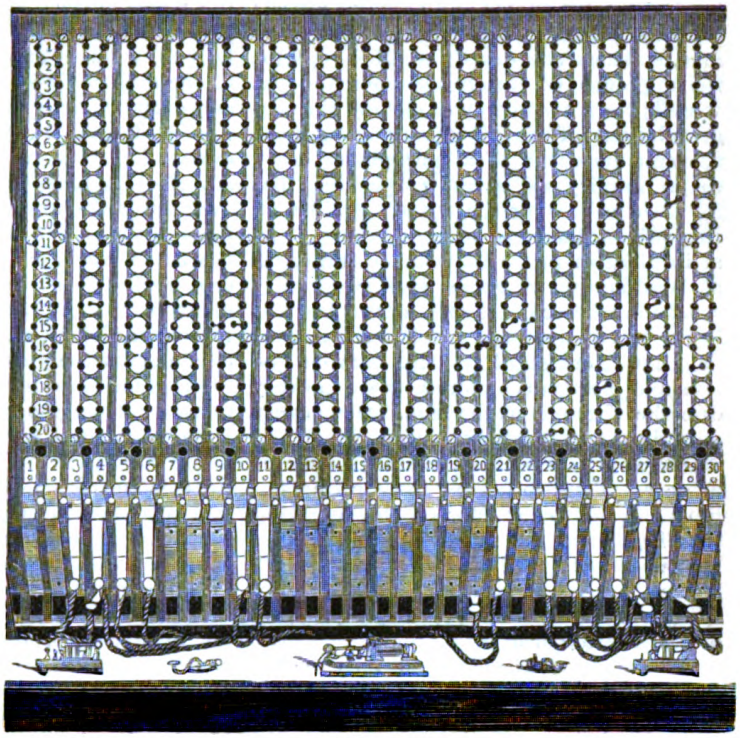
Under the proposed law a new official has to be appointed by the Governor, to be called the "Inspector of Factory Children." Such an officer, acting under so wise and humane a law, can not but accomplish immense good throughout the State.

It is a matter deeply to be regretted that certain manufacturers in the State Legislature in Albany have not imitated their more enlightened and humane contemporaries in Massachusetts, and given their hearty support to so beneficent a measure. Instead of this, we are sorry to be informed that they are offering a factious opposition which may entirely defeat this act, and put New York in a very unfavorable position, as compared with the New England States, in her legislation to protect factory children.

THE TELEGRAPH.



A TERMINAL STATION.

WHEN we look at a railroad map of the United States, with its intricate net-work of black lines, and in imagination fill it out with its double tracks, its junctions and busy stations, its dépôts and engine-houses, and then people and vivify the picture with its swarming and hurrying life and its gliding trains, ever making up, traversing the field, breaking and forming new combinations, incessantly succeeding, passing, and crossing each other; and when we add the bands of pioneers, surveyors, engineers, laborers, and construction trains which form the fringe of this net-work, constantly extending its meshes in every direction, and adding new intricacies to its most crowded parts—the mind is almost bewildered with the thought of such an immense labyrinth, such complex organization.

If we could rise above the surface of the earth, and take in the whole country at a bird's-eye view, with visual power to discern all the details, the net-work of the telegraph would be still more curious to look upon. We should see a web spun of two hundred thousand miles of wire spread over the face of the country like a cobweb on the grass, its threads connecting every important centre of population, festooning every great post-road, and marking as with a silver lining the black track of every railroad. We should observe men, like spiders, busily spinning out these lines in every direction, at the rate of five miles an hour for every working hour in the year. If we should trace these threads back from the circumference, we should find them converging from every direction to certain central knots, like Chicago, St. Louis, Cincinnati, Buffalo, Washington, and many others of equal importance, and thence running in great strands, doubling and multiplying in number as they approach the centre, but so arranged as to bind every city and town

to all its neighbors, near and far. If the eye, seeking to analyze this labyrinth, should pursue the converging lines, it would at last follow a great band of more than two hundred and fifty wires, from every point of the compass, running into one great centre in the city of New York, in the main office of the Western Union Telegraph Company. Other minor centres would appear, but this one would immediately be recognized as the great core or heart of the system.

ONE-QUARTER OF SWITCH-BOARD, WESTERN UNION OFFICE, NEW YORK CITY.

If, now, such an observer could be gifted with a magic power of vision, which man has not yet dreamed of attaining, so as to be enabled to see that unseen and silent force we call electricity, and discern its instantaneous actions and reactions from point to point over this bewildering maze, the net-work of the telegraph would present a spectacle far more amazing than that of the railroad system.

As the morning sun sends the hour of nine across the continent, the offices are filled with operators, an army of nearly ten thousand persons, engaged in the various functions involved in the service. The batteries, which we may imagine to have been mostly slumbering during the night, all awake to their work, and the quiverings and scintillations of electric action along the wires would show the whole net-work to be now alive. On the great trunk lines the last of the night work is finished, the morning orders are circulated, and around the circuit flash the humorous salutations which the operators exchange with their unseen fellows, who seem to be concealed at their elbow, but who are in reality hundreds or thousands of miles away. Ten o'clock finds the offices full of business. Outward-bound messages pour in to be dispatched, and messages received are ticked off by the talking armature, to be written out and sent off for delivery. By eleven o'clock the press news begins to crowd upon the operators, and then for two or three hours the excitement is at its height. Every one must be at his post, every faculty alert, and attention incessant. The zinc in the batteries burns fiercely under the corroding acid, the mysterious "current," which becomes more wonderful the more conscious we become of human ignorance respecting it, leaps to its work. Every available circuit on the great lines is pressed to its utmost. The operator's keys dance their tattoos, to which the distant receiving instruments instantly respond, reproducing the slightest, most transient motion. The whole net-work of wires, and the submarine cables which connect it with other equally active systems on the other side of the globe, are all quivering from end to end with signals of human intelligence.

After two o'clock signs of relaxation appear. The press messages diminish; messages that have been waiting to take their turn are cleared off. At four the heavy business of the day in many offices is about over. The great lines are still crowded, and their work runs on into the evening. At last the business of night work begins, and the press messages from Washington, and the business and social messages that are taken at half price, in consideration of their being allowed to be sent at leisure, to be delivered next morning, are transmitted between the great cities, north, south, east, and west.

Every phase of the mental activity of the country is more or less represented in this great system. The fluctuations in the markets; the price of stocks; the premium on gold; the starting of railroad trains; the sailing of ships; the arrival of passengers; orders for merchandise and manufactures of every

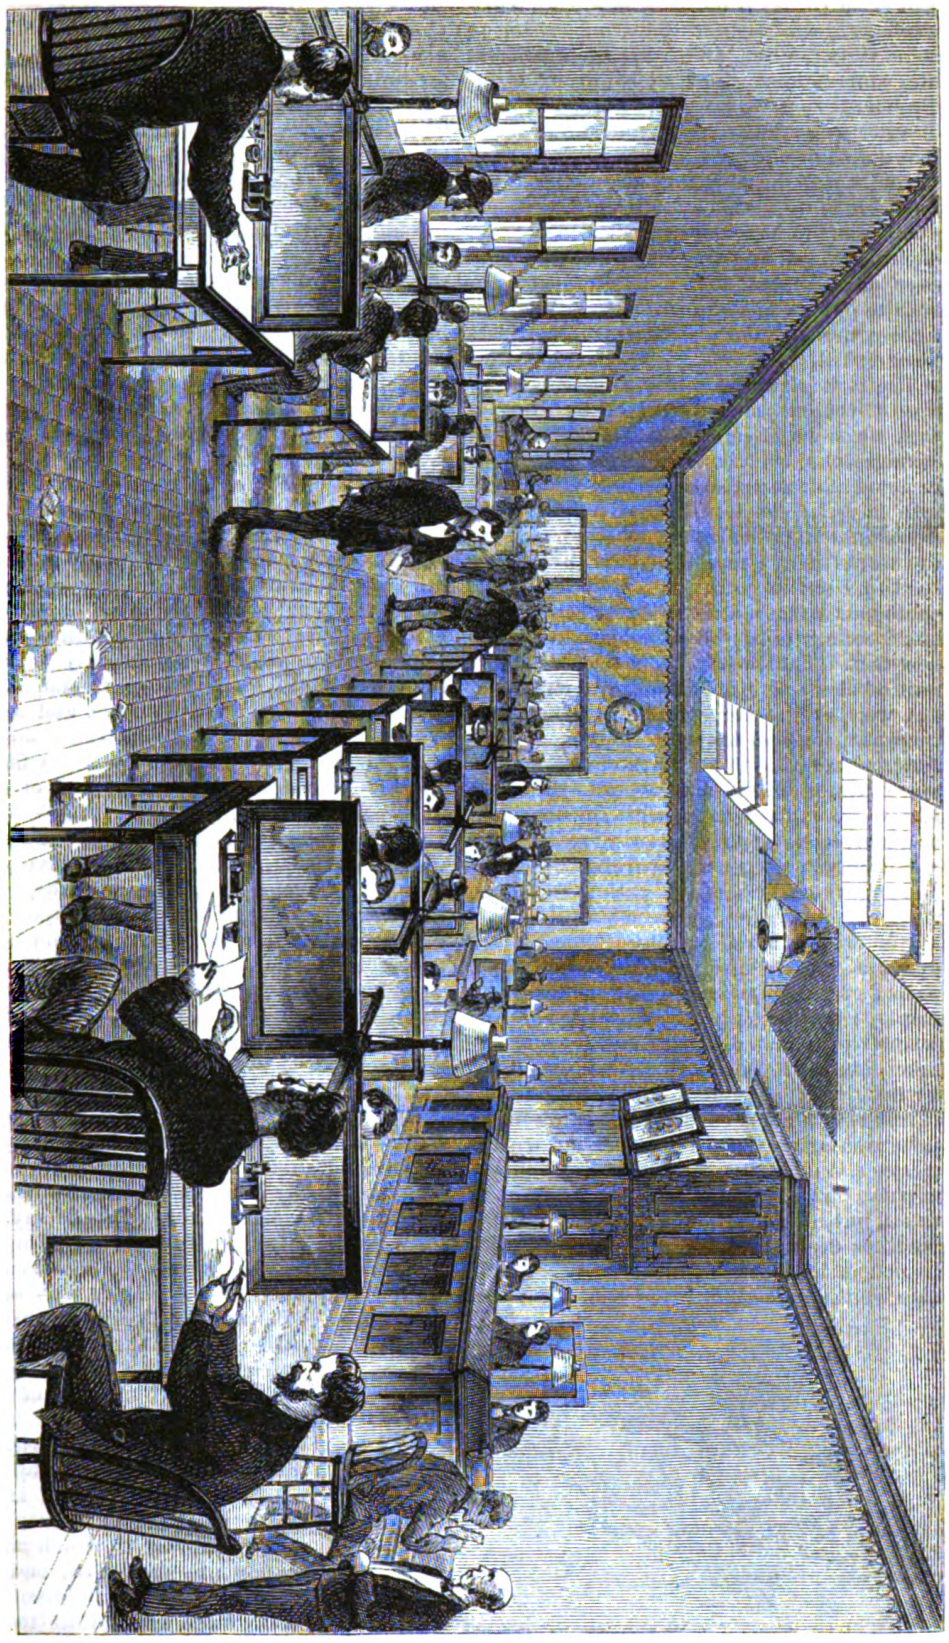
kind; bargains offered and bargains closed; sermons, lectures, and political speeches; fires, sickness, and death; weather reports; the approach of the grasshopper and the weevil; the transmission of money; the congratulations of friends—every thing, from the announcement of a new planet down to an inquiry for a lost carpet-bag, has its turn in passing the wires. Amidst all this private business perhaps some political incident of prime importance transpires at Washington, or some terrible casualty shocks Boston or Chicago. Almost instantly the knowledge of it reaches the nearest ganglion of our great artificial nervous system, and it spreads simultaneously in every direction throughout the land. Along every wire the same pulsations run, speaking their message upon all the instruments in a circuit at once. Thus, to borrow the striking figure of Scripture, quick "as the lightning that lighteneth out of the one part under heaven shineth unto the other part under heaven," an electric flash of intelligence spreads over the country, carrying a thrill of gratification or of grief.

Our observer, if he could not only see the oscillations of electric condition, but also discern the meaning of the pulsations, and read the messages as they circulate, would thus have a panorama of the business and social affairs of the country passing under his eye. But the telegraph has now become so true a representative of our life that it would hardly be necessary to read the messages in order to find an indication of the state of the country. The mere degree of activity in the business uses of the telegraph in any given direction affords an index of the prosperity of the section of country served thereby. Mr. Orton, the president of the Western Union Company, gave a striking statement of this fact in his argument before a committee of Congress in 1870. He said: "The fact is, the telegraph lives upon commerce. It is the nervous system of the commercial system. If you will sit down with me at my office for twenty minutes, I will show you what the condition of business is at any given time in any locality in the United States. After three years of careful study of the matter, I am ready to appeal to the telegraph receipts as a criterion under all circumstances. This last year the grain business in the West has been very dull; as a consequence, the receipts from telegrams from that section have fallen off twenty-five per cent. Business in the South has been gaining a little, month by month, for the last year or so; and now the telegraphic receipts from that quarter give stronger indications of returning prosperity than at any previous time since the war."



The observer, whom we have supposed capable of seeing electricity, would find that the whole surface of the earth, the atmosphere, and probably the fathomless spaces beyond, were teeming with manifestations of the electric force. Every chemical process, every change of temperature, all friction, and every blow, in nature or in art, evolves it. The great process of vegetation, and the reciprocal process of animal life, all over the globe, are accompanied by it. As incessantly as the sun's rays pass around the earth, warming every part, in alternation with the cooling influence of night, great currents or fluctuations of magnetic tension, which never cease their play, circulate about the globe, and other, apparently irregular, currents come and go, according to laws not yet understood, while the aurora borealis, flaming in the sky, indicates the measureless extent of this wonderful power, the existence of which the world has but begun to discover. Our observer would see that these great earth currents infinitely transcend the little artificial currents which men produce in their insulated wires, and that they constantly interfere with the latter, attracting or driving them from their work, and making them play truant, greatly to the vexation of the operators, and sometimes to the entire confusion of business. If a thunder-storm passed across the country, he would see all the wires sparkling with unusual excitement. When the rain fell, and water, which is a conductor, trickled along the wires, and stood in drops upon the insulators, he would see the electricity of the line deserting its path, and stealing off slyly, in greater or less quantities, over the wet surface of the insulators, or by the wet straws or kite strings that sometimes hang across the line. Now and then he might see the free electricity of the storm overleap the barriers, and take possession for the moment of some unguarded circuit, frightening operators from their posts.

Such an observer would realize, what it is difficult adequately to conceive, that electricity is, as has been said, the great hidden force in nature, and still remains, so far as man is concerned, almost dormant. A high scientific authority has remarked, in speaking of metals, that the abundance of any object in nature bears a proportion to its adaptation to the service of man. If this be true in general, we may expect that electricity will become one day a most familiar thing.

With the exception of those general readers whose taste or course of reading has led them somewhat into scientific paths, there are not many persons who find it easy to form a definite idea of the precise mode of action by which a telegraphic wire conveys its messages—so multitudinous and varied in their character, and transmitted with such inconceivable rapidity.

We are, it is true, most of us somewhat farther advanced in our ideas on the sub-

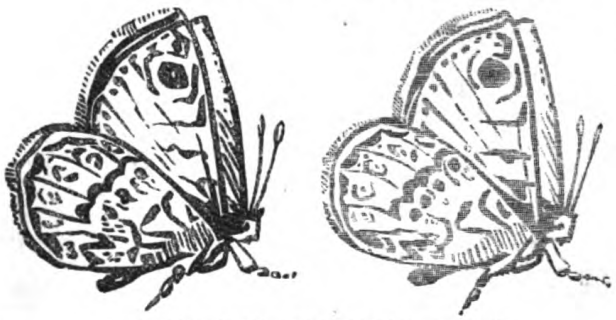
ject than the good old lady was who, when a telegram was brought to her purporting to come from her son, and asking her to send him some money, said they could not swindle her in that way, for she knew her son's handwriting perfectly well, and she was sure that dispatch never came from him; or than the child who, hearing that dispatches of various kinds were sent by telegraph, watched a long time in hopes of seeing some of them darting along the wires. Still, to the mass even of intelligent and well-informed readers, the precise mode in which the communications are made is a mystery more or less inscrutable.

The difficulty of forming a clear conception of the subject is increased by the fact that while we have to deal with novel and strange facts, we have also to use old words in novel and inconsistent senses. Scientific men have, of course, found it necessary, in describing the phenomena of electricity, to use words which mankind have heretofore used to designate other things of somewhat analogous nature, and which call up in the mind conceptions quite inadequate to the new fact. Thus, when it is said that a current of electricity *flows* along the wire, that the wire or the current *carries* a message, the speaker takes language universally understood, relating to a fluid moving from one place to another, and a parcel or letter transported from place to place. He does not, however, mean that there is any stream flowing, or any thing whatever transported, but he is speaking only of the action and reaction of an imponderable force, and the making of intelligible signals by its means at a distance. Such language the world must, perhaps for a long time to come, continue to employ; and it is not strange that those to whom the subject described by it is entirely new should be sometimes laughably misled by it.

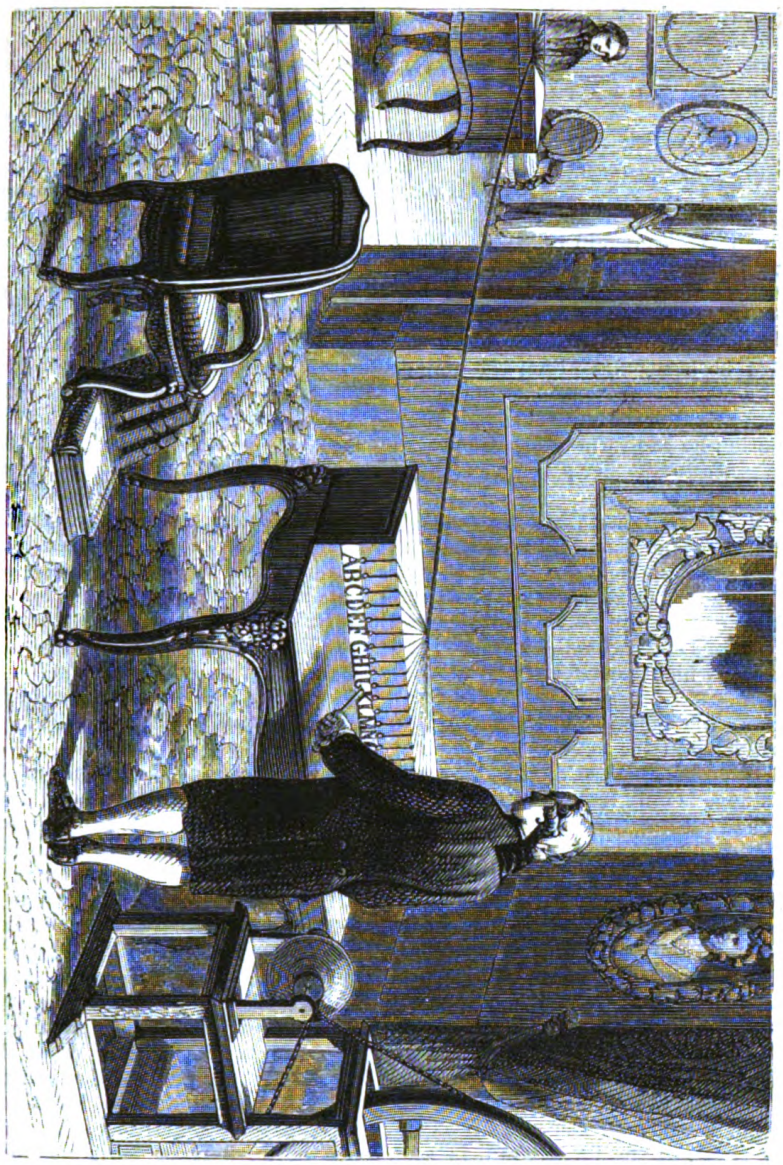


Not long since a countryman came into a telegraph office in Bangor, Maine, with a message, and asked that it be sent immediately. The operator took the message as usual, put his instrument in communication with its destination, ticked off the signals upon the key, and then, according to the rule of the office, hung the message paper on the hook with others that had been previously sent, that at night they might all be filed for preservation. The man lounged around some time, evidently unsatisfied. "At last," says the narrator of the incident, "his patience was exhausted, and he belched out, 'Ain't you going to send that dispatch?' The operator politely informed him that he had sent it. 'No, yer ain't,' replied the indignant man; 'there it is now on the hook.'"

So far as the exact use of language was concerned, the man was right. Still more ludicrous mistakes sometimes occur. Thus the German papers reported that at Carlsruhe, toward the close of the late war, an aged mother came to the telegraph office carrying a dish full of sauerkraut, which she desired to have telegraphed to Rastadt. Her son must receive the kraut by Sunday. The operator could not convince her that the telegraph was not capable of such a performance. "How could so many soldiers have been sent to France by telegraph?" she asked, and finally departed grumbling.

Almost every operator meets with equally amusing instances. One recently related the following incident: "A gentleman came to my office to send a message, and after writing it, waited, as people often do at small offices, to see it sent. I called 'Office,' and the operator at the other end of the line came to the key and said, 'Busy—wait a minute.' So I leaned back in my chair to wait, when the gentleman said, 'Have you sent it?' I said, 'No; they say they are busy—to wait a minute;' whereupon he said, looking surprised, 'Why, I didn't hear them;' and then added, brightening up, as if he had thought of the reason, 'but I'm *a little deaf in one ear!*' I think I managed to keep a straight face till he left, but it was hard work."

It may make this distinction more clear if we advert to the transmission or production of designs, drawings, etc., by telegraph.



There is an instrument, which we shall hereafter briefly describe, by which this can be done. We should not, however, say, in the case, for instance, of the butterfly in the illustration, that a butterfly was sent by telegraph, nor even that a picture was sent. The operator, being furnished with one picture, created another like it, hundreds of miles away, by means of the telegraph.

A PICTURE PRODUCED BY CASELLI'S INSTRUMENT.

The first step in endeavoring to understand the operation of the telegraph is to learn to make allowance for the new sense in which many terms are employed, and to form a new conception for each, more appropriate to the new fact. Thus, though we

LESAGE'S TELEGRAPH.

continue to speak of the current, it must always be understood as not designating a flowing fluid, and we are not to conceive of the electricity as carrying the message that we write, but rather as enabling the operator at the other end of the line to write a similar one.

Nearly two hundred and fifty years ago, when men were still dreaming of alchemy and the philosopher's stone, they conceived of two sympathetic needles which, instead of always pointing toward the north pole, should be so powerful in relation to each other that in whichever direction one was turned, the other would imitate its motion.

Strada, an ingenious and learned Jesuit of Rome, is quoted as having said, in describing this project, "If you wish your distant friend, to whom no letter can come, to learn something, take a disk, or dial, and write round the edge of it the letters of the alphabet in the order in which children learn them, and in the centre place horizontally a rod, which has touched a magnet, so that it may move and indicate whatever letter you wish. Then, a similar dial being in the possession of your friend, if you desire privately to speak to the friend whom some share of the earth holds far from you, lay your hand on the globe, and turn the movable iron as you see disposed along the margin of all the letters which are required for the words. Hither and thither turn the style and touch the letters, now this one, and now that.....Wonderful to relate, the far-distant friend sees the voluble iron tremble without the touch of any person, and run now hither, now thither: conscious, he bends over it, and marks the

teaching of the rod. When he sees the rod stand still, he, in his turn, if he thinks there is any thing to be answered, in like manner, by touching the various letters, writes it back to his friend."

This conceit, which Addison, in No. 241 of the *Spectator*, delicately ridicules as a chimerical notion, has proved to be a very graphic description of Wheatstone's needle telegraph, so well known in England. If we add that the needles are kept in this sympathy with each other by a wire stretched from the stand of one to the other, so that whatever electrical disturbances affect the wire affect both needles alike, the reader will have a more accurate conception of the elementary principle of the telegraph than by any notion he can form of a current sent from one place to another along a conducting wire.

About a hundred and fifty years after Strada wrote—namely, in 1774—a successful attempt was made by Lesage, a philosopher of Geneva, to establish a real and physical connection between two distant places by means of frictional electricity, the only form in which electricity was at that time known.

The engraving shows the construction of his apparatus, and the manner in which it operated, though, of course, on a small scale, as the distance is only from one room to another. The rope which forms the medium of communication between the two stations is formed of wire. It consists of twenty-four strands, one for each letter of the alphabet. These strands are insulated from each other in the rope, by being each covered with some non-conducting substance, and the ends are separated at each station, and made to diverge over a table of glass or other non-conductor; and finally, the extremity of each strand terminates at each station in a pith-ball electrometer, which hangs over the letter that that strand represents.

On the right, in the foreground, is seen an electric machine for producing frictional electricity.

The arrangement of the separated ends of the wires at the farther station, and their connection with the pith balls and the letters, are the same as at the station in the foreground.

The operator at the hither end of the line has now only to make a connection by means of a discharging rod between the conductor of the electric machine and any one of the wires. The wire, being insulated, becomes electrified through its whole length, and indicates its condition by means of the pith ball at the farther end, and so points out to the observer there the letter that is intended. In this way, of course, by designating different letters in succession, any desired communication could be made.

This method was founded on correct principles, and for certain very short distances it was practically successful. It could, however, never be any thing more than a philosophical toy, on account of the difficulty of transmitting the electrical influence, *in that form*, to any considerable distance. Those characteristics of frictional electricity which are ascribed to what is termed a condition of *great intensity*—whatever that may mean—make it very difficult to insulate a conductor of any great length or extent of surface, employed to contain or transmit it. Lesage's apparatus could not be made to operate except for very short distances—too short altogether to make it of any practical use. It was not until after the discovery of a form of electricity of extremely *low* intensity—so low as to allow of the easy insulation of thousands of miles of wire—and the discovery of the relations of electricity and magnetism, by which two magnets thousands of miles apart can be put into communication with each other, and made to act synchronously, that the invention of the electric telegraph, as now constructed, became possible. The invention of Lesage, however, taken in connection with the fantastic idea of Strada, may be considered as in some sense the embryo and prototype of the modern marvel.

The histories of the inventors of the telegraph are more or less familiar to many readers, and without pausing to recount them here, let us pass to some account of the features of the system now in use.

If one should cut the wire as it hangs between two telegraph poles, and take one end in each hand, he would feel a slight succession of shocks, as the impulses of electric force by means of which the signals are made would course through his arms from one hand to the other. What this subtle force *is*, no one knows. Some of its properties are now understood, but the thing itself eludes our cognizance. The only difference between those least acquainted with the subject and the professional electricians who devote their lives to the study of it is that with the latter the mystery, without being less, lies deeper. In respect to the operations of electricity, as is true, in fact, in respect to all the operations of nature, though scientific men may succeed in tracing the steps of the process a little way, they are sure to come to the region of inscrutable mystery at last. As one has well said, the further the radius of investigation is extended, the greater appears the circumference of the unknown beyond.

There are certain general principles, however, on which the phenomena of the electric telegraph depend, which are also exemplified in a great many of the most important processes going on around us in nature and in art, which it affords great pleasure to all who love knowledge for its own sake

to understand, though it must be confessed that the understanding of them is not of any practical importance in enabling us to transact our business at a telegraph office.

One of the most important and most fundamental of these principles is this, namely, that whatever force is expended in separating from each other two substances that are found naturally united, is given out again when the substances once more come together. Thus, if a weight is raised for a certain distance above the earth, a certain force being expended in the raising of it, precisely that amount of force, neither more nor less, will be exerted by the fall of the weight back to its original position.

And in the same manner, whatever force has been expended in separating the particles of two substances which are united by a strong chemical affinity is precisely restored when they are allowed to come together again. The most common case of such separation and reunion consists in the abstraction of oxygen—which is the great substance in nature that has the strongest affinity for almost all other substances—and the return of the oxygen to its original combinations again. In this return it gives out, of course, the force which was expended in the separating of it. This force usually reappears in the form of *heat*, and in cases in which the action is very intense—that is, in which the force is made to reappear in a very rapid manner—heat and light combined, thus producing the phenomenon which we call combustion.

Under some conditions, however, the restored force appears in the form of *electricity*. Of the inner and intrinsic nature of this form of energy we know very little. Still a great deal, comparatively, is known of the effects which it is capable of producing, and the cause producing them was formerly supposed to be a distinct and specific substance. When, however, it was at length found that the development of the electric action was always accompanied by the expenditure of some form of force, and that the force in which it thus originated disappeared just in proportion as the electric agency was developed, and, moreover, as the electric agency could be made to produce again the forms of force in which it originated, disappearing itself as the others reappeared, the conclusion was apparently inevitable that the effects are produced not by the *transfer of a substance*, but by the agency of some one of the numerous forms which the mysterious principle of force is continually assuming.

That which passes along the wires, therefore, is simply *an impulse of force*.

This force must not, however, be conceived of as a single force: it exists in two forms or phases, having a very remarkable relation to each other. Many years ago, when electricity was generally supposed to be a separate substance, permeating all ordinary objects, there were supposed to be two kinds, which were described as two fluids. Any object electrically excited was said to be charged with an excess of the one fluid or the other, sometimes the "vitreous fluid," sometimes the "resinous fluid." And a discharge or current of electricity was understood to be the disturbance caused by these two fluids in coming together again and neutralizing each other. The ordinary condition of objects not electrically excited was explained by regarding them as charged with both fluids in equal degree. Franklin sought to explain the same phenomena by the simple theory that there was only one fluid, that vitreous electricity was an excess of this one fluid over the natural amount, and that a deficiency was resinous electricity. He accordingly called the one "positive" and the other "negative;" and he described a current or discharge as the act of the excess contained in an overcharged object passing to an object which was undercharged, thus restoring the natural or ordinary equilibrium in both.

The invention of the galvanic battery was developed during periods when these theories were in vogue, and the terms "current," "positive electricity," and "negative electricity" were accordingly adopted in the language used to describe the action of the battery, and still continue in use to some extent, and although literally inappropriate, we shall have constant need to employ them in the following pages.

In a recent article in the *Journal of the Telegraph*, Mr. Prescott, the electrician, describing the propagation of electricity, compares it to heat, in the following language: "Toward the end of the year 1859, M. Gaugain, an able electrician, who had for some time occupied himself in verifying the laws of Ohm in regard to the transmission of electricity over bad conductors, sought to solve the causes of this disaccord [alluding to disaccord of scientists who had not accepted Ohm's laws], and at last found the key to the enigma. He became convinced that electricity, instead of being propagated as a wave, or in a manner analogous to that of sound or light, was, on the contrary, transmitted, as stated by Ohm, in the manner of heat in a metallic bar, which is hot at one end and cold at the other. In this case the heat and the cold communicate from place to place gradually from the two extremities of the bar, and in proportion as this double movement of heat and cold is propagated toward the middle of the bar the parts first heated and cooled acquire and lose a quantity of heat, until, the two calorific movements having met each other, the different points of the bar lose on one side as much heat as they gain on the other. Then the calorific equi-

librium is established, and the distribution of heat upon all parts of the bar remains the same. This is what is called the permanent calorific state. But before a metallic bar arrives at this state it requires more or less time, according to its calorific conductivity, and this time, during which every point of the heated body unceasingly changes in temperature, constitutes a variable period, which, if the assimilation of the propagation of heat with that of electricity is true, ought to exist in the first moments of the transmission of a current; for, in this hypothesis, an electric current is only the result of the equilibrium which tends to establish itself from one extremity of the circuit to the other, between two different electric states constituted by the action of the battery, and representing, consequently, the two different temperatures of the heated bar."

This comparison will afford better elements for forming a conception of the electric force than the notion of fluids and currents.

The battery is the source of power for the telegraph, and in this respect it may be compared to the boiler in the steam-engine.

It is now believed that all chemical action, however slight, gives rise to a development of electricity; and a battery is an arrangement of metals and acids combined in such a form as to cause a powerful chemical action. The electric result is greatest when two metals are used one of which is strongly and the other slightly acted on. If two such pieces of metal are connected by a conducting wire, positive electricity moves or acts from the former metal through the acid to the latter metal, leaving the negative force in preponderance in the former metal. The positive electricity does not, however, remain quiescent in the second metal; it passes out by the conducting wire, and returns to the place of its origin in the first metal, where it is neutralized as fast as it arrives by the negative electricity there accumulated.

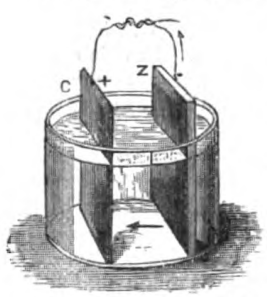

FIG. 1.—THE VOLTAIC PAIR.

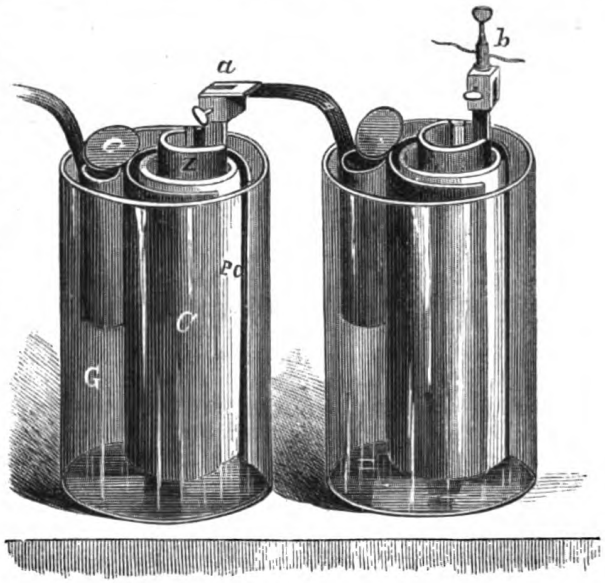

FIG. 2.—THE DANIELL BATTERY.

G is the glass or earthen jar, which is nearly filled with a saturated solution of the crystals of blue vitriol (sulphate of copper). If a bit of white paper is dipped beneath the surface of the liquid, the color of the liquid is very apparent, for it makes the paper look blue. C is a plate of copper, bent into a cylindrical form so as to fit loosely within the outer vessel. It has a pocket or chamber of copper, fastened to the upper part, with a perforated bottom, into which fresh crystals of vitriol are thrown from time to time to renew the strength of the solution. These crystals might as well be thrown to the bottom of the jar, were it not that by being dissolved near the surface they keep the solution of nearly equal strength throughout, instead of making it much the strongest at the bottom. P C is the porous cup, about two inches in diameter, which stands within the copper cylinder. It is nearly filled with soft water, or salt-water, or sometimes with a solution of sulphate of zinc. Z is the plate or block of zinc. This is made in various forms—a hollow cylinder being more powerful, on account of its greater surface, but more difficult to clean, than a plain strip. A binding screw (*b*) at the top of the zinc plate receives the negative pole wire. A strip of copper fastened to the copper cylinder, and provided with a binding screw (*a*), receives the positive pole wire, or serves to make connection between the copper of one "element" (as each jar or each pair of metals is called) and the zinc of another, when it is desired to unite several jars, or elements, to gain additional force.

This arrangement is shown in Fig. 1.

Here, in a glass vessel, are inserted, on the right hand a plate of zinc, and on the left a plate of copper (lettered respectively Z and C). The conducting wires, or pole wires, are brought around, and touch each other above. If, now, the vessel is filled with diluted sulphuric acid, the liquid begins to corrode the zinc—it burns it, so to speak—and gradually dissolves away the surface. This chemical action consists largely of the oxygen of the water leaving the particles of hydrogen with which it was united, and combining with the zinc. The force that is evolved in this change, as above explained, is in the form of positive and negative electricity. These, separating from each other, pass out of the battery, one going through the fluid to the copper and thence to its wire, and the other in the opposite direction, and they meet and seek to recover their union and equilibrium in those parts of the circuit where no chemical change is taking place.

Meanwhile the process of evolving more positive electricity upon the copper and more negative upon the zinc goes on, so that a continuous current is said to flow from the battery. The point of contact where the positive electricity leaves the battery for the conductor is termed the positive pole, the other the negative. The course of the currents is indicated in the figure by arrows.

The force generated by a battery of so simple construction as this soon becomes weak from the decomposition of the liquid and other causes. To remedy this defect several batteries have been devised which are constant in their force. These are usually designated by the names of their inventors. Daniell's and Grove's are the two forms perhaps most generally used in this country.

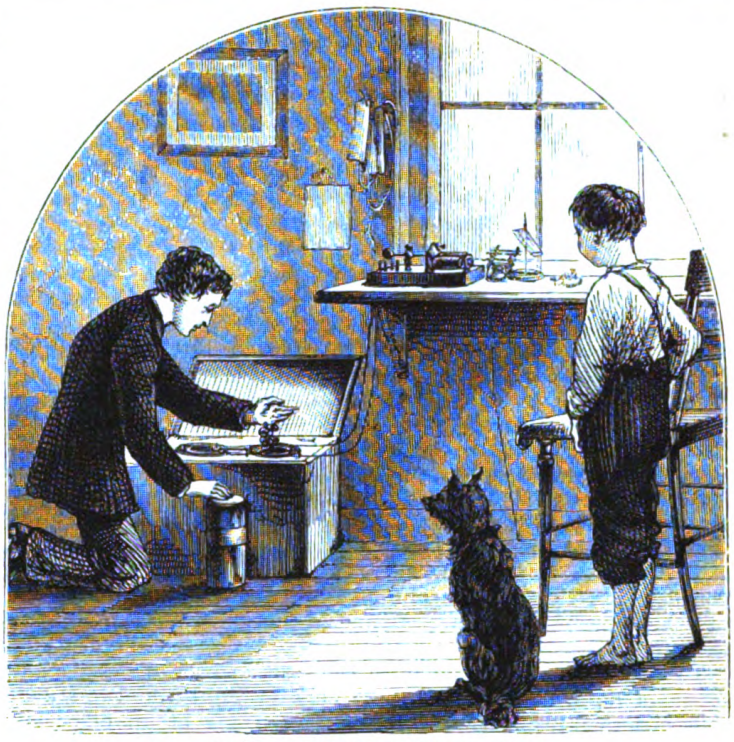

FIG. 3.—REPLENISHING THE BATTERY.

The Daniell battery is the one commonly used in small offices for the local purposes which will afterward be explained.

In Grove's battery, which has long been in use at the great central offices for the principal supply of the main lines, the outer vessel is filled with diluted sulphuric acid, and in this the zinc plate is immersed. The porous vessel placed within the zinc plate is then filled with strong nitric acid, and in this a plate of platinum is immersed. The platinum here takes the place of the copper used in the other form of battery.

The object of the porous cup in both these batteries is simply to separate the two liquids without intercepting either the chemical action between their constituent elements or the electric current. A very beau-

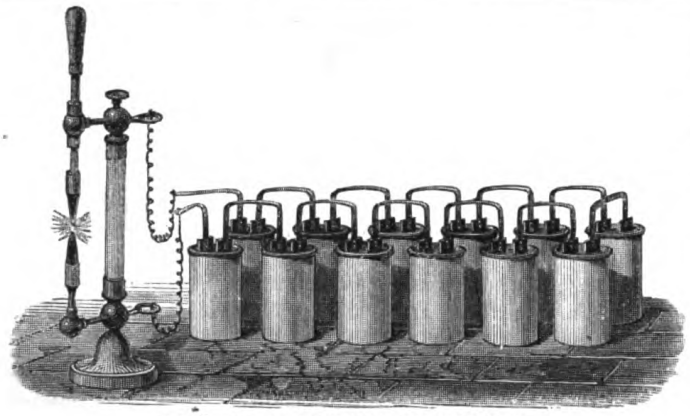

FIG. 6.—A BATTERY OF TWELVE ELEMENTS.

tiful improvement is presented in the Calland battery, in which the chemical solutions are placed in a single jar. One solution being saturated, and heavier than the other, sinks to the bottom, where the copper plate lies. The lighter solution, diluted, fills the upper part of the glass, and in this the zinc is suspended.

To gain the intensity of force necessary for main lines, a number of these cups or cells with their respective pairs of metals are united by connecting one pole of each to a pole of its next neighbor. Each cell or pair is termed an "element." For instance, a battery of fifty elements means one composed of so many jars thus united.*

Many persons have noticed that a humming sound—a low musical note—sometimes proceeds from the telegraph wires as they hang stretched upon the poles, which is caused by the wind playing upon them as upon the strings of an Æolian harp. Even when the wind is light, the sound can often be heard by applying the ear closely against the pole. Some persons have erroneously attributed this sound to the electric current. That it really proceeds from a vibration of the wires, strung as they are, may be proved, when there is no wind, by punching the pole with the end of a cane or umbrella so as to jar it slightly, and the same sound may then be heard given forth by the trembling wires.

A very strong wind sometimes, by tightening the wire, stops its vibration. The power of the wires to carry their own resonant sound to a distance enables an operator at an office sometimes to hear men working upon the wire miles distant. It is related that at the time of the completion of the telegraphic line to the Catskill Mountain House strong winds prevailed for a few days, causing a peculiarly loud humming noise of the wires. At length the wind died away, and the telegraphic Æolian harp was mute. Several days thereafter the proprietor of the Mountain House, on his way to Catskill, reined up in front of the Half-way House to water his horses, when he was accosted by the Kiskatom landlord: "How's things on the mountain?" "Lively," was the response. "Ain't doin' much telegraphin', are you?" "Oh yes; the line is quite well patronized." "Well, I didn't think so; *I ain't heerd a dispatch go up in three or four days.*"

In truth, the mysterious form of force which we call a current of electricity passes along the wires of the telegraph both silent and unseen. The clicking that is heard in the operation of the telegraph instruments is not the voice of electricity. Just as the force of gravitation pulls in perfect silence upon the weights and pendulum of a clock, and it is only by the resistance which the escapement incessantly interposes to the revolution of the toothed wheels that the tick of the clock is produced, so the electric current, though it sets in motion the tapping armature, is itself silent.

This noiseless and invisible force acts with inconceivable rapidity. The celerity of its passage varies somewhat with the appropriateness of the conductor which forms its path; but the movement is so

* Those who wish to pursue this subject will note a distinction here, which only professed electricians fully understand, and, indeed, on which the best authorities seem not to be fully agreed—the distinction between intensity or degree of tension of electricity, and the quantity of electricity. The nature of the distinction may be illustrated thus: If there were a ball of iron as large as this earth, and a common cannon-ball, both heated red-hot, the *degree* of heat in both would be the same, but the *quantity* of heat in the great globe would be vastly larger than that in the cannon-ball. The thermometer measures intensity or degrees of heat, though it does not measure the quantity or amount. There is a somewhat similar distinction in respect to electricity. The earth is charged with electricity to a certain degree or tension. If a cannon-ball lies on the ground in contact with the earth, it will be charged with electricity in the same intensity. But the quantity contained in the earth is vastly greater than that in the cannon-ball.

Increasing the size of a cell or pair, or—what produces the same effect—connecting all the zincs of several elements together, and all the coppers together, increases the quantity of electricity evolved without increasing its tension. Increasing the tension is accomplished by connecting the zinc of each element with the copper of its next neighbor.

Frictional electricity, or the free electricity of the thunder-storm, is found to be the same as magnetic electricity, except that it is of a very high degree of tension, and can not be produced in sufficient quantities, nor can the lines be sufficiently insulated, to make it available for telegraphs, as Lesage attempted to do. Its tension being very high, the degree of resistance which effectually insulates galvanic electricity is not a barrier for it, and it escapes from the wires.

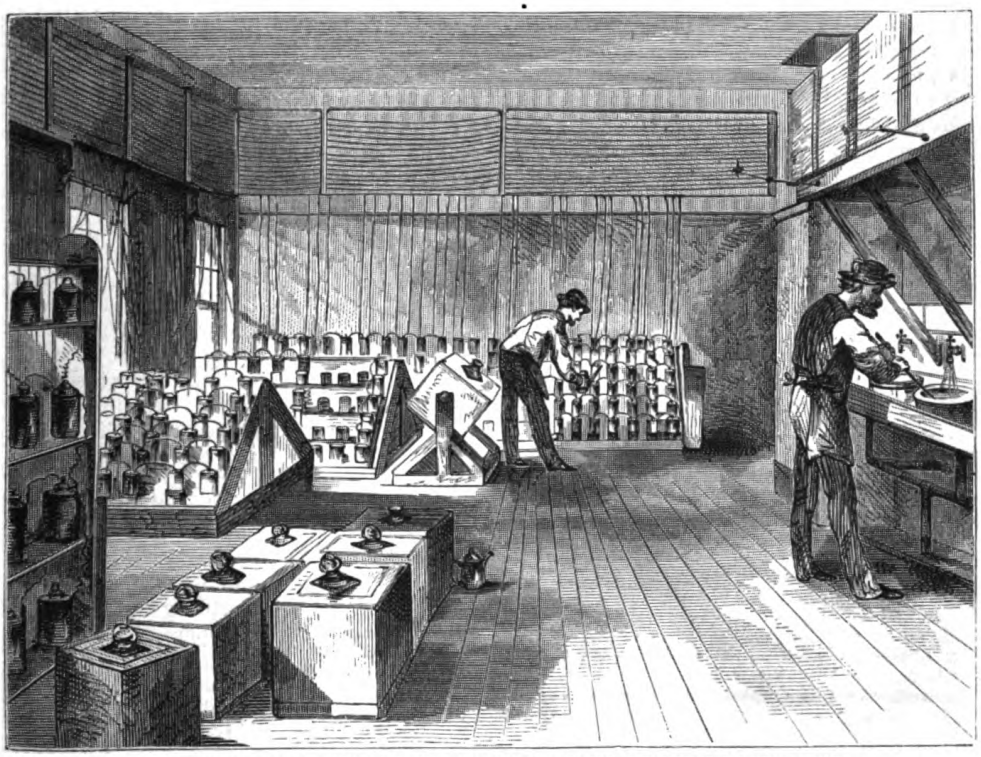
nearly instantaneous that practically the only delay, even on the longest lines, is in the intervals of time occupied by the operator at one end in setting the successive pulses of the current in motion, and by the operator at the other in observing almost at the same instant their passage.

The force which passes from a battery over the wires, though it moves with such marvelous rapidity, and though, so far as we can picture it to our imagination, it consists simply of some vibratory or quivering motion among the particles of the wire, is really much greater in amount than one would be inclined to suppose. The particles of oxygen and hydrogen, for example, as united in water, are held together by an immensely powerful attraction, and a very great force is necessary to separate them. This force, or *energy*, as it is technically called, is all given back when the separating particles come together again in the process of combustion, by which the water is re-formed. It is the same with the particles of oxygen and those of zinc. A great force, though it is a force acting through very minute distances, is expended in separating the oxygen from the zinc in the ore, to form the metallic zinc used in the batteries. All this force is given back when the oxygen is restored, and under the conditions in which the restoration takes place in these batteries the restored force reappears in the form of electricity. It is said that the annual cost of the maintenance of the batteries used by the Western Union Telegraph Company—that is, for the supplying the force which is expended in the electrical pulsations which pass over their wires—is over $125,000.



When this current and the means of producing it became known to the world, many minds busied themselves with the thought of sending messages to a distance by means of extending the wire circuit, and a great variety of devices were tried for this purpose.

One inventor arranged a key-board with ten keys, one for each finger, and with ten wires, one communicating with each key. The operator who was to receive the message sat with fingers and thumbs upon the keys, and received a little shock in one after another of his digits, each of which he interpreted to mean a certain letter, according to a prearranged table.

Another proposed to resort to the light and heat which are developed when the electric current is made to pass from point to point of two pencils of charcoal, in connection with the opposite poles of the battery.

To form an intelligent idea of the principle of the telegraphs now in use it is necessary to advert to a very peculiar property of electricity, which constitutes, in fact, one of the most curious and singular facts in nature.

If a current of electricity is passed along a wire near to a compass or magnetic nee-

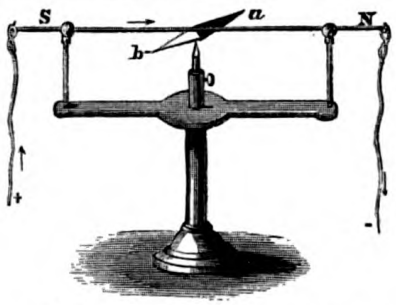

FIG. 7.—THE DEFLECTION OF THE NEEDLE.

dle, without however touching it, it will cause the needle to turn and take a position at right angles to the wire, or to tend toward such a position in a degree proportioned to the strength of the current. If the current is passed in a similar manner across a bar of soft iron, without touching it, it causes the iron to be a magnet; that is to say, the proximity of the current will make iron that is not a magnet become one, and will make iron that is a magnet turn at right angles to the current. When the current ceases the needle returns to its ordinary position, the bar ceases to be a magnet. Singularly enough, if the wire is suspended so as freely to turn, and a magnet is laid beneath it, the wire will turn so as to cross the direction of the magnet.

This power of the current to make a temporary magnet of every piece of soft iron within its influence, and to turn magnetic needles at right angles to itself, is the property resorted to, under one form or the other, in nearly all the telegraphs now in use. It is a mysterious sympathy, which has afforded to scientific observers a great many curious and beautiful experiments.

If a double current is carried past the needle or bar of iron, double the effect is produced. To enhance the power of the current, therefore, a coil of wire passing around the bar or needle is commonly employed. Thus Fig. 9 represents a rod of soft iron inserted within a spiral coil of a conducting wire. The effect of the coil is to make the path of the wire lie across the rod for a long distance, and the magnetism of the bar is very perceptible. If the spiral is right-handed—that is, if it runs like the thread of an ordinary screw—the north pole of the bar will be at the end at which the positive current emerges, the south pole at the end at which it enters. Whenever the current ceases the bar loses its magnetism. If both spirals were wound on the same bar, and equal currents sent through them, the influence of one upon the bar would be counteracted by that of the other, and it would not become a magnet.

The attractive power of both poles can be used at once, if the rod and coil be bent into the form of a horse-shoe, and can be shown by its lifting iron pins from a tray, or holding even a heavy weight.

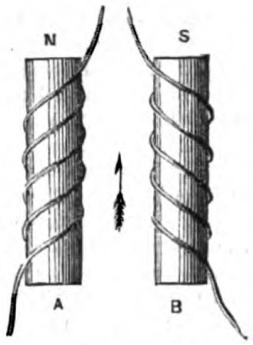

FIG. 9.—THE SPIRALS.

A, a right-handed spiral; B, a left-handed spiral; N, north pole; S, south pole.

But if in the construction of such a magnet the wire is wound in the wrong direction on half the bar, the two parts neutralize each other. Which end of the iron shall become the north pole depends on whether the wire is wound from right to left or from left to right. If even the same wire is wound both ways, the one influence counteracts the other. It must be made as if wound on a straight shaft, and afterward bent. The effect is not produced if the bare wire is wound on the bar, returning on itself, like thread on a spool; the wire is therefore always covered with silk or some other insulator, so that each turn is separated from the others, and the current is compelled to follow the entire length of the wire.

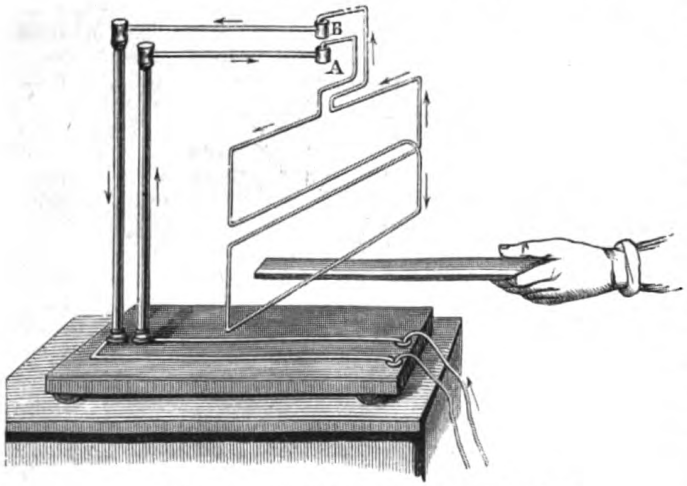

FIG. 8.—DIRECT ACTION OF A MAGNET ON A CURRENT.

These two spools, covered and painted black, and in form rudely resembling the barrels of an opera-glass, may be recognized in the instruments in any telegraph office.

If the line is not too long, and the battery is

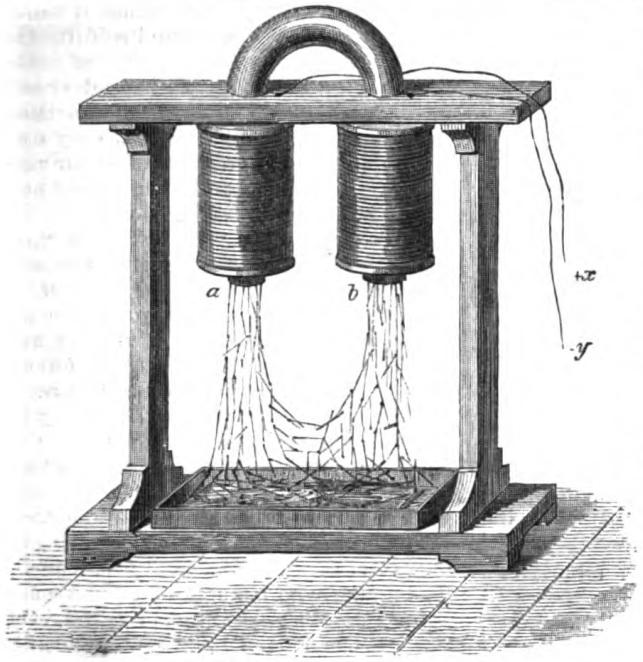

FIG. 10.—THE ELECTRO-MAGNET.

sufficiently powerful, the magnet may be made to attract an armature, or bar of iron suspended near it, and the armature in moving may sound a bell. Fig. 12 represents an alarm-bell of this kind, which has been much used in Europe. The wire may be traced entering the apparatus at A. Being fastened there with a thumb-screw, it is in contact with the wire coiled around the magnet at B. The other end of the wire coil is connected with a metallic rod in the bottom of the case, to which the spring that supports the armature is affixed. The other wire of the line enters from the other side, and is fastened to a thumb-screw from which rises a slender tongue of metal against the armature. When the current is established through wire, coil, armature, spring, and wire again, the magnet attracts the armature, and the hammer, G, strikes the bell, H. But the armature, by the act of leaving the spring, F, breaks the circuit, for the current can no longer pass from the armature to the line wire. The horseshoe bar therefore ceases to act as a magnet, and the armature falls back to its place. The instant it touches the spring, F, the current is again established, the magnet acts, the bell strikes, and so again, thus ringing like an alarm-clock. As seen in Fig. 15, the armature, instead of ringing a bell, may be made to move a pencil or a pointed stylus, and make a mark upon a moving strip of paper.

In the dial telegraph the armature moves a lever which drives a rachet-wheel, and this carries an index, or pointer, by which words are spelled out on the dial. If we imagine the circumference of the wheel to bear type, so that each letter could in turn be printed, we have a clew to the principle of the little stock telegraph instrument which may be seen at work any day printing off quotations in any broker's office or great hotel in New York.

It has been said above that the current does not actively manifest itself unless the two poles of the battery are connected by a conductor. When this connection is broken, the current ceases to flow, not only at the point where the break is made, but in every other part of the wire at almost the same instant.

Those who have attended an experimental lecture upon electricity may have witnessed, or perhaps participated in, the formation of a ring by those members of the audience who were willing to try a shock. The person at one extreme takes hold of the chain connected with the con-

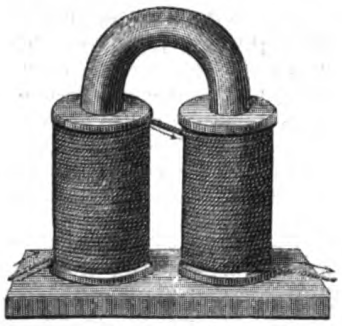

FIG. 11.—THE BOBBINS.

ductor, but no sensation is felt until the one at the other extreme touches the opposite pole of the machine. So far as manifestations in the sensation of the circle show, the

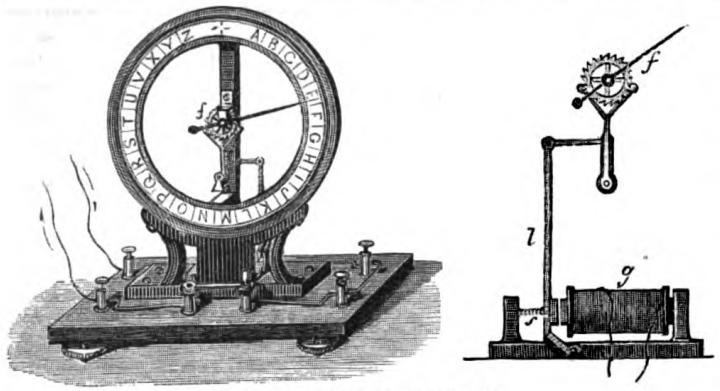

FIG. 13.—THE DIAL TELEGRAPH.

g, The bobbins; *s*, spring to draw back armature; *l*, lever; *f*, index.

electricity seems not to start at all until it can go entirely around. The instant the connection is formed the electricity, so to speak, discovers that the course is clear, and flashes through the whole circuit of outstretched arms and hands.

Electricity, like light, heat, and sound, requires time for its passage through space; yet so rapid is its motion that it was formerly supposed that it could not be timed, but recent experiments have succeeded in doing so. The wires between Cambridge, Massachusetts, and San Francisco were connected several years ago, making a circuit of over 7000 miles, with thirteen repeaters. The time required for the flow of the current was seventy-four-hundredths of a second, or, deducting the time required to open and close the repeaters, about three-tenths of a second, or at the rate of 1,400,000 miles a minute. The rapidity of the motion is shown by the following illustrations:

If a magnetic spark is flashed through gunpowder, it may scatter the kernels of powder without igniting them. If a silvered wheel is made to revolve many thousand times a minute, the spark will show it at rest. If a man be struck by lightning, death appears to follow before sensation has time to reach the brain through the nerves.

The signals, whether by means of the needle or the electro-magnet, are made by a succession of shocks or pulses; and to produce these it is necessary to break the circuit and to close it again many times in succession. Cutting the wires of a telegraph, which we used to hear of when there were fewer lines than now, stops communication. When the ends of the wire are fastened together again, communication is re-established. If no instrument for making the signals is at hand, as is sometimes the case, the signals can be made by taking an end of the wire in each hand, and touching them together again and again. Insulation may be preserved by wearing silk gloves, or using a silk handkerchief.

The genius of Morse showed itself in the simplicity of the means he devised; and it is to their simplicity that they owe their pre-eminence and their almost universal adoption.

The Morse key, or transmitter, which is the name given to the instrument he devised for making and breaking the circuit with speed and accuracy, is simplicity itself; but upon this little lever, capable of but a single motion, may be expressed every word the pen can write or the tongue speak. It will be most readily understood, perhaps, by a drawing of a rude form in which it was at first made.

The reader who has followed these somewhat dry details respecting the battery, the instantaneous current, the electro-magnet signals, and the mode of making the circuit and breaking it again, is prepared to understand the "circuit," and to trace the operation of the telegraph upon it.

It has already been said that a complete circuit must be formed in order to induce the current to move. The earlier telegraph lines were formed by a wire running from one terminus to the other, and then returning to the battery at the starting-point, thus making a complete metallic circuit. It was discovered, however, by some investigators, who were endeavoring to make the track of a railway serve instead of a wire, that the earth itself would act as a conductor for the return current, or, as perhaps it may be more properly conceived, that the earth being a vast reservoir of electricity, the current from the battery will willingly leave the battery by the positive pole, and traverse the conducting wire to a great distance, if it be allowed at last to enter the earth, and if, at the same time, the battery, by having its negative pole also connected

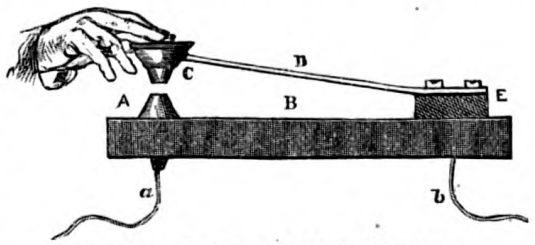

FIG. 14.—THE PRINCIPLE OF THE MORSE KEY.

The wire, *a*, is carried through the table, B, and connects with the little nipple or anvil, A. The table being a non-conductor, the current can not pass through it. When the button, C, at the end of the spring or lever, D, is pressed down so as to touch the anvil, the current instantly passes through, and from the metallic block, E, passes to the wire, *b*.

with the earth, be allowed to draw an equal amount from that natural reservoir, and thus in effect maintain the circuit. Since this discovery a single wire serves for a complete line, provided adequate connection with the moist soil of the earth be maintained at each extremity. In cities and towns where there are gas and water pipes, it is sufficient to carry the extremity of the wire to these pipes. In some offices it is twisted around the gas bracket in the wall of the room. In places where there are no such pipes a sheet of metal is fastened to the end of the wire, and buried in some damp cellar.

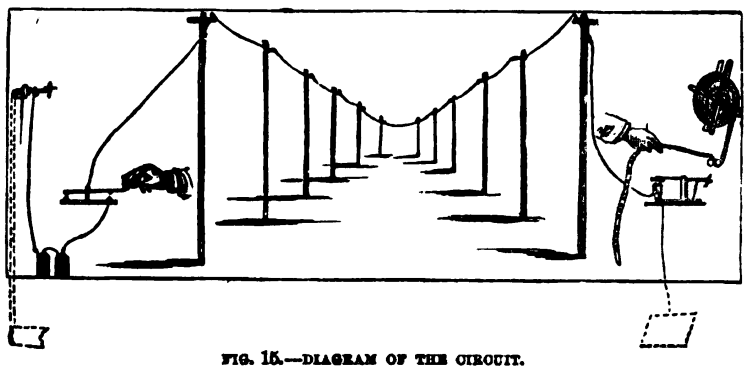

FIG. 15.—DIAGRAM OF THE CIRCUIT.

This is called making a "ground."

In Fig. 15 we have a diagram illustrating a circuit. In the office or terminus on the left are two jars upon the floor, which may represent the battery. From the positive pole the wire is carried beneath the table, there to connect with the anvil of the key. From the axis of the key the main wire or line wire runs, suspended in the air by being tied to glass insulators upon the poles. At the other terminus is an electro-magnet, placed upright, with an armature over it. The armature is fastened to one arm of a lever. The other arm is provided with a pencil or style, above which is a slip or ribbon of paper. The paper may be pulled by hand, as in the diagram, but for greater steadiness and convenience clock-work is employed. The armature hangs above the magnet, and is kept up by a delicate spring. To make a circuit, so as to enable the current to return to the battery, as the saying is, the wire is connected at each end with the earth.

This arrangement constitutes a circuit; but the current will not act in it while it is broken at the key, as represented in the diagram. The electricity is not powerful enough to leap from the anvil to the hammer under the lever of the key. In this position of the key the circuit is said to be open. The instant the hand of the operator presses down the key the circuit is closed, the whole line is excited by the electric force, the bar becomes an active magnet, and draws down the armature, which clicks, as up goes the pencil or style against the moving paper. If the operator at the key holds the key down a short time, a dash is made on the paper. If he releases it as soon as it is down, a dot is made.

Some one may ask, how is the answer sent back upon the same wire? To do this it is only necessary to have a key inserted in the wire at the right-hand office, and a register, or sounder, as the electro-magnet is called, in the other office.

The railroad traveler who looks out of the car window at some rural station often sees that the window of the telegraph office is the principal object of interest. A little group of loungers are gathered about the window-sill looking in. If he should enter the room, he might see the operator at the key, holding a dispatch in her hand, and with the key making the strokes which are necessary for its transmission. The line wire connecting with the key passes up the window-frame, and through the wall, to the telegraph poles beyond. Next to the key, upon the broad shelf which serves as a table, is the switch, or cut-off, that enables the operator at pleasure to connect or disconnect the wires that are concealed beneath the table. The largest instrument in the centre is the register, and a heavy weight hung from it drives the rollers which draw the slip of paper from the reel above to be marked by the styles. Beyond the register may be seen the sounder, or relay, connected beneath the table with a ground wire running through the floor, and with the two wires of the local battery. Upon the wall near the operator are the hooks on which the written message papers are filed after the messages have been sent.

If we imagine the message to be carried by a current flowing from the battery at one end to the magnet at the other end of the line, it might seem that a battery at the other end also would be essential to enable a reply to be sent back. But, as has been explained, we are to conceive of the current rather as an excitement of force taking place throughout the whole line if at all, ceasing every where if the line is broken at any point whatever. Bearing this in mind, it will be seen that half a dozen magnets might be inserted at as many different places, and the key might be put in any where, and signals made upon it would be responded to by all the magnets at the same time.

In fact, to conceive an actual telegraphic circuit, the reader may suppose that a line of wire thirty or forty miles long runs through half a dozen towns, passing through ten or twelve offices. In every office there is a key and an electro-magnet. A very simple and ingenious attachment to the keys prevents the key of each office from interrupting the circuit for the other offices, except when it is in use for making signals.

In every office means are provided for cutting off the magnets from connection with the line, so that messages may go through unobserved, but in ordinary practice messages sent from one point to another on the same circuit are heard at intermediate points. A visitor was recently in the office at Hallowell, Maine, and while conversing with the operator, who was at leisure, the sounds of the instrument went on in this way as usual. Soon the operator began to laugh. "What are you laughing at?" inquired the visitor, who saw no occasion for laughter in their conversation. "Oh!" replied the operator, "Bath is saying such droll things to Augusta."

Sometimes all the operators on a large circuit assemble at their posts and hold a conference, in which whoever speaks is heard simultaneously in all the offices. The press reports are usually delivered in this way. All the principal offices in the State of New York are thus supplied with the reports by one writing.

From various causes, some of which will be hereafter mentioned, the force of the current diminishes as the line is extended and the number of instruments is increased; and hence a current which would be powerful enough to traverse a short private line on which there were no intermediate stations, and to move the register at the terminus, may not be powerful enough to serve a circuit upon long lines employed in the service of the public. To increase the force of the current sufficiently is expensive, and practically inconvenient. Resort is had to an ingenious device called the repeater. The name "relay," which was used for the device first adopted for this purpose, suggests an illustration which will enable the reader to form an idea of it. The Persian and Assyrian monarchs, and some European kings of the Middle Ages, had a system of posts for couriers, which were stationed usually at a day's journey from each other. At each post were a courier and horses at all hours ready to start. The courier bearing a dispatch rode all day, and at night he reached a post, where fresh horses were saddled ready for the next stage of the journey, but he himself was exhausted. His force was nearly spent, but he could awaken the courier who was stationed there and deliver the dispatches to him, and he, with fresh strength, instantly took up the journey. In the same way the reader may conceive of the electric current arriving at a station or office so nearly exhausted that it can not go farther with power to deliver intelligible signals, but it still has strength to wake up another battery and set in motion a fresh current, which shall, so to speak, receive and carry forward the message which the exhausted current has just strength to utter.

The means by which this is effected vary with the circumstances, in some cases involving complex apparatus, which seems incomprehensible to any one but a professional electrician, but the main principle which lies at the foundation may be seen in this diagram. The current arrives on the line, say from the west (W), nearly exhausted

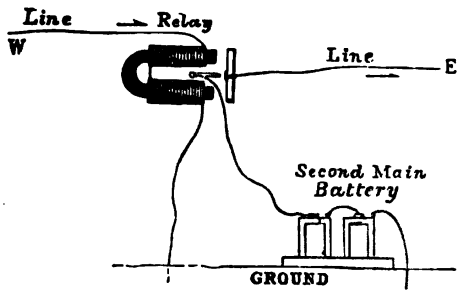

FIG. 16.—PRINCIPLE OF THE REPEATER.

by the resistance or by defects of insulation, etc. It has gone as far as it can carry the power of producing convenient signals. At this point, therefore, the line is cut, and a magnet inserted and connection made with the ground. The magnet is so adjusted that when it draws the armature the latter will touch a metallic point that is fixed between the bobbins. It is then only necessary to connect the further part of the line wire with the armature, and a fresh battery with the metallic point, and whenever the current arriving draws the armature, whether for a dot or a dash, a fresh current of precisely the same length will pass from this battery to the armature, and thence down the line, thus continuing the passage of the message without the intervention of the operator. If there is sufficient power to deflect a magnetic needle in a perceptible degree, this can be made to open and close a circuit by which a fresh powerful current will be set in motion.

It is found that it requires greater force to operate the register by which the message may be recorded on the slip of paper than merely to move the armature and produce a sound which the operator may understand. Hence the same device is used constantly to move the register or sounder.

These, then, are the principal elements of the telegraphic system: an extended insulated wire connected with the earth at both ends, and communicating with a battery which agitates it throughout with electrical

excitement; a key by which the continuity on which this excitement depends can be rapidly broken and renewed at pleasure; and a magnet whose armature, by moving under the influence of the alternations of excitement and quiescence, will instantaneously indicate to the observer every opening or closing of the circuit by the key.

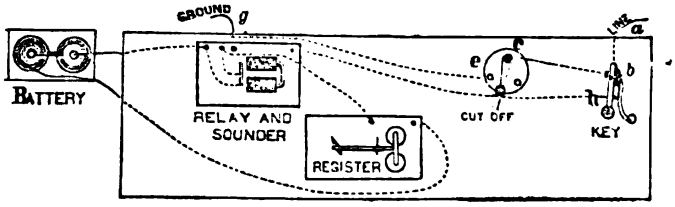

FIG. 17.—DIAGRAM OF THE TABLE OF A TERMINAL STATION.

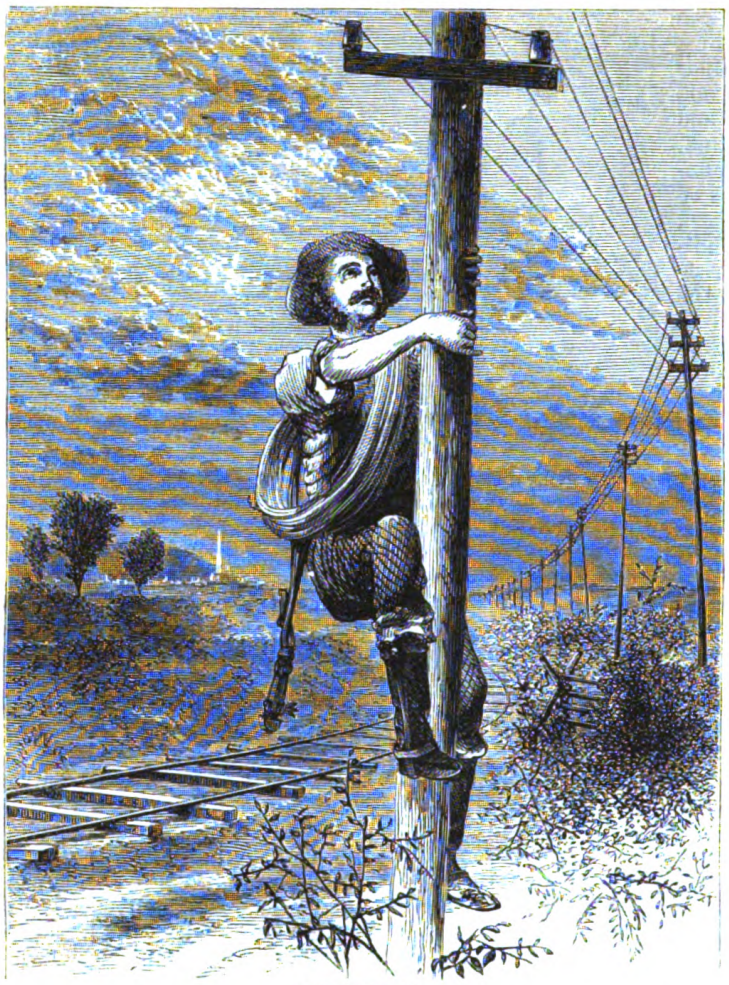
The main line arrives on the right and enters through the wall at *a*, and reaches the key through its screw from beneath the table at *b*. From the same point a wire is carried beneath the table to the cut-off or switch at *c*. By moving the arm of the cut-off, *d*, so as to bring it in contact with the head of the screw on its left, at *e*, connection is made with the continuation of this wire, *g*, to the ground. To make this connection is called putting on a ground. If the current can go this way, it will not undertake to pass through the instruments. In the position of the cut-off indicated in the diagram the connection is broken, and the current is compelled to pass from the key at *h* to and through the relay before it can reach the ground. The motions of the armature of the relay bring the current of the local battery to operate on the register, if desired, so as to record the message.

When we attempt to extend our conception to a congeries of circuits, ramifying in every direction like the fibres of the nervous system in the human body, and constituting a net-work which embraces within its reach every important point in nearly three millions of square miles, we may form some idea of the vastness and complexity of this delicate, sensitive, and all-pervading organization.

The immense net-work of wires which is embroidered over the surface of the United States contains about seven thousand offices (including branch offices in cities), and probably about an equal number of relays.

The first time a visitor enters the operators' room in a great central office the scene is a labyrinth of perplexity and confusion to him. A hundred keys and sounders are clicking all at once, making a noise like a diminutive cotton-mill. The floor is filled with ranges of tables, at which the operators are seated, separated from each other by glass screens. Against one wall is the switch-board, the most conspicuous object in the room. Without any actual resemblance, it recalls to the imagination of many visitors the thought of a great organ, its ranges of slender wires behind the screen suggesting the trackers and pipes, and the innumerable switches representing the keys and stops. Boys are passing to and fro with papers, and messages are sending and receiving from almost every table in the room. But though this may be to the visitor a scene of intricate entanglement, to the mind of the manager, who stands at his side, every instrument and every wire in this maze is clear in itself and in its connections. The expressive description given by a railroad superintendent of his own business is not inappropriate. "When we first take a man on," said he, "every thing is confusion to him, except the one thing he has to do as fireman or brakeman. But when he has served a good time every thing comes out clear to him, and he sees it all different. In fact, *his mind is all made over;* so that, in all the dépôt grounds, with the scores of switches and sidings and signals, and cars and engines moving, his eye sees every thing in its connection, and takes in the whole situation at a glance."



The switch-board, to which allusion has been made, is the central ganglion of the whole system. Every current passes through this apparatus. The manager, standing here, can, by inserting a brass wedge in the course of any current, hear what message is passing. He has thus the means of inspecting and listening to all that is going on over all the wires connected with the office.

To form an adequate conception of the intimacy and delicacy of the apparatus upon which this system depends would require a great degree of technical knowledge. In fact, the recent progress both in scientific investigation and in the art of manipulation has opened almost a new world of facts and principles, which are of engrossing interest to those who have the special training to master them, and which to the rest of us eclipse in marvelousness and mystery the fables of fairy-land and the dreams of magicians. To one to whom measuring the quarter of a second with a stop-watch has seemed to be the height of accuracy, the idea of dividing a second into a million parts, and measuring the duration of electric sparks, and finding that they vary from four-millionths to eighty-six-millionths of a second, appears not merely incredible, but inconceivable. Yet this is done.

Some of the curiosities of the telegraph will, however, be intelligible and interesting. Every substance has a certain specific resistance to the passage of electricity, peculiar to itself, just as some substances are good conductors of light, as glass; others poor, as painted or ground glass; others still are opaque or non-conductors, as wood.

A good conductor of electricity is a substance that presents a low degree of resistance to the passage of the current; a good insulator is one that presents a high degree of resistance. At one time many electricians were engaged in endeavors to devise some arrangement by which lightning might be

THE REPAIRER.

prevented from taking possession of the wires, or safely diverted from them when it had done so. Ingenious inventors had produced a variety of elaborate devices for this purpose, when some practical operator hit upon the expedient of winding the main wire once around the gas-pipe over his table before its connection with the instrument. He interposed a slip of paper between the wire and the pipe to keep them from touching each other. The paper presented a sufficient degree of resistance to prevent the escape of the small current used in telegraphing; but if the lightning took to the wires, the current, being very powerful, overcame the resistance of the paper, passed through, and escaped by the gas-pipes, leaving the instruments unharmed. This practical expedient, which in this country has substantially superseded other inventions, is a curious illustration of the simplicity of the most valuable inventions.

The whole system of the telegraph depends on this principle of resistance, and the different degrees which different bodies present. It is, perhaps, not too much to say that nearly all that can be learned about electricity depends on the definiteness of the laws of resistance and the accuracy of the means of measuring it; and if all substances were alike in respect to their resistance (if this be conceivable), we should probably know nothing about electricity.

Metals present less resistance than other substances, and it is fortunate that it is so. If glass were the only good conductor, the construction of a telegraph line would be a delicate undertaking. Different metals differ in their conductivity. Silver offers the least resistance, copper is almost equal to it, and it is six times better as a conductor than iron. The wonderful difference between substances in this respect will be seen when it is said that iron presents six times the resistance presented by copper, and that pure water presents 6754 million times as much resistance as copper; and yet water presents far less than some other substances. Telegraph wires can not be carried through water without carefully insulating them with an impervious covering, while the dry air of the atmosphere presents such enormous resistance that the wires can be strung along through it without any protection from it.

The resistance of a solid conductor, such as a wire, is in direct proportion to its length, if it be of the same size throughout, and is in inverse proportion to its size. Four wires an eighth of an inch thick are equal in size to one wire a quarter of an inch thick. Hence four miles of the latter will present no more resistance than one mile of the former. Upon the same principle a very small copper wire is as good a conductor as a large iron one. If one examines the instruments in a telegraph office he will see that the copper wire used in the connections of the apparatus is very small in comparison with the iron wire used for the main line.

The electric current, in passing through a circuit, expends or loses a part of its force in overcoming this resistance. The purer the metal, and the more perfect the joints are, the less is the resistance; but it is always something; and the more the line is extended the greater is the aggregate resistance, and hence the more force lost, until, if the line be too long, and without repeaters, not enough reaches the terminus to make intelligible signals.

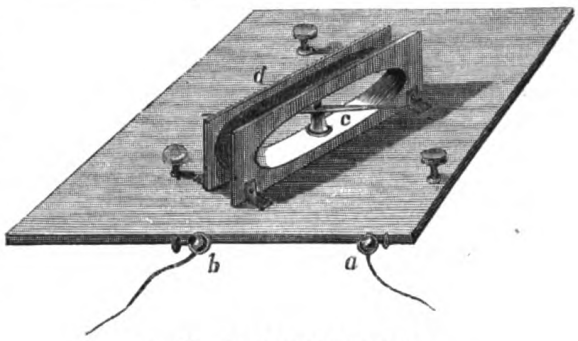

FIG. 19.—GALVANOMETER NEEDLE.

a and *b*, Wires from the battery connecting with the two ends of the coil, *d*; *c*, the needle. The three screws serve to adjust the tablet to a level.

Allusion has already been made to the power of an electric current to deflect a magnetic needle placed near it. This, of course, enables the electrician to detect the existence of a current.

When we ask in what direction the needle will turn, one is amused at the answer. It depends on the direction of the current; and the relation of the two motions is commonly described by a grotesque illustration. If we imagine, say the electricians, that an observer—an imaginary miniature man—is placed in the conducting wire in such a position that the current entering by his feet issues by his head (in other words, that he should swim *with* the current), and then the needle is brought near the wire in front of him—that is, so that his face is toward the needle—it will be found that the north pole of the needle will always turn toward the left hand of the imaginary man.

This singular property of the current affords the electrician the means of ascertaining not only the existence of a current, but also its direction, or its negative or positive quality. And since the degree of the deflection is proportioned to the intensity of the current, the magnetic needle affords a very delicate and sensitive instrument for reading the electric condition of a wire.

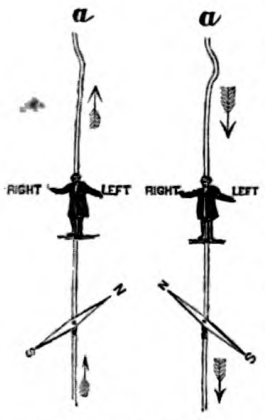

FIG. 18.—DIRECTION OF THE DEFLECTION.

If the wire, instead of being passed in a single strand near the needle, is wound in a coil, and the needle hung within it, the effect is multiplied.

In one form of galvanometer the needle is weighted at one end and hung perpendicularly in the coil. When the current flows around it, it tips to the right or left as the case may be. In diagrams used in books on electricity a ring with a needle hanging perpendicularly within it is used to signify that the diagram represents a circuit with no current in action, while a ring with the needle hanging aslant indicates that the current is in action, and the degree of the inclination of the needle indicates the relative force of the current.

A very curious property of the current must be adverted to here, which is, that if two paths are open to it the current will split or divide into two portions, each taking one of the paths; and if the paths differ in the degree of resistance they offer, the division will be accordingly, and the larger part of the current will take the easier path. This proportion is exact. For instance, if a wire after running a certain distance should be split into two unequal strands, one of which was twice the size of the other, the current would divide in the same proportion precisely, because the resistance of the small strand would be double that of the other. If, however, the smaller strand were cut off to be half the length of the larger, then the division of the current would change, and one-half would take each strand, because by reducing the length of the smaller strand to one-half, its resistance would be reduced to the same amount as that of the larger but longer strand.

This property of the current, together with that to which allusion has been made, of its power to deflect a magnetic needle to a greater or less degree, enables the electrician to ascertain whether a current is flowing in a wire, and if so, in which direction, and also how great its force, and the length of the wire in which it is flowing. To determine the latter, all he has to do is to connect with the wire a coil of a given length, and see how much of the current is diverted by it. Suppose the electrician, for instance, is brought to the wire as it hangs between the poles in the fields between two stations, and is asked if the line is in operation, and which way the message is passing, and how far it is going. It will easily be

FIG. 20.—PARTIAL EARTH.

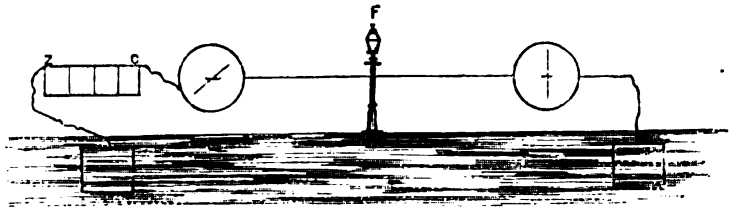

FIG. 21.—DEAD EARTH.

imagined that by cutting the wire and making it pass through the apparatus which contains his magnetic needle and his resistance coils he can tell, by the direction of the deflection of the needle, the course of the current, and by the degree of its deflection the force of it, and by the proportion in which it divides when he invites part of it to pass through his coils—or rather by the length of wire in the coils which he must add in order to divide it equally—how many miles of line wire it has to traverse.

Perhaps a rude illustration will assist some of our readers here. If a house were supplied with water by a long tube and a force-pump at a distance, we shall readily see that the force required to be applied to the pump handle to drive the column of water through the pipe the given distance would be a fixed, definite quantity. Suppose some morning, on applying our hand at the pump, we found that much less force was required, we should infer at once that something had happened to the pipe; probably a break had occurred, by which the water escaped nearer, and therefore more easily. If we had a coil of hose of the same size as the pipe, and which therefore we may suppose would offer the same resistance, and found that the force required to work the pump when connected with the aqueduct was just the same as that required to force water through thirty feet of hose, we might conjecture that the pipe had broken under-ground about thirty feet from the pump, and might begin to dig accordingly.

The measurements made with the apparatus of the electrician are so delicate and exact that an operator, interrupted by a fault in the line, can, without leaving the office, detect within half a mile the place of a leak or defect of insulation a hundred miles away, and at ordinary distances can determine it within a few hundred feet. If a defect occurs any where within the city of New York, for instance, the electrician in the central office can ascertain its location within half a block.

Many curious stories are told by electricians of the incidents that occur in testing for faults. In one case a California miner seeing a broken wire on the line near where he was at work, and knowing nothing of the nature of a conductor, benevolently mended the gap with a piece of blasting fuse of about the same size and color as the wire. Of course this interposed a complete resistance to the current. Repairers were sent out, who reported the line intact at the place indicated; and only a careful examination from pole to pole along the line detected the cause of the difficulty.

In another case an earth current made its appearance on the line between Boston and Salem every night. The electricians dispatched the repairers, who reported that every inch of the line was in good order, and so it proved during the daytime. But at night there was always trouble. Some of the operators began to suspect the intervention of spirits. It was at last found that where the line passed by a switch at a railway station the tall iron switch-rod was pushed against it every night at seven o'clock by the switchman who moved the switch for the evening train.

If a large leak should be made in a gas-main under the street, midway between the company's reservoir and the house where the gas was to be consumed, the effects of this unseen leak would be perceived at each end of the pipe, but in different ways. At the gas-works it would be found that the pipe took an unusually strong current; the resistance to the flow of gas in the pipe would be diminished—in other words, the leak would facilitate the escape of the gas—and

hence the degree of pressure which was previously necessary to force the gas through the pipe in a sufficient quantity for the consumer would now drive a much larger quantity. At the other end of the pipe, however, the consumer would find his supply diminished, and if the leak were considerable he might no longer receive enough to give a flame.

These homely illustrations may suggest to the reader the basis of a rude conception of the means by which electricians test for faults. But in the case of electricity the subject dealt with is so delicate in its nature, and the conditions under which it is treated are prepared with such minute exactness and precision, that the computations of distance are expressed in algebraic formulas, and the results attained are often marvelous in their accuracy.

Watching an electrician measuring the resistance of a wire or the force of a current, one might imagine him a chemist weighing some invisible atoms in the most delicate of balances. Before him under a glass case is the slender needle of the galvanometer, and concealed around its base are the two wires through which the divided current is to flow, its parts taking opposite directions around the needle, so that if the current is precisely equally divided between the two wires, the influence of one upon the needle will exactly counteract that of the other, while the slightest excess of one over the other will be instantly shown by a deviation of the needle to the one side or the other, according to the position of the stronger current.

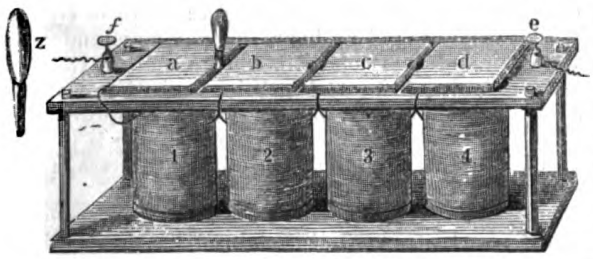

FIG. 22.—RESISTANCE COILS.

The resistance coils (which correspond to the hose in our illustration of the pump) are like the weights of the apothecary. They are arranged under a series of short metallic blocks (*a*, *b*, *c*, *d*, in Fig. 22). If metallic pegs, which are provided for the purpose, are inserted in the holes between these blocks, the current passes directly from *e* to *f* through the connection formed by the blocks and pegs, which constitute so complete a conductor that the resistance is practically nothing. If the peg between two of the blocks be pulled out, the current can not leap the distance between them, and is obliged to pass from the first block through the coil below it to reach the second block. In measuring a resistance, plug after plug is pulled out until the needle is found to rest at zero. The resistances of the various coils that have been brought into the circuit by pulling out plugs are then added together, and they show the total resistance of the line which has been thus balanced against them. It may truly be said, then, that this intangible, invisible, inaudible force is weighed in the scales, and, marvelous as it may seem, it is measured with far greater exactitude than are those tangible and visible substances which men have so long and so familiarly dealt with.

The extreme minuteness of accuracy to which these measurements are carried is seen in the construction of an instrument called the rheostat, which is often used with the resistance coils. An ordinary resistance coil is of unchangeable length. The rheostat is a changeable or adjustable coil. Imagine two spools, side by side—one full, the other empty—with the end of the thread from the full spool attached to the empty one. It is plain that every turn we should give to the empty spool would wind upon it part of the thread, and reduce by so much the number of turns on the full spool. In the rheostat, wire takes the place of the thread, and on the full spool, which is of wood, it lies in a groove, like that on a screw, which isolates each turn from those next it, so that the current can only pass by following the wire from end to end. But the empty spool is a metallic cylinder, and whatever wire is wound upon it becomes, as a conductor, merged in it, so to speak, by the contact, as the current on reaching this cylinder is free at once to pass to the end of the wire, "across lots," with no perceptible resistance. Practically, therefore, the resistance of all the wire that is wound off upon the second spool is nullified. The length of the wire remaining is indicated on a scale with great precision, even to a fraction of a turn of the cylinder.

The amount of resistance is expressed in "ohms," as they are called. An ohm is the unit of measurement of resistance, just as a foot is a measure of length. All telegraph wire is tested for its resistance, as well as for its strength, before it is put up; and all the lines and magnet coils and batteries in use are constantly tested to detect defects.

The more words that can be transmitted in a given time over a line of telegraph, the greater its value, provided the expense of transmission is not disproportionately increased. We have described the sounder which is commonly used in this country. Its use is practically limited by the number

of words a man can write in an hour. A good copyist will not usually write over 800 or 1000 words an hour, but a good operator can receive and write 1500 to 1800 words per hour, and on special occasions 2500 to 2600 have been received. Operators on the continent of Europe do not transmit more than half as many in the same time. The number of words transmitted is increased by the use of the printing instrument to between 2500 and 3000 an hour, which are printed in Roman characters as received, and are ready for delivery, therefore, without the delay of writing out. The operator, by the same movement, can print the message at his own desk and at that of the receiver, and at once detect any error. These instruments are very complicated, easily disarranged, require very skillful operators, a second man or some mechanical power to run them, and a well-insulated line, as the movements at each end must keep perfect time. They are much more expensive than the key and sounder, and are only used on circuits where there is a large and steady business. Their construction is too complicated for description. Printers, as they are called, have never been extensively used in Great Britain, although in use on the main lines of the continent of Europe, where, however, they are not worked as rapidly as with us.

In the "automatic telegraph" a little machine is substituted for the operator, and the message is prepared for it on a strip of perforated paper.

Many different plans have been devised for automatic telegraphing, but only two have thus far proved successful—the Wheatstone, or English system, and the automatic, or American system. The former is extensively used in Great Britain, and a line has been recently constructed between New York and Washington for the working of the latter.

The instruments employed by these two systems are entirely different. In each, holes representing the words of the message are first punched in a narrow strip of paper, which are the equivalents of the dot and dash of the Morse alphabet, and are translated into dots and dashes after transmission. The English puncher has three keys; the first punches two vertical holes, : , representing the dot; the third two holes vertical, but not opposite, ∴ , representing the dash; the centre key simply moves the paper along. The American puncher has a key for each letter, which punches holes representing the dots and dashes of the letter. It is more complicated than the other, but requires less than one-third as many movements of the keys to each letter. The dot is represented by a small hole above the line, · ; the dash by two small holes above and one large one below, ⁚ . It is less liable to mistakes, as the operator is not obliged to translate each letter into dots and dashes before punching. The number of words punched by each is said to be about thirty a minute, or eighteen hundred an hour, the maximum amount an ordinary operator can transmit by the Morse key. No strength is required to work the Morse key, but the punchers require considerable. After the punched slip is prepared the machine transmits the message with great rapidity.

The American transmitting and recording instrument, it is claimed, has greatly the advantage over the English both for its simplicity and rapidity of execution. The English instrument, which is too complicated for description here, can transmit from sixty to 120 words a minute, the number diminishing with the distance. Usually about eighty a minute are sent. It is said that from 1000 to 1500 words a minute can be transmitted by the American instrument between Washington and New York; but if only 500 can be sent, and of this, it is claimed, there can be no reasonable doubt, it may prove a very great improvement over other systems for some purposes.

In the American system, after the paper is punched it goes to the transmitter, is received between pressure rollers, and carried

by the friction on to a small platform of some non-conducting material. A solid cylinder of copper connected with the line wire is inserted in the centre of the platform. Over this cylinder, and resting upon it, is a needle which has two small wheels at one end, and is connected at the other with the wire leading to the battery. The paper passes between the cylinder and needle, and is carried off by another set of pressure rollers. The circuit is broken by the paper, and closed when the holes in the paper pass under the wheels and the wheels come in contact with the copper cylinder. Where there is a cluster of three holes both wheels form a contact and a dash is transmitted, in other cases a dot.

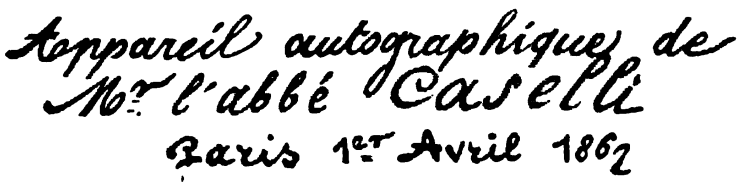

FIG. 25.—AUTOGRAPH TRANSMITTED BY CASELLI'S APPARATUS.

The same instrument answers for a receiver. The message is recorded on chemically prepared paper, rendered sensitive to the slightest current. Occasional errors arise,

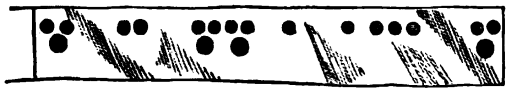

FIG. 24.—MESSAGE PREPARED FOR AUTOMATIC TELEGRAPH.

caused by the dot running into the dash and the dash into a straight line, and can not be detected until the message is translated, so great is the rapidity of transmission; and when they do occur the whole message must be repeated.

Punching instruments can be readily constructed and furnished to those who have frequent occasion to use the telegraph, and a clerk can easily punch the telegraphic letters, and thus greatly lessen the expense of sending a long message. On the other hand, it is to be considered that the aggregate of time employed is a considerable offset. In England the automatic system is regarded as indispensable for press messages, for which purpose messages are punched in triplicate, and the same ribbon is used again and again in distributing the message by different instruments in all directions. It is said to be doubtful, however, to what extent great rapidity can be maintained on lines which have more than one wire, for whenever a current is flowing over one wire it induces another current in the other wire at each opening and breaking of the circuit; hence if messages are passing on both wires there is a liability of both being received on each line, and rendered unintelligible. This instrument is not as complicated as the printer, but requires more operators, and is therefore more expensive.

Another very curious and complicated transmitter, used in France, is an autographic instrument by which the *fac-simile* of the handwriting can be produced at any other office where a similar instrument is used. It is especially useful for messages relating to transfers of money, as it affords the receiver an opportunity to test the authenticity of the dispatch by the *fac-simile* of the sender's signature. It is said that on an average nearly thirty messages an hour can be transmitted by it. The message is written on chemically prepared paper, and the price varies with the size of the paper.

This instrument can transmit stenographic writing, and then its rapidity is said to be truly prodigious. Portraits and drawings can also be transmitted by it.

This seems almost incredible. But the reader who has followed the explanations before given can form a general idea of the process by imagining that two great pendulums are made to swing simultaneously, one at either end of the line. Each moves a metallic point back and forth over the surface of chemically prepared paper, and after every movement the position of the pencil is changed a hair's-breadth down the page. If, then, at the instant that the metallic point at one terminus is in contact with a line of the manuscript or copy, a telegraphic current is transmitted to the point at the other terminus, and passes thence through the paper, it will produce a discoloration, which will be a dot or a line according to the duration of the current. If the autograph be closely inspected, it will be seen that it is made up of very fine parallel lines. The same thing will be more clearly seen in the butterfly, shown on a previous page.

The most recent marvel of the telegraph is what is called the duplex telegraph. This invention is a simple and beautiful device by which one wire serves to carry two messages in contrary directions at the same instant without interference. At first thought this may seem an impossibility; but when we consider how sounds, which we know to be vibrations in the air, may be propagated together in almost any number, and pass and cross each other in opposite directions without losing their individuality, we see how it is possible, even if we conceive of two currents as flowing in contrary directions, that currents of electricity, or rather, we should say, the vibratory action and reaction which we term currents, should coexist and interlace without interference. In the ordinary

arrangement of a telegraphic circuit, if the operator at New York should commence to send a message to Philadelphia at the same time that the Philadelphia operator was sending to New York by the same wire, confusion would result. On the theory of two currents even, perhaps this confusion would not, under proper conditions, be an interference of the currents in the wire; but if they remained distinct, there would be confusion in the double and broken utterance of the receiving instruments. The distinct currents would both pull upon the armature of the sounder, and the result would be a confusion in the signals. The instruments at each end would utter an unintelligible jargon. To obviate this difficulty some device is necessary which shall cause the current from the battery at either end to flow through the magnet at the same end without affecting it, but yet have its effect on the magnet at the other end. After the current from the transmitting office passes through the key by which the signals are made, the wire is divided into two, one of them leading to the magnet and thence to the main line, while the other leads also to the magnet and thence back to the negative pole of the battery. To prevent too much of the current from following the latter course, which, being very short, presents but little resistance, resistance coils such as have been described are inserted in this short line, and when, by means of these, the resistance is made equal to that of the main line, the current divides equally, one-half passing forward to the main line to carry the message to the other terminus, the other half returning to the battery through the equally difficult path of the resistance coils. The magnet in question has both these wires wound around it in opposite directions, the consequence of which is that the half of the current which is returning to the battery counteracts the influence on the magnet which would otherwise be exerted by the other portion which is going forward on the line, and the outgoing message therefore produces no effect on the magnet. When the part of the current which carries the message, so to speak, arrives at the similar arrangement at the other end of the line, it passes around the magnet there without any such counteracting influence, and therefore makes its signals freely. In other words, the duplex telegraph is a contrivance for dividing the current, and using one-half of it to send the message, and the other half to keep the sounder from being disturbed by the message, thus leaving the sounder free to utter another message which is coming at the same time from the other end of the route.

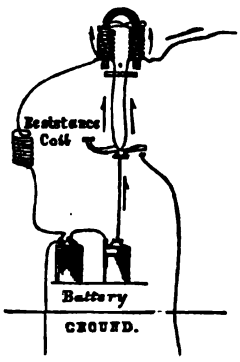

FIG. 26.—PRINCIPLE OF THE DOUBLE TRANSMITTER.

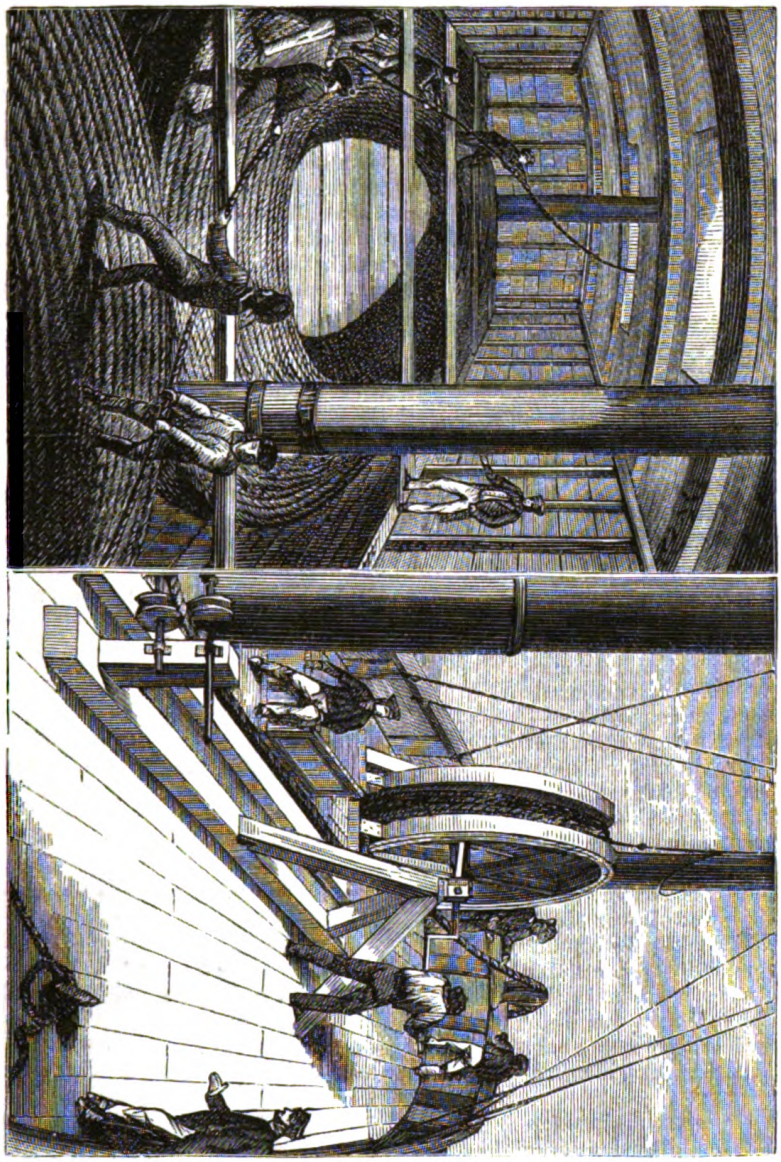
The American lines are connected with those of the Old World by cables. The cable is an insulated copper wire, surrounded by iron wire, covered with hemp and a thick coating of cement, as it was feared that the crustacea inhabiting the ocean depths might eat through this coating. These creatures were carefully analyzed, and a compound made so hard that they could not act upon it.



The story of the laying of the cable has been often told, and need not be repeated here. The peculiar conditions of submarine telegraphy required the use of batteries of very small power. The current was then found to be so inconstant in its movement that the needle could not be relied upon to open and close a local circuit, while its tremulous movements were so slight that they could not be followed by the eye. We have said that the time required by a current of electricity for its passage through a conductor is directly proportional to its length, other things being equal; but in the case of cables other causes of retardation are added. The current flowing through the cable induces a temporary current in the reverse direction on the outside of the conductor, and the attraction between the two retards the current, and this retardation increases in a geometric ratio with the length of the cable. The cable becomes, in effect, an enormous Leyden jar, the wire constituting the interior, the water the exterior coating, with the gutta-percha insulator between. When the circuit is closed the jar is charged, and discharged when it is opened. This also causes delay. The current moves as a wave which gradually travels along the wire, appearing in different parts at successive intervals of time; and by adjusted touches of the key successive waves may follow each other through the wire before the first has died away. If the battery be too large, the cable will be destroyed; if too weak, the signal is too fleeting to be seen without prolonging the wave to such an extent as to prevent rapid transmission. To remedy these difficulties a very delicate and beautiful form of the galvanometer was invented. It consists of a mirror of microscopic glass about one-eighth of an inch in diameter, suspended by a silk thread in the centre of a coil of very fine wire. A magnet is attached to the back of the mirror made of thin watch-spring. The whole weighs less than a grain. The magnet is so sensitive that if the ends of the wire connecting the coil are held by the hands, one end being covered with tin-foil, there will be sufficient magnetism excited to deflect the needle. If a current equal in strength

to that produced by a knife blade when brought near a magnetic needle is received, it will move the magnet. A shaded light is thrown on the mirror, which is reflected upon an ivory scale, and is brought to a sharp focus by the lens. The instant the circuit is closed the magnet and mirror are deflected, and the light moves to the right or left on the scale, as the current is positive or negative. A very minute displacement of the magnet gives a very large movement of the ray of light. A movement on one side of the zero point represents the dot, on the other the dash, of the Morse alphabet, and the interval between the two the space. Before the first element has been received a second and even a third are following in its wake. Thus the thoughts of the East are read in the West by the flickering of a reflected ray of light.

Very recently a registering instrument has been invented as a substitute for the galvanometer. It consists of a small glass tube, which waves to and fro over a running strip of paper without touching it. The ink is spurted upon the paper by a series of electric sparks in a fine shower, which makes a continuous line upon the paper, giving a faithful record of the motion of the current. This instrument nearly quadruples the speed with which messages can be transmitted over the cable, it being capable of recording 120 words a minute, while the mirror galvanometer receives about thirty.

There is, perhaps, no more wonderful example of organization, subordination, and

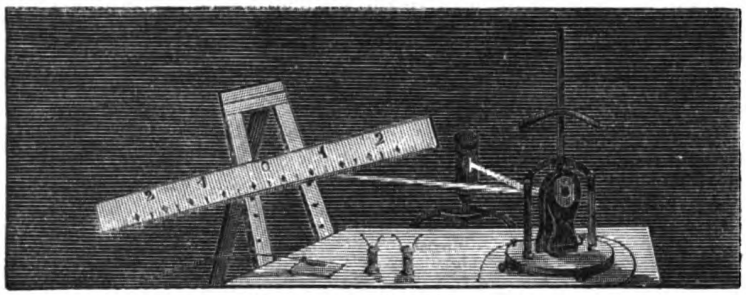

FIG. 27.—THE MIRROR GALVANOMETER.

intense attention and celerity to be found in any department of human affairs than is afforded by the telegraphic service between London and New York. A message sent from New York has to be rewritten four times in its route—that is to say, four times

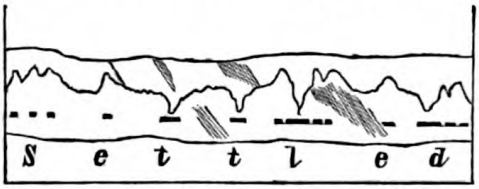

FIG. 28.—A REGISTERED CABLE MESSAGE.

it has to leave the wires and pass in at the eye or ear of an operator, through his mind and by his hand on to paper, or on to the transmitting instrument, or both. These faithful servants of the public, sitting continuously at their posts hundreds and thousands of miles apart, maintain an incessant stream of such communications with such perfect discipline and unbroken attention that the average time for the entire operation, including all kinds of messages, however long, is less than fourteen minutes for each message from New York to London. This, too, is but one short line in a net-work of over seven hundred thousand miles of wire which covers the globe, uniting more than twenty thousand cities and villages in every continent and of every language in one vast organization incessantly in operation.

Almost every season brings forward some new application of the telegraph. A complete net-work of wires now connects the stock exchange with the brokers' offices and the leading hotels, and the business done at the board is printed off in more than a thousand places in New York simultaneously. There is no reason why it should not be employed in a similar way to communicate to the offices of lawyers the progress of proceedings and the call of the calendar in the courts of law. What is called the district telegraph has recently been established in New York. It is a house-to-house telegraph, with a central office in each of a number of convenient districts. Each subscriber pays two dollars and a half a month, for which the company put up a neat little instrument in any part of his house that he desires, by means of which he can at any hour of the day or night summon to his door within the space of three minutes a messenger, a policeman, or a fireman with a fire-extinguisher. For the service of either he is to pay fifteen cents a half hour for the time employed. This system is spreading very rapidly and successfully throughout the city.

Railroad companies are now very generally employing telegraph operators as train dispatchers, and the incessant use of the telegraph is becoming a necessity on every road. Private telegraphs are used by many business houses for communication between the warehouse and the factory, and by gentlemen in their country residences to summon the coachman from the stables and the

porter from his lodge. There are said to be over four thousand miles of private telegraphs in Great Britain. How many there are in this country we are not informed. In hundreds of public buildings and churches miniature telegraphs are used for lighting

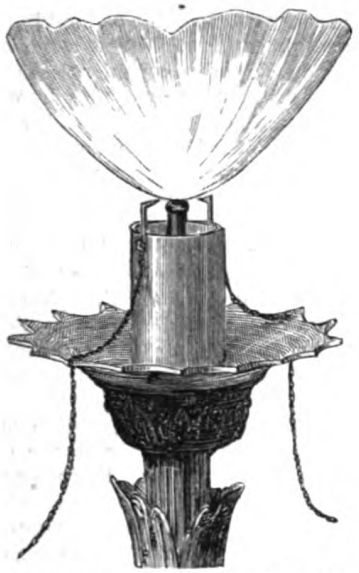

FIG. 29.—LIGHTING GAS BY THE ELECTRIC SPARK.

the gas, and it is estimated that the expense of the apparatus for a large church is repaid in two years by the saving in gas, as compared with the common and wasteful way of turning on the gas and then lighting one burner at a time with a rod and torch.

One of the most curious applications of the telegraph is its use in surgery to discover a bullet in a wound. The probe and forceps are each connected with a delicate battery. When one point of the probe or of the forceps touches the ball no effect is produced, but when both touch it the ball completes the circuit, and the tinkling of a bell

FIG. 30.—THE ELECTRIC PROBE AND FORCEPS.

or the vibration of a spring shows the surgeon that he has seized it.

The immense extension of the general telegraphic system, and its common use for business and social correspondence and the dissemination of public intelligence, are far more important to the community than any of these incidental applications of the system. The telegraph system is extending much more rapidly than the railroad system, and is probably exerting even a greater influence upon the mental development of the people than the railroad is exerting in respect to the material and physical prosperity of the country. It has penetrated almost every mind with a new sense of the vastness of distance and the value of time. It is commonly said that it has annihilated time and space—and this is true in a sense; but in a deeper sense it has magnified both, for it has been the means of expanding vastly the inadequate conceptions which we form of space and distance, and of giving a significance to the idea of time which it never before had to the human mind. It lifts every man who reads its messages above his own little circle, gives him in a vivid flash, as it were, a view of vast distances, and tends by an irresistible influence to make him a citizen of his country and a fellow of the race as well as a member of his local community.

In other respects its influence, though less obvious, will probably prove equally profound. So long as the mysterious force employed in the telegraph was only known in the mariner's compass, or by scientific investigations, or in a few special processes of art, the knowledge of the electric or magnetic force had, so to speak, a very limited soil to grow in. By means of the telegraph many thousands of persons in this country are constantly employed in dealing with it practically—generating it, insulating it, manipulating it. The invention of Morse has engaged some one in every considerable town and village in studying its properties, watching its operation, and using it profitably. Nothing could be better calculated to attract general attention to this newfound power, and to disseminate that knowledge of it from which new applications may be expected to result.

The tendency of scientific pursuits to promote the love of truth and the habit of accuracy is strikingly illustrated in the zeal and fidelity with which the minute and long-continued investigations have been pursued that have led to the development of this new realm of knowledge and this new element in human affairs.

But perhaps the most extended and important influence which the telegraph is destined to exert upon the human mind is that which it will ultimately work out through its influence upon language.

Language is the instrument of thought. It is not merely a means of expression. A word is a tool for thinking, before the thinker uses it as a signal for communicating his thought. There is no good reason why it should not be free to be improved, as other implements are. Language has hitherto been regarded merely in a historical point of view, and even now philol-

ogy is little more than a record of the differences in language which have separated mankind, and of the steps of development in it which each branch of the human family has pursued. And as a whole it may be said that the science of language in the hands of philologists is used to perpetuate the differences and irregularities of speech which prevail. The telegraph is silently introducing a new element, which, we may confidently predict, will one day present this subject in a different aspect. The invention of Morse has given beyond recall the pre-eminence to the Italian alphabet, and has secured the ultimate adoption throughout the world of that system or some improvement upon it. The community of intelligence, and the necessary convertibility of expression between different languages, which the press through the influence of the telegraph is establishing, have commenced a process of assimilation, the results of which are already striking to those who carefully examine the subject. An important event transpiring in any part of the civilized world is concisely expressed in a dispatch which is immediately reproduced in five or ten or more different languages. A comparison of such dispatches with each other will show that in them the peculiar and local idioms of each language are to a large extent discarded. The process sifts out, as it were, the characteristic peculiarities of each language, and it may be confidently said that nowhere in literature will be found a more remarkable parallelism of structure, and even of word forms, combined with equal purity and strength in each language, than in the telegraphic columns of the leading dailies of the capitals of Europe and America. A traveler in Europe, commencing the study of the language of the country where he may be, finds no reading which he can so easily master as the telegraphic news column. The telegraph is cosmopolitan, and is rapidly giving prominence to those modes of speech in which different languages resemble each other. When we add to this the fact that every step of advance made by science and the arts increases that which different languages have in common by reason of the tendency of men in these pursuits the world over to adopt a common nomenclature, and to think alike or in similar mental processes, we see the elements already at work which will ultimately relegate philology to its proper and useful place among the departments of history, and will free language from those restrictions which now forbid making any intentional improvements in it. With the general use of the telegraphic system other things begin to readjust themselves to its conditions. Short-hand writing is more cultivated now than ever before. The best reporter must understand both systems, and be able to take his notes of a conversation while it passes, and then by stepping into an office transmit it at once without writing out. There is now in practical use in the city of New York a little instrument the size of a sewing-machine, having a key-board like the printing telegraph, by which any one can write in print as legibly as this page, and almost as rapidly as a reporter in short-hand. When we consider the immense number of people that every day by writing a telegram and counting the words are taking a most efficient lesson in concise composition, we see in another way the influence of this invention on the strength of language. If the companies should ever adopt the system of computing all their charges by the number of letters instead of words, as indeed they do now for all cipher or unintelligible messages, the world would very quickly be considering the economic advantages of phonetic or other improved orthography.

These processes are in operation all the world over, and in reference to the use of one and the same alphabet. By the principle which Darwin describes as natural selection short words are gaining the advantage of long words, direct forms of expression are gaining the advantage over indirect, words of precise meaning the advantage of the ambiguous, and local idioms are every where at a disadvantage. The doctrine of the Survival of the Fittest thus tends to the constant improvement and points to the ultimate unification of language.

The idea of a common language of the world, therefore, however far in the future it may be, is no longer a dream of the poet nor a scheme of a conqueror. And it is significant of the spirit of the times that this idea, once so chimerical, should at the time we are writing find expression in the inaugural of our Chief Magistrate, in his declaration of the belief "that our Great Maker is preparing the world in His own good time to become one nation, speaking one language, and when armies and navies will be no longer required."

ON THE BRIDGE OF SIGHS.

By ELIZABETH STUART PHELPS.

It chanceth once to every soul
Whose mystic scrolls illuminate enroll

The hieroglyphics of a peace
Which was the ransom of a pain's release,

Upon life's Bridge of Sighs to stand,
"A palace and a prison on each hand."

O palace of the rose-heart's hue!
How like a flower the sweet light fell from you!

O prison with the hollow eyes!
Your steadfast look reflects no flower's surprise.

O palace of the rose-sweet sin!
O blessed prison that I entered in!

THE CHILDREN'S CHURCH.

[FROM THE GERMAN OF PAUL GEROK.]

THE bells of the churches are ringing—
Papa and mamma have both gone—
And three little children sit singing
Together this still Sunday morn.

While the bells toll away in the steeple,
Though too small to sit still in a pew,
These busy religious small people
Determine to have their church too.

So, as free as the birds, or the breezes
By which their fair ringlets are fanned,
Each rogue sings away as he pleases,
With book upside down in his hand.

Their hymn has no sense in its letter,
Their music no rhythm nor tune:
Our worship, perhaps, may be better—
But *theirs* reaches God quite as soon.

Their angels stand close to the Father;
His heaven is made bright by these flowers;
And the dear God above us would rather
Hear praise from their lips than from ours.

Sing on, little children—your voices
Fill the air with contentment and love;
All nature around you rejoices,
And the birds warble sweetly above.

Sing on—for the proudest orations,
The liturgies sacred and long,
The anthems and worship of nations,
Are poor to your innocent song.

Sing on—our devotion is colder,
Though wisely our prayers may be planned,
For often we, too, who are older,
Hold *our* book the wrong way in our hand.

Sing on—our harmonic inventions
We study with labor and pain;
Yet often our angry contentions
Take the harmony out of our strain.

Sing on—all our struggle and battle,
Our cry, when most deep and sincere—
What are they? A child's simple prattle,
A breath in the Infinite Ear.

MADAME DE SÉVIGNÉ AND HER CONTEMPORARIES.

MARQUISE DE SÉVIGNÉ, AT THE AGE OF TWENTY-FIVE.

THE granddaughter of a saint, the daughter of a hero cavalier, the pupil of a priest, and the wife of a reprobate, Madame De Sévigné possessed in her family surroundings more than sufficient to create a romantic interest, even if she were not herself one of the most striking characters of the seventeenth century, and had not, with her vivid and felicitous pen, contributed a knowledge of her contemporaries to history. Her beauty, her animal spirits, her clear perception, her brilliancy as a belle, and her sagacity as a woman carried her triumphantly through a dazzling, seductive, and picturesque period of French history, and enabled her, in depicting it for private reading, to use the same lights, so to speak, that illuminated the side scenes at the court, and the motives, rumors, and knowledge which moved but, to the outside world, did not disturb "society." It is impossible to contemplate Madame De Sévigné apart from these contemporaries or out of this society. She belongs to both, did much to make and give a character to both, and, to her great credit be it said, is one of the very few exceptional characters to be found in the history of either. While the morals and manners of the time may account for and palliate her peculiarities, even a brief acquaint-

ance with her ancestry will indicate the source of her strongest characteristics—eloquence, patience, purity, and spirit—as well as the possession of some weaknesses good training enabled her to control, and others which, escaping her, were nevertheless apparent in her offspring.

Jeanne-Françoise Rabutin de Chantal (*née* Frémyot), after ten years of struggling widowhood, severed the domestic ties which bound her to four helpless orphan children, to link herself with what she deemed a higher duty, left her home in 1610, and, under the influence of St. Francis de Sales, became the founder of the Order of the Visitation. In her day she built some eighty convents, and in after-times was canonized. It took a marvelous courage to thus rend the dearest ties of nature, and to step over the body of her young son, who, lying prostrate across the threshold of the old château of Bourbilly, with words and tears of supplication, passionately but vainly implored her to forego the design which was to leave him motherless as well as fatherless.

The boy thus doubly orphaned, young Celse-Bénigne Rabutin de Chantal, fourteen years old, was taken to the house of his maternal grandfather, president of the Dijon Parliament, where he grew up to manhood, and became distinguished for many graces of mind and person. Elegant yet blunt, impetuous yet playful, proud yet lively, intrepid, rash, and passionate, he was a model cavalier, who, in addition to the needful physical attributes, possessed a notable faculty of peculiar and attractive speech, which, it is said, made his conversation a pleasure, the charm of which lay as much in his grace of manner as in felicity of fancy; while, however, the fascination of his tongue made him an accomplished favorite, the impetuosity of his temper brought him into continual jeopardy. It was the nature of his blood to be at the fever-heat of gallantry, and the customs of the period were not calculated to assuage it. His father, a man of war, had set him an active example of a life of hazard, and left him a legacy of peril. Having proudly carried many wounds received under "the white plume of Navarre," which brushed away the claims of Cardinal de Bourbon and established Henry IV. on the throne, having escaped through many battles and fought eighteen duels, he met an untimely and accidental death. Excelling his father in the polite arts, the young Baron de Chantal almost rivaled him in cavalier gallantry. He had *his* duels and hi[illegible]'s duels to attend to, and one of th[illegible] suggestively illustrates his ac[illegible] ceives additional interest from th[illegible] nces which resulted from it.

[illegible] young baron was married to M[illegible]ulanges, daughter of a "Conseiller [illegible]," etc., which elevated connection might reasonably tend to somewhat calm down the troublous currents of his vivacious intrepidity; but it was not so, for on the Easter-Sunday of that very year, and in the church where he had just partaken of the Holy Sacrament, he received a summons to second a friend in a combat about to take place at the Porte St. Antoine. Chantal hurried from the church to the dueling ground, from the solemnities in which he had been a participant to the delusive sophistries of the "code of honor." The scandal caused by this Easter-day conflict was intense, the result disastrous; prosecutions ensued, and Chantal was compelled to take shelter in temporary obscurity. When, deeming the storm abated, he ventured to appear at court, it was to feel that the chilling glance of Louis XIII. and the frowns of the cardinal, Richelieu, shut out all future hope of court sunshine on his path. The king and the cardinal could check the desires of the courtier, but they could not dampen the ardor of the cavalier. They might interfere with the fortune of the former, but could not deny the latter the glory of defending his country. In this defense Chantal was slain, in July, 1627, bravely fighting against the English, who had effected a landing on the Ile de Rhé. Thus died, after a brief career, full of talent, bravery, and promise, the son of Sainte Chantal, and the father of Madame De Sévigné, then an infant.

The little child orphaned by the carnage at the Ile de Rhé was not yet eighteen months old, having been born at the Place Royale-du-Marais on the 5th of February, 1626, during the days of her father's disfavor at court. Greatly needed, indeed, was the prayerful injunction of Sainte Chantal on this occasion to her weeping daughter-in-law, whose situation and sorrows could not fail to conjure up a sad similitude to her own early tribulations. "Be careful of yourself, my dearest daughter," she wrote. "Keep yourself to bring up in the fear of our Lord this offspring of a holy wedlock. Guard her as a trust, without allowing your affection to be too greatly attached, so that the Divine Goodness may take a greater care of and be all things to this dear little child." With what a singularly sympathetic idea of the state of affairs did not the pious Mother Chantal express herself, betraying a fear for the health of the young widow, and in this fear seeing the greater need of the Divine Goodness to be all things to the dear little child! Her anxieties were not overdrawn. In six years the dear little child had no mother. Her grandam Coulanges then supplied the place, but she, too, passed away in a twelvemonth. Grandpa Coulanges followed his daughter and wife in a few years, and then a family council of the Rabutins and Coulangeses was held to determine what should be done with the dear little one—who

would become guardian to the young orphan Marie de Rabutin-Chantal. The "Divine Goodness" guided the choice, which fell to the lot of her mother's brother, Christophe de Coulanges, Abbé of Livry, then but twenty-nine years old, but who proved himself eminently worthy of the trust.

Marie was now transplanted to the old priory of Livry, in the forest of Bondy. In this sweet solitude the sorrows and anxieties which had invaded her young life were dispelled. Peace and care set in motion the great faculties with which Providence had blessed her. Seeing what nature had done for his little niece, the good abbé brought all the influences of integrity, prudence, and solid learning to strengthen her heart and enrich her brain. From him she was schooled in what she calls "the holy virtue of economy," and to a true estimation of the worthlessness of ostentation and extravagance. His teaching and sedulous care developed that perfect good sense on which, as her latest biographer* truly says, reposes the genius of Madame De Sévigné. The strength of character thus formed saved her from temptations which fashion did not condemn, and from errors which beaux and belles deemed triumphs, at a later period, and in a state of society where she was a flattered inspiration. Destined by her birth and connections to move amidst the triumphs and dangers of the court and court circles, the abbé, with the most watchful solicitude, prepared her for the achievement of the one, and fortified her against the other. Hence her education was brilliant as well as solid, all the arts and fasciuations of polite literature being woven round, and keeping, perhaps from unnecessary prominence, until needed the solid erudition and strict principles of integrity which lay at the foundation of all his precepts.

While the uncle tutored Marie in Greek, Latin, and the graver studies, she was instructed in Italian, general literature, poetry, and the light artillery of accomplishments by the Abbé Ménage—a man of wit and many tongues, whose susceptibility soon succumbed to the attractions of his pupil—and John Chapelain, author of a long-winded but short-lived poem, *Pucelle*, a man of capacity, who, although not insensible to Marie's grace and wit, kept most of his enthusiasm for his own muse and her indifferent offspring. He was, however, among the earliest and most earnest defenders of his pupil in time of need.

What delightful days were those in the forest of Bondy! How happily and beneficially her days of girlhood passed, guided by love and judgment, nurtured by enjoyable studies, calmed by the surrounding aspect of nature, or pleasantly sporting in the gardens of the priory with her cousin Emmanuel—"le petit Coulanges"—who afterward was known as the jovial *raconteur*, the comedian of society, full of song, story, sentiment, enhancing each by the acted expressiveness of his rendition—whose tendency to the comic was so irresistible that he could not even suffer seriously, but while screaming with the pangs of the gout, did it, says Madame De Sévigné, as if it were a joke. The blessings of Livry were never forgotten by Marie. Her uncle's care was the source of eternal thanks. He lived long, for half a century was her best friend and counselor, and throughout her career she yearned toward him with increasing affection, reliance, and gratitude.

When Marie, at the age of seventeen, left Livry, and was introduced into Parisian circles, she at once created a sensation. The variety of her attainments surprised all. Witty with the wits, scholastic with the erudite, beautiful among beauties, grave or gay, and with a charm of manner that attracted confidence and dispelled rivalry. At this period she was distinguished by a brilliant clear complexion, with hair to suit, fair, thick, and wavy, fresh and rosy lips, and a fine figure. She often expressed dissatisfaction with her nose, which was somewhat square, as was the contour of her jaw; but the smoothness of her dazzling skin, the beauty of her blue eyes, now aflame with the fire of wit, now prayerful under the inspiration of tenderness and feeling, and the general unchecked animation of her features, made the pupil of Livry eminently attractive. In addition to her heavenly eyes and golden hair and rich brain, the bright Burgundian beauty was an heiress. It is almost needless to say that wit, worth, and wealth conspired to make the possessor—that possessor a girl—a bait of unusual splendor, and that Mademoiselle De Rabutin-Chantal was very quickly the centre of a worshiping circle of suitors and admirers. Among these suitors then, and subsequently under less reputable circumstances, but always unsuccessful, was her cousin Bussy-Rabutin. Henri, Marquis de Sévigné, of a noble Breton family, became the chosen competitor, his success being due, it is thought, to the mediation of his uncle, the famous Paul de Gondi, Coadjutor Archbishop of Paris, then deemed the most rising man in French affairs, and soon to be known as the Cardinal de Retz, and the soul of the Fronde.

There is no reason to doubt that Mademoiselle Chantal loved M. De Sévigné, and wed him of her free will and choice; however, his connection with so rising a man as De Gondi may have had its effect in making the Abbé de Coulanges solicitous for the match. Young and handsome, with the

light of a lover illuminating a naturally gay disposition, it is not wonderful that De Sévigné's baser characteristics were a blank to the dazzling Marie's want of worldly experience, especially when those around her did not take pains to analyze too closely the nature of one whose powerful connections gave promise of future prominence in the state.

She was affianced when scarcely eighteen years old, was to be married in the merry May time, but an ebullition of De Sévigné's temper postponed the nuptials for some three months. Crossing the Pont Neuf, he met a Breton gentleman who had "spoken to his discredit." He struck him with the flat of his sword: a meeting ensued, and the marquis was dangerously wounded. He survived, and on the 4th of August, 1644, Marie de Rabutin-Chantal became the Marquise de Sévigné—the possessor of a name which her virtues and talents were to immortalize. She was the victim of the duello. She was born in the days made gloomy by its results. It changed the May days which were to have been those of her honeymoon into sad anxiety over the couch of her betrothed. In a few years it was to consign her to a perpetual widowhood.

The young pair, possessing all that could make life desirable, went soon after their marriage to The Rochers, their home in Brittany. Having enjoyed a life of tranquillity and apparent happiness for some eighteen months, they returned to Paris in the middle of 1646, and on the 10th October following the marquise gave birth to that daughter upon whom she lavished so much anxiety and affection.

Now the youthful marquise found herself in the midst of all that was pleasant and agreeable in Paris. The Hôtel de Rambouillet, with its happy innovations on the prevailing style of architecture, having the windows opening to the ground, and into the garden, which extended back to the Carrousel and the Tuileries, was the chief theatre dedicated to pleasure and intelligence at the time. Madame De Rambouillet having been early afflicted with a malady which compelled her to shun both fire and sunlight, made a great virtue of this necessity, took to her *ruelle*,* and attracted around her a circle of brains and beauty, with a fringe of rank, fashion, and varied ability. At the time of Madame De Sévigné's *rentrée* into Parisian society Madame De Rambouillet was fifty-eight years old. By birth a Roman, she was married at twelve, retired from the pleasures of the Louvre at twenty, and initiated the gatherings which have made her name and hotel famous. In her youth French society was uncouth, French manners rough. She set out to tame the one and polish the other, and she had the good sense to see and feel that intellect, and not birth or rank, was the touch-stone of the needed reformation. Talent and good manners, therefore, were the leading passports to her favor and society. A woman of refinement, purity, taste, and appreciation, she gave encouragement and approval where it was most beneficial without creating rivalries by partisanship, which was a very difficult position to maintain.

Mademoiselle De Scudéry, the manufacturer of mammoth romances, occupying half a score volumes each, at an early period made one of the select circle of the Hôtel de Rambouillet, and has given us a description of its mistress, under the name of Cléomire, in her elaborate manner, a passage of which, as a *résumé* of all, must suffice: "If there was a wish to embody Chastity," writes the worshipful Scudéry, "I would give her the aspect of Cléomire; to make Glory loved by all, I would again represent Cléomire; and if Virtue took a human garb, it must be that of Cléomire." Madame De Rambouillet was assisted in her receptions by her daughters, Julie and Angélique, especially the former, who for twenty years was the inspiration of poets, the worshiped of men, and even of women, whose amiability was such that she discouraged lovers without displeasing them. Madame De Sablé used to say, probably to tease her friend's male worshipers, she could conceive no greater felicity on earth than to spend her life with Mademoiselle De Rambouillet. Brought up in the pleasures of her mother's circle, and the concentrated sentimentality which led to later and less platonic extravagances in gallantry, Mademoiselle Julie was a faithful illustration of both. She felt so happy in being adored as a sort of movable shrine that she resisted all offers of marriage, and only yielded to her mother's wishes when she was *passée*, and recompensed the Marquis de Montausier, who had been prostrate at her feet for fourteen years.

From a familiar affectation in addressing each other as "*ma précieuse*," the most distinguished coterie of the Hôtel de Rambouillet became known as *Les Précieuses*, a name retained by Molière in his comedy in which he so severely ridiculed these followers. Madame De Rambouillet certainly contributed much to transform the rough manners of the early days of the seventeenth century, but her coterie went from one extreme to the

* "The bed, at that time monumental and magnificently adorned, stood in the centre of one end of the room, and for princesses and ladies of high quality it was raised from the ground by a few steps, called the *estrade*. Near the foot of the bed, and dividing the apartment, stood a gilt balustrade, such as may still be seen in the room of Louis XIV. at Versailles. Each side of the bed within that reserved space was called the *ruelle*; it was often still more inclosed by a colonnade reaching from the ground to the ceiling, and it then formed an alcove."—*Comtesse de Puliga*, p. 41.

other. Rushing from rude customs, it assumed classic names, cultivated a painfully turgid platonism, and encouraged to an absurd extent the forms of gallantry while discountenancing its spirit. Under this system society became stilted and sentimental to a morbid degree, and language was used not so much for its point as for its color, not for the reality of its meaning, but for its suitability of sound and picturesqueness of form. Mademoiselle De Scudéry, "the incomparable Sappho" of the blue-stockings, has left us a picture of the morals and manners of this society, without an outline at least of which it is impossible to understand much of the spirit of that era.

Love was the rule—a necessity of good-breeding. All men should be enamored, and all women loved. Indifference was such a reproach that those who were not, pretended to be in love. Custom did not require women to love, but only to suffer to be loved, while, however, they were not forbidden to acknowledge the perseverance of their lovers by an affection perfectly pure. They were permitted "to employ innocent artifices to subdue the hearts of men," as all a woman's glory consisted in making illustrious conquests; and holding the lovers she subdued. It was correct to treat lovers with great rigor, but also a necessity to be abounding in charms, artifice, and amiability to overcome the possible cold results of that rigor. Thus every belle had to be sufficiently cold to chill the ardor of gallantry without freezing it, and sufficiently coquettish to encourage without inflaming it; she was to check and to cheer it at the same time. To be an *honnête homme*, as the phrase went, a perfect gentleman in society, was to be brave, witty, gallant, making eternal love or love speeches, and paying homage to some lady who accepted, "and whose good name was by no means sullied by it." In this way the "incomparable Sappho" thought the *beau monde* of her day had discovered how "to blend innocence and love," and the mode of spending "a life at once agreeable and diverting."

The Hôtel de Rambouillet became a sort of inner temple, where these doctrines were worshiped and promulgated. Even royal princesses waived custom in favor of this centre of Parisian civilization. All the poets, wits, philosophers, and statesmen, all the belles and beaux of the time, assembled in and around the *ruelle* of the "incomparable Arthénice," as the elegantly tranquil madame was styled. Here Mazarin played cards and Balzac had his group of listeners; here La Rochefoucauld made "maxims" and Ménage discussed foreign verses; here Gondi remembered he was a swordsman and gallant before he took orders; here came Foucquet, "the financier," and St. Pavin and Montreuil, making bonmots and complimentary verses; here "le petit Coulanges," the Yorick of every salon, set the blue room in a roar, while Bussy-Rabutin was doubtless pushing an intrigue; here Chapelain "deigned to read some fragments of his long-expected *Pucelle*;" here Voiture, the audacious, with his verses and vividly felicitous impromptus, was most welcome of all; and here, greatest of all, Pierre Corneille received a warm greeting; but his serious and quiet manners were in tame contrast to Voiture's self-sufficient brilliancy, and not calculated to make him, as Madame De Motteville has it, "an ornament of the '*belles ruelles*.'" He read betimes, in his timid way, passages from those tragedies of which it has been said that all the heroines are Frondeuses, but was oftenest silent. "Seated on one of the low stools reserved for those of inferior birth, he allowed the minor luminaries to chatter and please."

Of course the high-sounding sentimentality and artificial gallantry of *Les Précieuses* could not be sustained forever. Flesh and blood could not stand it. As time progressed the real invaded the artificial, and society gained something in the way of nature and lost considerable in the way of character. Not that nature and character were incompatible, but "society," in forming its character, had so fooled nature that the latter, watching its occasion, and using the forms of fashion to reassert itself, found sentimental innocence a bait for intrigue, and artificial simplicity a susceptible clew to scandal. Thus jaunty scheming took advantage of sentiment, and gallant blacklegs mingled with the blue-stockings of the blue room of the Hôtel de Rambouillet. Instead of pretending to be in love *à la mode*, beaux ran each other through for a smile or a frown; real love intrigues bourgeoned out of the apparently barren soil of artificial admiration, until society became that cavalier, verse-making, verse-loving, love-making, letter-writing, salon-gathering, witty, reckless, audacious, rival-hating, and intriguing aristocracy that greeted Madame De Sévigné. It is just to remark that the mistress of the Hôtel de Rambouillet came through an era of intrigues unsullied; "in no pamphlet of that period does one word tarnish her fame."

Young as she was, Madame De Sévigné was neither absorbed nor carried away by the society of the Hôtel de Rambouillet. She was as far removed from pedantry as prudery, and retained only such of the ruling principles as were elevating. While her sprightly humor and zest for amusement were captivating, her sense and modesty were self-preservative. She was not only an attraction at the Hôtel de Rambouillet, but she had a little court of her own, and was surrounded by suitors. Among these were her handsome, brilliant, and treacher-

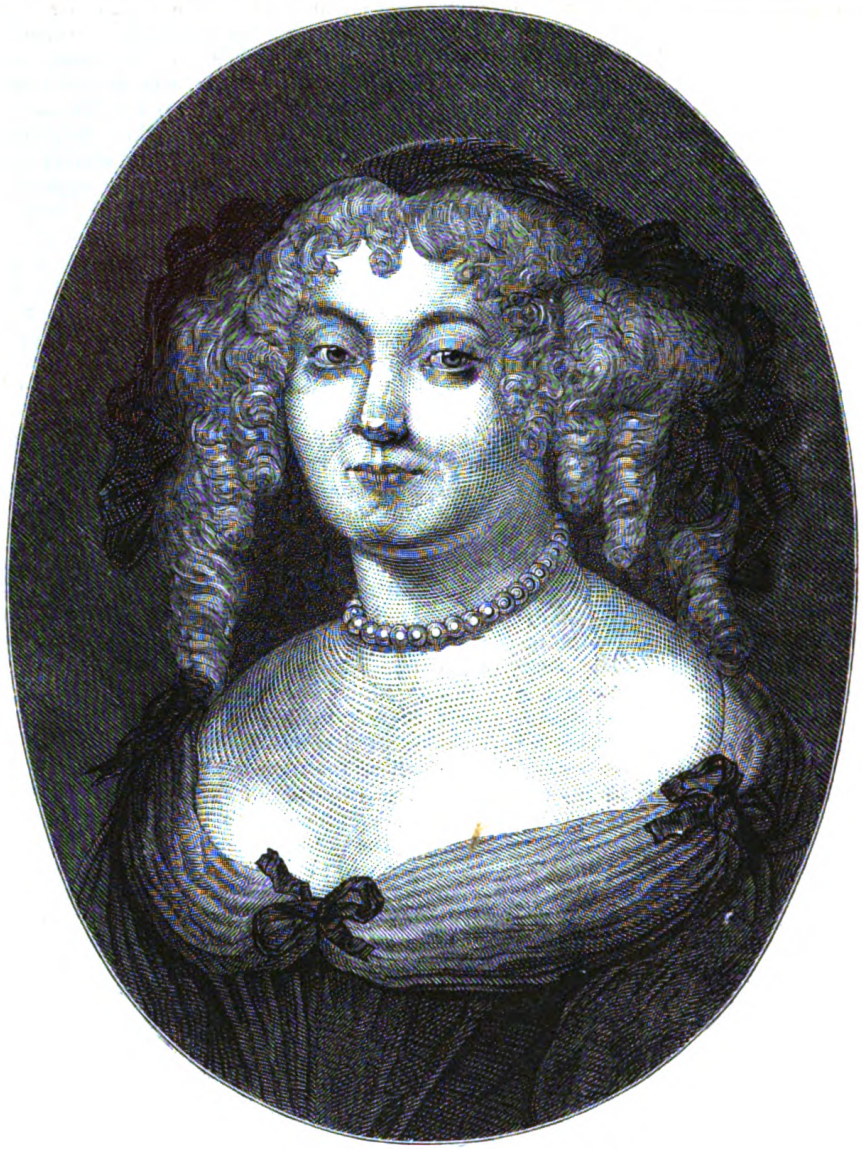
ous cousin Bussy; the tender and passionate Comte du Lude, discreet and dangerous, whose tearful implorations made him "formidable to the peace and reputation" of the fair; the Comte de Vassé, the Comte de Montmoron, and the Marquis de Noirmoutier, assiduous admirers; her old teacher Ménage; the pleasant, humpbacked Abbé St. Pavin, whose pen found its best inspiration in the charms and society of his neighbor's niece; the pedantic Chevalier de Méré, eminently befooled by the *Précieuses* and tolerated by madame; the jovial and indolent Abbé de Montreuil, a most delicate concocter of compliments. Seeing his hostess play blindman's-buff, he improvised a quatrain, saying, that with her eyes bandaged they took her for Love, and with eyes uncovered for his mother. There was also Marigny, prompt with song and repartee; and Segrais, a man of the world, who openly professed more than friendship for the Burgundian siren, but who acknowledged his hopelessness. Her freedom of manner and indiscretion of speech added dangerous piquancy to her other charms. Her want of circumspection in language in contrast to her purity of action has naturally attracted comment. But some idea of the manners and speech of that day may be found in the fact that for checking expressions in the first society which would now be intolerable in any decent circle Madame De Rambouillet acquired a reputation for most exaggerated fastidiousness.

The wit, beauty, and manners of the youthful marquise were a sufficient temptation to the love-making abbés and courtier blacklegs of the day, without having a reprobate husband whose neglect left her a prey to subtle and audacious consolers. Alas! too soon did M. De Sévigné prove faithless, and as fickle as faithless, loving on all sides, and ruining his young wife with the extravagance of his expenditures on worthless women. Her grief was great, but also was her heart and her devotion. She smothered her sorrows in efforts to reclaim him. She persistently loved him; and though she could not be blind to his infidelities, wished to be so in the belief that *her* devotion would re-create his. In this hope she induced him to quit Paris and go to Les Rochers, where, early in 1648, their son was born.



The breaking out of the war of the Fronde later in this year took them from their Breton château, and again they are in Paris, and again the poor wife suffers from the neglect of a faithless husband. In 1650 Bussy, ever on the watch to weaken his cousin's faith and advance his own infamous designs, informed Madame De Sévigné that her husband was the favored lover of the wonderful Ninon de l'Enclos, then thirty-four years old, in the meridian of her brilliant beauty and destructive witchery. This disclosure almost mastered her patience, and unable to conceal her grief, she intimated the sad knowledge to her husband. He soon conjectured the source of information, and next day upbraided Bussy, who actually was the confidant of his passion for Ninon. Bussy boldly denied having broken faith, and assured him that madame had simply guessed the state of affairs. Having appeased the husband, he wrote to the wife, sneering at her want of prudence, and advising her that jealousy was more efficient to retain a heart than beauty. "I advise you," he writes, "to make your husband jealous, my fair cousin, and for this purpose I offer myself to you."

Madame was not awake when the letter arrived, and it fell into the hands of Monsieur De Sévigné, who read it, and dismissed the bearer with, "No answer." Bussy was in a frenzy at the *dénouement* of this little comedy, and was inclined to kill the page who had rendered his wiles and his plans abortive. He was forbidden the house, and got married soon after, which did not prevent him, however, resuming correspondence with his cousin in his usual style of gallant familiarity.

Ninon was as fickle as her new and envied lover. "Three months were for her three centuries," and soon Rambouillet de la Sablière took the place of Henri de Sévigné. The counsels of the abbé uncle now prevailed; madame's fortune was placed out of the power of her husband, greatly against her will; and he, taking her to Les Rochers, hurried back to Paris and a fresh intrigue. His new passion was a Madame De Gondran, the gay wife of a wealthy *bourgeois*, who became extravagantly infatuated by the attention of "les gens de la cour," and achieved complete empire over the weak disposition of De Sévigné. He kept himself and her other lovers in a fever of excitement, and by a series of dramatic complications was brought into a duel with the Chevalier d'Albret, to whom Madame De Gondran had denied herself four times. They fought on the 4th of February, 1651, and De Sévigné received a fatal wound. The news brought the devoted wife to Paris, but too late to see her husband alive. He died two days after the affray, at the age of thirty-two, just as his wife completed her twenty-fifth year.

The grief of Madame De Sévigné was poignant and sincere, for she loved him who had confessed that "for others she might be the most agreeable woman in the world, but that he could not love her." She passed nine months of regret at The Rochers, during which "she embraced the holy vocation of perpetual widowhood and devoted maternity." Her return to Paris at the close of 1651 was chronicled by Loret, who versified the events of society, as the coming of a chaste turtle-dove who had been mourning her mate in the country. Her youth,

MARQUISE DE SÉVIGNÉ.—A LATER PORTRAIT.

happy disposition, and keen sense of enjoyment seemed now more than ever calculated to surround her with peril. If she had been admired and wooed before, the new position of the "veuve jeune et belle" added greatly to the interest she excited; and at no period did there exist the snares and temptations arising from an intense love of light pleasures and dissipation as at that when she resumed her place in the gay circles of the capital. Mademoiselle, the cousin of the king, occupied the Tuileries, and gave brilliant entertainments, at which the witty widow often shone. She was on intimate terms with the Duchesse de Longueville, the Duchesse de Chevreuse, and the Duchesse de Châtillon, a daughter of her father's friend who had the duel on Easter-Sunday. Her aunts—Sévigné and Coulanges—gathered choice company at their houses; Madame Du Plessis-Guénégaud, of great wealth and intelligence, who instigated Foucquet to help authors and artists, was the "charming Amalthée" of an "enchanted palace"—the Hôtel de Nevers—where poets and their admirers congregated; and she visited also Sappho Scudéry, whose *ruelle* was, though on a lesser scale than that of Madame De Rambouillet, the resort of wits and flirts of both sexes.

In the summer following the Duc de Rohan, that noted Chabot whose good looks and grace as a dancer won the proudest heiress in France, and a leading title also, had a great feud with the Marquis de Tonquedec, growing from rivalry to be distin-

guished by Madame De Sévigné. This was the cause of much notoriety, which she could but shun and could not control, as well as many painful emotions which her principles could not repress. She sought solace in the solitude of The Rochers, and in the care of her children, whose happiness was the passion of her existence. In Paris, in the winter of 1653–54, she is more than ever surrounded and courted, by the brave, the great, the magnificent, even by the blood royal: but by a tact which seemed an inspiration she preserved her truth without humiliating her adorers. The Comte du Lude was still her faithful and discreet admirer. The Prince de Conti, brother of Condé, although recently married to a good and lovable woman, was attracted by the charms of the turtle-dove of Les Rochers, and was ceaseless in attempts to win her notice. "It is necessary," says the Comtesse de Puliga, justly, "to read the memoirs of the seventeenth century to comprehend and value the prestige of princes of the blood, and to understand how leniently the world looked upon their weaknesses." Had Madame De Sévigné listened to so exalted a lover, "she would have reaped more outward consideration than condemnation." Even Bussy gave way for the prince, and in his rascal way sought to instigate his cousin to ruin. Writing to her, he says: "Fortune is making you great advances, my dear cousin; be not ungrateful. You are as much attached to virtue as if it were something solid, and you despise wealth as if you could never need it." But if the personal ambition of Bussy would make him a pander to the prince, it was otherwise with Foucquet, the Surintendant des Finances, whose boundless control of wealth often helped him to triumph. He failed with Madame De Sévigné, yet retained her friendship, and even in his adversity held her affectionate sympathy. An envious attempt was made to involve her good name at the time of his arrest; but her letters, found in his chest, were solely of family matters, and the king himself declared they were "such as to do her honor." Foucquet appropriated the finances, and presented Louis XIV. with fictitious accounts, which were daily contradicted by Colbert, then "wending his way." In the midst of his magnificence and power Foucquet was overwhelmed, and ended his days, almost forgotten, after fourteen years' close imprisonment, in Pignerol. Madame De Sévigné's letters give a vivid narrative of his fall and trial. Turenne, the great captain, also found in Madame De Sévigné a citadel his art could not capture. She had to deny herself to him to guard her reputation, yet on his death—twenty years after, to be sure—remembers only his glory as "the greatest captain and the most honorable man in the world."

In the winter of 1662–63 an event always of interest to a mother took place. Her daughter appeared at court, and the sensation made by her beauty and accomplishments delighted the mother, by whom she was so beloved. Although the daughter lacked the warmth and geniality which rendered the mother so fascinating, and placed a value on her own charms which amounted to self-worship, she won "all the favors which the court could bestow and the world envy." She took part in the splendid ballets projected or invented by Louis XIV., and in which he appeared himself, surrounded by dukes and marquises and the flower of the girlhood and womanhood of the time. She became the theme of poets and the admiration of gallants, but her reputation was saved by the coldness of her manner. At one time the attention of the king "seemed likely to ripen into more tender sentiments," but this "excess of honor, or indignity," fell to the share of Madame De Montespan. At last, after some years of motherly anxiety to have her daughter—who was approaching the advanced age of twenty-three—settled, Madame De Sévigné had the satisfaction of seeing Mademoiselle Françoise married, in 1669, to the Comte de Grignan, of a good family, who had been already twice married, and held the office of lieutenant-general of the king in Languedoc. About the period of this alliance her son, Charles de Sévigné, then over twenty, and impatient for distinction, joined an expedition to aid Venice against the Turks, and won a character for valor which he was destined to sustain. He had the family strength for gallantry, at least at one portion of his life the paternal weakness for dissipation, and actually fell into the snares of the same Ninon de l'Enclos, still lovely and attractive at fifty-four, who had helped to ruin his father a quarter of a century previous.

As life progressed Madame De Sévigné continued to enjoy the society and friendship of the most eminent men of her time. There is scarcely a name of that wonderful period—famous in letters, state-craft, the field, the pulpit, or the stage—of which there are not reminiscences in her charming letters. The writers who lead French tragedy and comedy, Corneille, Racine, Molière; the preachers who have never been surpassed in French pulpits, Bossuet, Bourdaloue, Massillon, Fléchier; the poets, satirists, moralists, fabulists, and essayists—the Boileaus, La Rochefoucaulds, Pascals, La Fontaines, with numbers of others then scarcely less, some even better known, but now of not so much interest—live, read, sparkle, or moralize in her remarkable pages. From the saint to the sinner, from the noble-souled Abbé de Coulanges to the depraved Bussy, from Sainte Chantal, who left her father, to the sinner Ninon, who captured her hus-

band, her son, and even her grandson, the correspondence of Madame De Sévigné presents every variety of humanity, aiding to make or unmake opinion, or illustrating society in the memorable reign of Louis Quatorze.

Passing her time in country or city, Madame De Sévigné kept up that correspondence with her daughter upon which mainly her great reputation as a writer depends. Every thing of interest to her she deems of interest to her child, from whom absence was a pang never ameliorated, and which was occupied by communicating with her. This intense, ever-solicitous, and never-varying devotion of the mother does not seem to have been highly or even adequately appreciated by the daughter. This ever-restless, overanxious maternal solicitude of Madame De Sévigné, which never left her, is in strong contrast to the calm spirit of her grandmother, who could and did leave her children and the world at the same time. Her death was in keeping with that maternal spirit of sacrifice she was always only too desirous of making. The daughter's illness at Grignan brought the devoted mother to her bedside. Her excessive sympathy with the invalid made her declare she was dying of the illness of her daughter. Her feelings were a premonition of fate. At the beginning of April, 1696, the small-pox seized her, and on the 17th she closed her life—with no relative's voice, no relative's palm, to soothe or soften the departure. "The woman who had lived entirely for her children was childless in that last supreme moment."

And thus passed away a woman of exceeding ability and force of character; one who, no doubt not deeming herself among the literary lights of her time, is yet held by Lamartine to be the Petrarch of French prose. Her letters were not given to the world for thirty years after she had left it, yet it is indubitable testimony to their style, merits, and historical usefulness that they are still held unrivaled as pictures, less purely brilliant than vividly drawn, of men, manners, and society in the seventeenth century. Lamartine makes her in some respects one of the representative women of the world in putting her among his "Celebrated Characters;" and her latest biographer, the Comtesse de Puliga, from whose interesting work we have chiefly drawn the facts of this article, illustrates her career with loving and industrious discrimination. If Lamartine's treatment of Madame De Sévigné is in a romantic mood of appreciation, the facts in Comtesse de Puliga's work justify it. In reading the letters which made Walpole worship her, we are led to think with Mackintosh that she has probably become an immortal writer without expecting it. As a wife, mother, and woman she has as many claims for love on her own sex as her wit and letters command from the opposite.

Orphaned at seventeen months, but seven years old when her mother died, little more than eight when the death of her maternal grandmother left her without the guardianship of any womanly solicitude, wed at eighteen, and a widow at twenty-five, there seems, indeed, little time for the gathering or utilizing of the forces which were to carry her and her alluring beauty and dangerous free wit through such a continuous path of peril. Yet we see her strong, noble, and virtuous, while gay and even indiscreet. She was mirthful without immodesty, and modest without prudery; pure in the midst of impurity, virtuous in an atmosphere of vice. Wed before she was a woman, she remained a girl all her life—full of joyous purity, which is the strongest kind of commonsense, and acting with a fearless freedom, which those whom it defied called insensibility. She loved De Sévigné as a good wife could love a good husband, and diverted the wicked designs of other men like a good woman. While a devotee of her reckless husband, his neglect never brought her to the level of her devotees. She was true to herself as well as to him, and in being the one as the other had need of great tact and courage. Really in those days it was necessary for a beautiful good woman to be a clever diplomate to protect herself from, without seriously offending, the coxcombs and intriguers whose delinquencies could not call forth dismissal. To positively shun them would be to make a parade of virtue no one would appreciate, and which the majority would condemn as hollow prudery. Humiliated cavaliers could be calumniators, as Bussy once threatened his cousin, and were as dangerous as successful gallants.

While a woman of society, Madame De Sévigné loved the country. From the days of her pupilage at Livry to her last journey she never failed to take comfort from the air, the quiet, the scenery, the sensations of country life. Les Rochers are eternally twined with her name and fame, as with the epochs when she sought peace of mind or wept in solitude. There is something that fills up the demands of nature in the fact that while the beloved of fashion, she loved the fields. Shining in the court, she sought domestic life in the country. Apparently made alone to shine amidst the blaze of wit, she realized equal enjoyment in the sombre woods, and was a contented worshiper of nature in its wildest and sometimes least inviting forms. This dualism of feeling or appreciation was exemplified in her manner, which had the freedom of the woods and the *finesse* of the city; and both were indispensable to preserve her sway and protect herself as a queen among women and a woman among queens.

A SIMPLETON.

A STORY OF THE DAY.

By CHARLES READE.

CHAPTER XXII.

WHEN Falcon went, luck seemed to desert their claim: day after day went by without a find; and the discoveries on every side made this the more mortifying.

By this time the diggers at Bulteel's pan were as miscellaneous as the audience at Drury Lane Theatre, only mixed more closely; the gallery folk and the stalls worked cheek by jowl. Here a gentleman with an affected lisp, and close by an honest fellow who could not deliver a sentence without an oath, or some still more horrible expletive that meant nothing at all in reality, but served to make respectable flesh creep; interspersed with these, Hottentots, Kafirs, and wild blue-blacks gayly clad in an ostrich feather, a scarlet ribbon, and a Tower musket, sold them by some good Christian for a modern rifle.

On one side of Staines were two swells, who lay on their backs and talked opera half the day; but seldom condescended to work without finding a diamond of some sort.

After a week's deplorable luck his Kafir boy struck work on account of a sore in his leg; the sore was due to a very common cause—the burning sand had got into a scratch, and festered. Staines, out of humanity, examined the sore; and proceeding to clean it, before bandaging, out popped a diamond worth forty pounds, even in the depreciated market. Staines quietly pocketed it, and bandaged the leg. This made him suspect his blacks had been cheating him on a large scale, and he borrowed Hans Bulteel to watch them, giving him a third, with which Master Hans was mightily pleased. But they could only find small diamonds, and by this time prodigious slices of luck were reported on every side. Kafirs and Boers, that would not dig, but traversed large tracts of ground when the sun was shining, stumbled over diamonds. One Boer pointed to a wagon and eight oxen, and said that one lucky glance on the sand had given him that lot; but day after day Staines returned home, covered with dust and almost blinded, yet with little or nothing to show for it.

One evening, complaining of his change of luck, Bulteel quietly proposed to him migration. "I am going," said he, resignedly; "and you can come with me."

"You leave your farm, Sir? Why, they pay you ten shillings a claim, and that must make a large return: the pan is fifteen acres."

"Yes, mine vriend," said the poor Hollander, "dey pay; but deir money it cost too dear. Vere is mine peace? Dis farm is six tousand acres. If de cursed diamonds was farther off, den it vas vell. Bud dey are too near. Once I could smoke in peace, and zleep. Now diamonds is come, and zleep and peace is fled. Dere is four tousand tents, and to each tent a dawg; dat dawg bark at four tousand oder dawgs all night, and dey bark at him and at each oder. Den de masters of de dawgs dey get angry, and fire four tousand pistole at de four tousand dawgs, and make my bed shake wid de trembling of mine vrow. My vamily is wid diamonds infected. Dey vill not vork. Dey takes long valks, and always looks on de ground. Mine childre shall be humpbacked, roundshouldered, looking down for diamonds. Dey shall forget Gott. He is on high: deir eyes are always on de earth. De diggers found a diamond in mine plaster of mine wall of mine house. Dat plaster vas limestone; it come from dose kopjes de good Gott made in His anger against man for his vickedness. I zay so. Dey not believe me. Dey tink dem abominable stones grow in mine house and break out in mine plaster like de measle: dey vaunt to dig in mine wall, in mine garden, in mine floor. One day dey shall dig in mine body. I vill go. Better I love peace dan money. Here is English company make me offer for mine varm. Dey forgive de diamonds."

"You have not accepted it?" cried Staines, in alarm.

"No, but I vill. I have said I shall tink of it. Dat is my vay. So I say yah."

"An English company? They will cheat you without mercy. No, they shall not, though, for I will have a hand in the bargain."

He set to work directly, added up the value of the claims, at ten shillings per month, and amazed the poor Hollander by his statement of the value of those fifteen acres, capitalized.

And, to close this part of the subject, the obnoxious diamonds obtained him three times as much money as his father had paid for the whole six thousand acres.

The company got a great bargain, but Bulteel received what for him was a large capital, and settling far to the south, this lineal descendant of "le philosophe sans le savoir" carried his godliness, his cleanliness, and his love of peace out of the turmoil, and was happier than ever, since now he could compare his placid existence with one year of noise and clamor.

But long before this, events more pertinent to my story had occurred.

One day a Hottentot came into Bulteel's farm, and went about among the diggers till he found Staines. The Hottentot was one employed at Dale's Kloof, and knew him. He brought Staines a letter.

Staines opened the letter, and another letter fell out; it was directed to "Reginald Falcon, Esq."

"Why," thought Staines, "what a time this letter must have been on the road! So much for private messengers."

The letter ran thus:

"DEAR SIR,—This leaves us all well at Dale's Kloof, as I hope it shall find you and my dear husband at the diggings. Sir, I am happy to say I have good news for you. When you got well, by God's mercy, I wrote to the doctor at the hospital, and told him so. I wrote unbeknown to you, because I had promised him. Well, Sir, he has written back to say you have two hundred pounds in money, and a great many valuable things, such as gold and jewels. They are all at the old bank in Cape Town, and the cashier has seen you, and will deliver them on demand. So that is the first of my good news, because it is good news to you. But, dear Sir, I think you will be pleased to hear that Dick and I are thriving wonderfully, thanks to your good advice. The wooden house it is built, and a great oven. But, Sir, the traffic came almost before we were ready, and the miners that call here, coming and going, every day, you would not believe, likewise wagons and carts. It is all bustle, morn till night, and dear Reginald will never be dull here now. I hope you will be so kind as tell him so, for I do long to see you both home again.

"Sir, we are making our fortunes. The grain we could not sell at a fair price we sell as bread, and higher than in England ever so much. Tea and coffee the same, and the poor things praise us, too, for being so moderate. So, Sir, Dick bids me say that we owe this to you, and if so be you are minded to share, why, nothing would please us better. Head-piece is always worth money in these parts; and if it hurts your pride to be our partner without money, why, you can throw in what you have at the Cape, though we don't ask that. And, besides, we are offered diamonds a bargain every day, but are afraid to deal, for want of experience; but if you were in it with us, you must know them well by this time, and we might turn many a good pound that way. Dear Sir, I hope you will not be offended, but I think this is the only way we have, Dick and I, to show our respect and goodwill.

"Dear Sir, digging is hard work, and not fit for you and Reginald, that are gentlemen, among a lot of rough fellows, that their talk makes my hair stand on end, though I dare say they mean no harm.

"Your bedroom is always ready, Sir. I never will let it to any of them, hoping now to see you every day. You that know every thing, can guess how I long to see you both home. My very good fortune seems not to taste like good fortune, without those I love and esteem to share it. I shall count how many days this letter will take to reach you, and then I shall pray for your safety harder than ever till the blessed hour comes when I see my husband and my good friend, never to part again, I hope, in this world.

"I am, Sir, your dutiful servant and friend, PHŒBE DALE."

"P.S.—There is regular traveling to and from Cape Town, and a Post now to Pniel, but I thought it surest to send by one that knows you."

Staines read this letter with great satisfaction. He remembered his two hundred pounds, but his gold and jewels puzzled him. Still it was good news, and pleased him not a little. Phœbe's good fortune gratified him too, and her offer of a partnership, especially in the purchase of diamonds from returning diggers. He saw a large fortune to be made; and, wearied and disgusted with recent ill luck, blear-eyed and almost blinded with sorting in the blazing sun, he resolved to go at once to Dale's Kloof. Should Mrs. Falcon be gone to England with the diamonds, he would stay there, and Rosa should come out to him, or he would go and fetch her.

He went home and washed himself, and told Bulteel he had had good news, and should leave the diggings at once. He gave him up the claim, and told him to sell it by auction. It was worth two hundred pounds still. The good people sympathized with him, and he started within an hour. He left his pickaxe and shovel, and took only his double rifle—an admirable one—some ammunition, including conical bullets and projectile shells given him by Falcon, a bag full of carbuncles and garnets he had collected for Ucatella, a few small diamonds, and one hundred pounds—all that remained to him, since he had been paying wages and other things for months, and had given Falcon twenty for his journey.

He rode away, and soon put twenty miles between him and the diggings.

He came to a little store that bought diamonds and sold groceries and tobacco. He haltered his horse to a hook, and went in. He offered a small diamond for sale. The master was out, and the assistant said there was a glut of these small stones; he did not care to give money for it.

"Well, give me three dozen cigars."

While they were chaffering, in walked a

Hottentot, and said, "Will you buy this?" and laid a clear, glittering stone on the counter, as large as a walnut.

"Yes," said the young man. "How much?"

"Two hundred pounds."

"Two hundred pounds! Let us look at it." He examined it, and said he thought it was a diamond, but these large stones were so deceitful he dared not give two hundred pounds. "Come again in an hour," said he, "then the master will be in."

"No," said the Hottentot, quietly, and walked out.

Staines, who had been literally perspiring at the sight of this stone, mounted his horse and followed the man. When he came up to him he asked leave to examine the gem. The Hottentot quietly assented.

Staines looked at it all over. It had a rough side and a polished side, and the latter was of amazing softness and lustre. It made him tremble. He said, "Look here, I have only one hundred pounds in my pocket."

The Hottentot shook his head.

"But if you will go back with me to Bulteel's farm, I'll borrow the other hundred."

The Hottentot declined, and told him he could get four hundred pounds for it by going back to Pniel. "But," said he, "my face is turned so, and when Squat turn his face so, he going home. Not can bear go the other way then;" and he held out his hand for the diamond.

Staines gave it him, and was in despair at seeing such a prize so near, yet leaving him.

He made another effort. "Well, but," said he, "how far are you going this way?"

"Ten days."

"Why, so am I. Come with me to Dale's Kloof and I will give the other hundred. See, I am in earnest, for here is one hundred, at all events."

Staines made this proposal, trembling with excitement. To his surprise and joy the Hottentot assented, though with an air of indifference, and on these terms they became fellow-travelers, and Staines gave him a cigar. They went on side by side, and halted for the night forty miles from Bulteel's farm.

They slept in a Boer's outhouse, and the vrow was civil, and lent Staines a jackal's skin. In the morning he bought it for a diamond, a carbuncle, and a score of garnets; for a horrible thought had occurred to him—if they stopped at any place where miners were, somebody might buy the great diamond over his head. This fear, and others, grew on him, and, with all his philosophy, he went on thorns, and was the slave of the diamond.

He resolved to keep his Hottentot all to himself if possible. He shot a springbok that crossed the road, and they roasted a portion of the animal, and the Hottentot carried some on with him.

Seeing he admired the rifle, Staines offered it him for the odd hundred pounds, but, though Squat's eye glittered a moment, he declined.

Finding that they met too many diggers and carts, Staines asked his Hottentot was there no nearer way to reach that star, pointing to one he knew was just over Dale's Kloof.

Oh yes, he knew a nearer way, where there were trees and shade and grass, and many beasts to shoot.

"Let us take that way," said Staines.

The Hottentot, ductile as wax, except about the price of the diamond, assented calmly; and next day they diverged, and got into forest scenery, and their eyes were soothed with green glades here and there, wherever the clumps of trees sheltered the grass from the panting sun. Animals abounded, and were tame; Staines, an excellent marksman, shot the Hottentot his supper without any trouble.

Sleeping in the wood, with not a creature near but Squat, a sombre thought struck Staines. Suppose this Hottentot should assassinate him for his money, who would ever know? The thought was horrible, and he awoke with a start ten times that night. The Hottentot slept like a stone, and never feared for his own life and precious booty; Staines was compelled to own to himself he had less faith in human goodness than the savage had. He said to himself, "He is my superior. He is the master of this dreadful diamond, and I am its slave."

Next day they went on till noon, and then they halted at a really delightful spot; a silver kloof ran along a bottom, and there was a little clump of three acacia-trees that lowered their long tresses, pining for the stream, and sometimes getting a cool, grateful kiss from it when the water was high.

They haltered the horse, bathed in the stream, and lay luxurious under the acacias. All was delicious languor and enjoyment of life.

The Hottentot made a fire, and burned the remains of a little sort of kangaroo Staines had shot him the evening before; but it did not suffice his maw, and looking about him, he saw three elands leisurely feeding about three hundred yards off. They were cropping the rich herbage close to the shelter of a wood.

The Hottentot suggested that this was an excellent opportunity. He would borrow Staines's rifle, steal into the wood, crawl on his belly close up to them, and send a bullet through one.

Staines did not relish the proposal. He had seen the savage's eye repeatedly gloat on the rifle, and was not without hopes he might even yet relent, and give the great

diamond for the hundred pounds and this rifle; and he was so demoralized by the diamond, and filled with suspicions, that he feared the savage, if he once had the rifle in his possession, might cut, and be seen no more, in which case he, Staines, still the slave of the diamond, might hang himself on the nearest tree, and so secure his Rosa the insurance money, at all events. In short, he had really diamond on the brain.

He hem'd and haw'd a little at Squat's proposal, and then got out of it by saying, "That is not necessary. I can shoot it from here."

"It is too far," objected Blacky.

"Too far! This is an Enfield rifle. I could kill the poor beast at three times that distance."

Blacky was amazed. "An Enfeel rifle," said he, in the soft musical murmur of his tribe, which is the one charm of the poor Hottentot; "and shoot three times *so* far."

"Yes," said Christopher. Then, seeing his companion's hesitation, he conceived a hope. "If I kill that eland from here, will you give me the diamond for my horse and the wonderful rifle—no Hottentot has such a rifle."

Squat became cold directly. "The price of the diamond is two hundred pounds."

Staines groaned with disappointment, and thought to himself, with rage, "Any body but me would club the rifle, give the obstinate black brute a stunner, and take the diamond—God forgive me!"

Says the Hottentot, cunningly, "I can't think so far as white man. Let me see the eland dead, and then I shall know how far the rifle shoot."

"Very well," said Staines. But he felt sure the savage only wanted his meal, and would never part with the diamond except for the odd money.

However, he loaded his left barrel with one of the explosive projectiles Falcon had given him; it was a little fulminating shell with a steel point. It was with this barrel he had shot the murcat overnight, and he had found he shot better with this barrel than the other. He loaded his right barrel then, saw the powder well up, capped it, and cut away a strip of the acacia with his knife to see clear, and lying down in volunteer fashion, elbow on ground, drew his bead steadily on an eland that presented him her broadside, her back being turned to the wood. The sun shone on her soft coat, and never was a fairer mark, the sportsman's deadly eye being in the cool shade, the animal in the sun.

He aimed long and steadily. But, just as he was about to pull the trigger, Mind interposed, and he lowered the deadly weapon. "Poor creature!" he said, "I am going to take her life—for what? for a single meal. She is as big as a pony; and I am to lay her carcass on the plain, that we may eat two pounds of it. This is how the weasel kills the rabbit; sucks an ounce of blood for his food, and wastes the rest. So the demoralized sheep-dog tears out the poor creature's kidneys, and wastes the rest. Man, armed by science with such powers of slaying, should be less egotistical than weasels and perverted sheep-dogs. I will not kill her. I will not lay that beautiful body of hers low, and glaze those tender, loving eyes that never gleamed with hate or rage at man, and fix those innocent jaws that never bit the life out of any thing, not even of the grass she feeds on, and does it more good than harm. Feed on, poor innocent. And you be blanked; you and your diamond, that I begin to wish I had never seen; for it would corrupt an angel."

Squat understood one word in ten, but he managed to reply. "This is nonsense-talk," said he, gravely. "The life is no bigger in that than in the murcat you shot last shoot."

"No more it is," said Staines. "I am a fool. It is come to this, then: Kafirs teach us theology, and Hottentots morality. I bow to my intellectual superior. I'll shoot the eland." He raised his rifle again.

"No, no, no, no, no, no," murmured the Hottentot, in a sweet voice scarcely audible, yet so keen in its entreaty that Staines turned hastily round to look at him. His face was ashy, his teeth chattering, his limbs shaking. Before Staines could ask him what was the matter he pointed through an aperture of the acacias into the wood hard by the elands. Staines looked, and saw what seemed to him a very long dog, or some such animal, crawling from tree to tree. He did not at all share the terror of his companion, nor understand it. But a terrible explanation followed. This creature, having got to the skirt of the wood, expanded, by some strange magic, to an incredible size, and sprang into the open with a growl, a mighty lion: he seemed to ricochet from the ground, so immense was his second bound, that carried him to the eland, and he struck her one blow on the head with his terrible paw, and felled her as if with a thunder-bolt. Down went her body, with all the legs doubled, and her poor head turned over, and the nose kissed the ground. The lion stood motionless. Presently the eland, who was not dead, but stunned, began to recover and struggle feebly up. Then the lion sprang on her with a roar, and rolled her over, and, with two tremendous bites and a shake, tore her entrails out and laid her dying. He sat composedly down, and contemplated her last convulsions without touching her again.

At his roar, though not loud, the horse, though he had never heard or seen a lion, trembled and pulled at his halter.

Blacky crept into the water, and Staines was struck with such an awe as he had never felt. Nevertheless, the king of beasts be-

ing at a distance and occupied, and Staines a brave man and out of sight, he kept his ground and watched, and by those means saw a sight never to be forgotten. The lion rose up, and stood in the sun, incredibly beautiful as well as terrible. His was not the mangy hue of the caged lion, but a skin tawny, golden, glossy as a race-horse, and of exquisite tint that shone like pure gold in the sun; his eye a lustrous jewel of richest hue, and his mane sublime. He looked toward the wood, and uttered a full roar. This was so tremendous that the horse shook all over as if in an ague, and began to lather. Staines recoiled, and his flesh crept, and the Hottentot went under water, and did not emerge for ever so long.

After a pause the lion roared again, and all the beasts and birds of prey seemed to know the meaning of that terrible roar. Till then the place had been a solitude, but now it began to fill in the strangest way, as if the lord of the forest could call all his subjects together with a trumpet roar: first came two lion cubs, to whom, in fact, the roar had been addressed. The lion rubbed himself several times against the eland, but did not eat a morsel, and the cubs went in and feasted on the prey. The lion politely and paternally drew back, and watched the young people enjoying themselves.

Meantime approached, on tiptoe, jackals and hyenas, but dared not come too near. Slate-colored vultures settled at a little distance, but not a soul dared interfere with the cubs; they saw the lion was acting sentinel, and they knew better than come near.

After a time, papa feared for the digestion of those brats, or else his own mouth watered; for he came up, knocked them head over heels with his velvet paw, and they took the gentle hint, and ran into the wood double quick.

Then the lion began tearing away at the eland, and bolting huge morsels greedily. This made the rabble's mouth water. The hyenas and jackals and vultures formed a circle ludicrous to behold, and that circle kept narrowing as the lion tore away at his prey. They increased in numbers, and at last hunger overcame prudence; the rear rank shoved on the front, as among men, and a general attack seemed imminent.

Then the lion looked up at these invaders, uttered a reproachful growl, and went at them, patting them right and left, and knocking them over. He never touched a vulture, nor, indeed, did he kill an animal. He was a lion, and only killed to eat; yet he soon cleared the place, because he knocked over a few hyenas and jackals, and the rest, being active, tumbled over the vultures before they could spread their heavy wings. After this warning they made a respectful circle again, through which, in due course, the gorged lion stalked into the wood.

A savage's sentiments change quickly, and the Hottentot, fearing little from a full lion, was now giggling at Staines's side. Staines asked him which he thought was the lord of all creatures, a man or a lion.

"A lion," said Blacky, amazed at such a shallow question.

Staines now got up, and proposed to continue their journey. But Blacky was for waiting till the lion was gone to sleep after his meal.

While they discussed the question the lion burst out of the wood within hearing of their voices, as his pricked-up ears showed, and made straight for them at a distance of scarcely thirty yards.

Now, the chances are, the lion knew nothing about them, and only came to drink at the kloof after his meal, and perhaps lie under the acacias: but who can think calmly, when his first lion bursts out on him a few paces off? Staines shouldered his rifle, took a hasty, flurried aim, and sent a bullet at him.

If he had missed him, perhaps the report might have turned the lion; but he wounded him, and not mortally. Instantly the enraged beast uttered a terrific roar, and came at him with his mane distended with rage, his eyes glaring, his mouth open, and his whole body dilated with fury.

At that terrible moment Staines recovered his wits enough to see that what little chance he had was to fire into the destroyer, not at him. He kneeled, and leveled at the centre of the lion's chest, and not till he was within five yards did he fire. Through the smoke he saw the lion in the air above him, and rolled shrieking into the stream, and crawled like a worm under the bank, by one motion, and there lay trembling.

A few seconds of sick stupor passed: all was silent. Had the lion lost him? Was it possible he might yet escape?

All was silent.

He listened, in agony, for the sniffing of the lion, puzzling him out by scent.

No: all was silent.

Staines looked round, and saw a woolly head and two saucer eyes and open nostrils close by him. It was the Hottentot, more dead than alive.

Staines whispered him, "I think he is gone."

The Hottentot whispered, "Gone a little way to watch. He is wise as well as strong." With this he disappeared beneath the water.

Still no sound but the screaming of the vultures, and snarling of the hyenas and jackals over the eland.

"Take a look," said Staines.

"Yes," said Squat; "but not to-day. Wait here a day or two. Den he forget and forgive."

Now Staines, having seen the lion lie

down and watch the dying eland, was a great deal impressed by this; and as he had now good hopes of saving his life, he would not throw away a chance. He kept his head just above water, and never moved.

In this freezing situation they remained.

Presently there was a rustling that made both crouch.

It was followed by a croaking noise.

Christopher made himself small.

The Hottentot, on the contrary, raised his head, and ventured a little way into the stream.

By these means he saw it was something very foul, but not terrible. It was a large vulture that had settled on the very top of the nearest acacia.

At this the Hottentot got bolder still, and, to the great surprise of Staines, began to crawl cautiously into some rushes, and through them up the bank.

The next moment he burst into a mixture of yelling and chirping and singing and other sounds so manifestly jubilant that the vulture flapped heavily away, and Staines emerged in turn, but very cautiously.

Could he believe his eyes? There lay the lion, dead as a stone, on his back, with his four legs in the air, like wooden legs, they were so very dead; and the valiant Squat dancing about him, and on him, and over him.

Staines, unable to change his sentiments so quickly, eyed even the dead body of the royal beast with awe and wonder. What, had he really laid that terrible monarch low, and with a tube made in a London shop by men who never saw a lion spring, nor heard his awful roar shake the air? He stood with his heart still beating, and said not a word. The shallow Hottentot whipped out a large knife and began to skin the king of beasts. Staines wondered he could so profane that masterpiece of nature. He felt more inclined to thank God for so great a preservation, and then pass reverently on and leave the dead king undesecrated.

He was roused from his solemn thoughts by the reflection that there might be a lioness about, since there were cubs. He took a piece of paper, emptied his remaining powder into it, and proceeded to dry it in the sun. This was soon done, and then he loaded both barrels.

By this time the adroit Hottentot had flayed the carcass sufficiently to reveal the mortal injury. The projectile had entered the chest, and, slanting upward, had burst among the vitals, reducing them to a gory pulp. The lion must have died in the air, when he bounded on receiving the fatal shot.

The Hottentot uttered a cry of admiration. "Not the lion king of all, nor even the white man," he said, "but Enfeel rifle!"

Staines's eyes glittered. "You shall have it and the horse for your diamond," said he, eagerly.

The black seemed a little shaken, but did not reply. He got out of it by going on with his lion; and Staines eyed him, and was bitterly disappointed at not getting the diamond even on these terms. He began to feel he should never get it. They were near the high-road; he could not keep the Hottentot to himself much longer. He felt sick at heart. He had wild and wicked thoughts; half hoped the lioness would come and kill the Hottentot, and liberate the jewel that possessed his soul.

At last the skin was off, and the Hottentot said, "Me take this to my kraal, and dey all say, 'Squat a great shooter; kill um lion.'"

Then Staines saw another chance for him, and summoned all his address for a last effort. "No, Squat," said he, "that skin belongs to me. I shot the lion, with the only rifle that can kill a lion like a cat. Yet you would not give me a diamond—a paltry stone for it. No, Squat, if you were to go into your village with that lion's skin, why, the old men would bend their heads to you, and say, 'Great is Squat! He killed the lion, and wears his skin.' The young women would all fight which should be the wife of Squat. Squat would be king of the village."

Squat's eyes began to roll.

"And shall I give the skin and the glory that is my due to an ill-natured fellow who refuses me his paltry diamond for a good horse—look at him; and for the rifle that kills lions like rabbits—behold it; and a hundred pounds in good gold and Dutch notes—see; and for the lion's skin and glory and honor and a rich wife, and to be king of Africa? Never."

The Hottentot's hands and toes began to work convulsively. "Good master, Squat ask pardon. Squat was blind. Squat will give the diamond, the great diamond of Africa, for the lion's skin, and the king rifle, and the little horse, and the gold, and Dutch notes every one of them. Dat make just two hundred pounds."

"More like four hundred," cried Staines, very loud. "And how do I know it is a diamond? These large stones are the most deceitful. Show it me this instant," said he, imperiously.

"Iss, master," said the crushed Hottentot, with the voice of a mouse, and put the stone into his hand with a child-like faith that almost melted Staines; but he saw he must be firm. "Where did you find it?" he bawled.

"Master," said poor Squat, in deprecating tones, "my little master at the farm wanted plaster. He send to Bulteel's pan; dere was large lumps. Squat say to miners, 'May we

take de large lumps?' Dey say, 'Yes; take de cursed lumps we no can break.' We took de cursed lumps. We ride 'em in de cart to farm, twenty milses. I beat 'em with my hammer. Dey is very hard. More dey break my heart dan I break deir cursed heads. One day I use strong words, like white man, and I hit one large lump too hard; he break, and out come de white clear stone. Iss, him diamond. Long time we know him in our kraal, because he hard. Long time before ever white man know him, tousand years ago, we find him, and he make us lilly hole in big stone for make wheat dust. Him a diamond, blank my eyes!"

This was intended as a solemn form of asseveration adapted to the white man's habits.

Yes, reader, he told the truth; and, strange to say, the miners knew the largest stones were in those great lumps of carbonate, but then the lumps were so cruelly hard, they lost all patience with them, and so, finding it was no use to break some of them and not all, they rejected them all, with curses; and thus this great stone was carted away as rubbish from the mine, and found, like a toad in a hole, by Squat.

"Well," said Christopher, "after all, you are an honest fellow, and I think I will buy it; but first you must show me out of this wood; I am not going to be eaten alive in it for want of the king of rifles."

Squat assented eagerly, and they started at once. They passed the skeleton of the eland; its very bones were polished, and its head carried into the wood; and looking back, they saw vultures busy on the lion. They soon cleared the wood.

Squat handed Staines the diamond—when it touched his hand as his own a bolt of ice seemed to run down his back, and hot water to follow it—and the money, horse, rifle, and skin were made over to Squat.

"Shake hands over it, Squat," said Staines; "you are hard, but you are honest."

"Iss, master, I a good much hard and honest," said Squat.

"Good-by, old fellow."

"Good-by, master."

And Squat strutted away, with the halter in his hand, horse following him, rifle under his arm, and the lion's skin over his shoulders, and the tail trailing, a figure sublime in his own eyes, ridiculous in creation's. So vanity triumphed even in the wilds of Africa.

Staines hurried forward on foot, loading his revolver as he went, for the very vicinity of the wood alarmed him now he had parted with his trusty rifle.

That night he lay down on the open veldt, in his jackal's skin, with no weapon but his revolver, and woke with a start a dozen times. Just before daybreak he scanned the stars carefully, and, noting exactly where the sun rose, made a rough guess at his course, and followed it till the sun was too hot; then he crept under a ragged bush, hung up his jackal's skin, and sweated there, parched with thirst, and gnawed with hunger. When it was cooler, he crept on, and found water, but no food. He was in torture, and began to be frightened, for he was in a desert. He found an ostrich egg, and ate it ravenously.

Next day hunger took a new form, faintness. He could not walk for it; his jackal's skin oppressed him; he lay down, exhausted. A horror seized his dejected soul. The diamond! It would be his death. No man must so long for any earthly thing as he had for this glittering traitor. "Oh, my good horse! my trusty rifle!" he cried. "For what have I thrown you away? For starvation. Misers have been found stretched over their gold; and some day my skeleton will be found, and nothing to tell the base death I died of, and deserved; nothing but the cursed diamond. Ay, fiend! glare in my eyes, do!" He felt delirium creeping over him; and, at that, a new terror froze him. His reason, that he had lost once, was he to lose it again? He prayed, he wept, he dozed, and forgot all. When he woke again a cool air was fanning his cheeks; it revived him a little; it became almost a breeze.

And this breeze, as it happened, carried on its wings the curse of Africa. There loomed in the northwest a cloud of singular density, that seemed to expand in size as it drew nearer, yet to be still more solid, and darken the air. It seemed a dust-storm. Staines took out his handkerchief, prepared to wrap his face in it, not to be stifled.

But soon there was a whirring and a whizzing, and hundreds of locusts flew over his head; they were followed by thousands, the swiftest of the mighty host. They thickened and thickened, till the air looked solid, and even that glaring sun was blackened by the rushing mass. Birds of all sorts whirled above, and swooped among them: they peppered Staines all over like shot. They stuck in his beard, and all over him; they clogged the bushes, carpeted the ground, while the darkened air sang as with the whirl of machinery. Every bird in the air, and beast of the field, granivorous or carnivorous, was gorged with them, and to these animals was added man, for Staines, being famished, and remembering the vrow Bulteel, lighted a fire, and roasted a handful or two on a flat stone; they were delicious. The fire once lighted, they cooked themselves, for they kept flying into it. Three hours, without interruption, did they darken nature, and before the column ceased all the beasts of the field came after, gorging them so recklessly that Staines could have shot an antelope dead with his pistol within a yard of him.

But, to tell the horrible truth, the cooked locusts were so nice that he preferred to gorge on them along with the other animals.

He roasted another lot for future use, and marched on with a good heart.

But now he got on some rough, scrubby ground, and damaged his shoes and tore his trowsers.

This lasted a terrible distance; but at the end of it came the usual arid ground; and at last he came upon the track of wheels and hoofs. He struck it at an acute angle, and that showed him he had made a good line. He limped along it a little way, slowly, being foot-sore.

By-and-by, looking back, he saw a lot of rough fellows swaggering along behind him. Then he was alarmed, terribly alarmed, for his diamond; he tore a strip off his handkerchief, and tied it cunningly under his armpit as he hobbled on.

The men came up with him.

"Hallo, mate! Come from the diggings?"

"Yes."

"What luck?"

"Very good."

"Haw! haw! What, found a fifty carat? Show it us."

"We found five big stones, my mate and me. He is gone to Cape Town to sell them. I had no luck when he left me, so I have cut it; going to turn farmer. Can you tell me how far it is to Dale's Kloof?"

No, they could not tell him that. They swung on; and, to Staines, their backs were a cordial, as we say in Scotland.

However, his travels were near an end. Next morning he saw Dale's Kloof in the distance; and, as soon as the heat moderated, he pushed on, with one shoe and tattered trowsers; and half an hour before sunset he hobbled up to the place.

It was all bustle. Travelers at the door; their wagons and carts under a long shed.

Ucatella was the first to see him coming, and came and fawned on him with delight. Her eyes glistened, her teeth gleamed. She patted both his cheeks, and then his shoulders, and even his knees, and then flew indoors crying, "My doctor child is come home!" This amused three travelers, and brought out Dick with a hearty welcome.

"But Lordsake, Sir, why have you come afoot; and a rough road too? Look at your shoes. Hallo! What is come of the horse?"

"I exchanged him for a diamond."

"The deuce you did! And the rifle?"

"Exchanged that for the same diamond."

"It ought to be a big un."

"It is."

Dick made a wry face. "Well, Sir, you know best. You are welcome, on horse or afoot. You are just in time; Phœbe and me are just sitting down to dinner."

He took him into a little room they had built for their own privacy, for they liked to be quiet now and then, being country bred; and Phœbe was putting their dinner on the table when Staines limped in.

She gave a joyful cry, and turned red all over. "Oh, doctor!" Then his travel-torn appearance struck her. "But, dear heart! what a figure! Where's Reginald? Oh, he's not far off, *I* know."

And she flung open the window, and almost flew through it in a moment, to look for her husband.

"Reginald?" said Staines. Then, turning to Dick Dale, "Why, he is here—isn't he?"

"No, Sir: not without he is just come with you."

"With me?—no. You know, we parted at the diggings. Come, Mr. Dale, he may not be here now; but he has been here. He must have been here."

Phœbe, who had not lost a word, turned round, with all her high color gone, and her cheeks getting paler and paler. "Oh, Dick! what is this?"

"I don't understand it," said Dick. "What ever made you think he was here, Sir?"

"Why, I tell you he left me to come here."

"Left you, Sir!" faltered Phœbe. "Why, when?—where?"

"At the diggings—ever so long ago."

"Blank him! that is just like him, the uneasy fool!" roared Dick.

"No, Mr. Dale, you should not say that: he left me, with my consent, to come to Mrs. Falcon here, and consult her about disposing of our diamonds."

"Diamonds!—diamonds!" cried Phœbe. "Oh, they make me tremble. How *could* you let him go alone? You didn't let *him* go on foot, I hope?"

"Oh no, Mrs. Falcon; he had his horse and his rifle, and money to spend on the road."

"How long ago did he leave you, Sir?"

"I—I am sorry to say it was five weeks ago."

"Five weeks! and not come yet. Ah! the wild beasts!—the diggers!—the murderers! He is dead!"

"God forbid!" faltered Staines; but his own blood began to run cold.

"He is dead. He has died between this and the dreadful diamonds. I shall never see my darling again: he is dead. He is dead."

She rushed out of the room, and out of the house, throwing her arms above her head in despair, and uttering those words of agony again and again in every variety of anguish.

At such horrible moments women always swoon—if we are to believe the dramatists. I doubt if there is one grain of truth in this. Women seldom swoon at all, unless their bodies are unhealthy, or weakened by the reaction that follows so terrible a shock as this. At all events, Phœbe, at first, was strong and wild as a lion, and went to and

fro outside the house, unconscious of her body's motion, frenzied with agony, and but one word on her lips, "He is dead!—he is dead!"

Dick followed her, crying like a child, but master of himself; he got his people about her, and half carried her in again; then shut the door in all their faces.

He got the poor creature to sit down, and she began to rock and moan, with her apron over her head, and her brown hair loose about her.

"Why should he be dead?" said Dick. "Don't give a man up like that, Phœbe. Doctor, tell us more about it. Oh, man, how could you let him out of your sight? You knew how fond the poor creature was of him."

"But that was it, Mr. Dale," said Staines. "I knew his wife must pine for him; and we had found six large diamonds, and a handful of small ones; but the market was glutted; and, to get a better price, he wanted to go straight to Cape Town. But I said, 'No; go and show them to your wife, and see whether she will go to Cape Town.'"

Phœbe began to listen, as was evident by her moaning more softly.

"Might he not have gone straight to Cape Town?" Staines hazarded this timidly.

"Why should he do that, Sir? Dale's Kloof is on the road."

"Only on one road. Mr. Dale, he was well armed, with rifle and revolver; and I cautioned him not to show a diamond on the road. Who would molest him? Diamonds don't show, like gold. Who was to know he had three thousand pounds hidden under his armpits and in two barrels of his revolver?"

"Three thousand pounds!" cried Dale. "You trusted *him* with three thousand pounds?"

"Certainly. They were worth about three thousand pounds in Cape Town, and half as much again in—"

Phœbe started up in a moment. "Thank God!" she cried. "There's hope for me. Oh, Dick, he is not dead: HE HAS ONLY DESERTED ME."

And with these strange and pitiable words, she fell to sobbing, as if her great heart would burst at last.

CHAPTER XXIII.

THERE came a reaction, and Phœbe was prostrated with grief and alarm. Her brother never doubted now that Reginald had run to Cape Town for a lark. But Phœbe, though she thought so too, could not be sure; and so the double agony of bereavement and desertion tortured her by turns and almost together. For the first time these many years she was so crushed she could not go about her business, but lay on a little sofa in her own room, and had the blinds down, for her head ached so she could not bear the light.

She conceived a bitter resentment against Staines, and told Dick never to let him into her sight, if he did not want to be her death.

In vain Dick made excuses for him: she would hear none. For once she was as unreasonable as any other living woman: she could see nothing but that she had been happy, after years of misery, and should be happy now if this man had never entered her house. "Ah, Colly!" she cried, "you were wiser than I was. You as good as told me he would make me smart for lodging and curing him. And I was *so* happy!"

Dale communicated this as delicately as he could to Staines. Christopher was deeply grieved and wounded. He thought it unjust, but he knew it was natural. He said, humbly, "I feel guilty myself, Mr. Dale; and yet, unless I had possessed omniscience, what could I do? I thought of her in all—poor thing! poor thing!"

The tears were in his eyes, and Dick Dale went away scratching his head and thinking it over. The more he thought, the less he was inclined to condemn him.

Staines himself was much troubled in mind, and lived on thorns. He wanted to be off to England, grudged every day, every hour, he spent in Africa. But Mrs. Falcon was his benefactress; he had been for months and months garnering up a heap of gratitude toward her. He had not the heart to leave her bad friends, and in misery. He kept hoping Falcon would return or write.

Two days after his return he was seated, disconsolate, gluing garnets and carbuncles on to a broad tapering bit of lamb-skin, when Ucatella came to him and said, "My doctor child sick?"

"No, not sick; but miserable." And he explained to her, as well as he could, what had passed. "But," said he, "I would not mind the loss of the diamonds now, if I was only sure he was alive. I think most of poor, poor Mrs. Falcon."

While Ucatella pondered this, but with one eye of demure curiosity on the coronet he was making, he told her it was for her—he had not forgot her at the mines. "These stones," said he, "are not valued there; but see how glorious they are!"

In a few minutes he had finished the coronet, and gave it her. She uttered a chuckle of delight, and, with instinctive art, bound it, in a turn of her hand, about her brow; and then Staines himself was struck dumb with amazement. The carbuncles gathered from those mines look like rubies, so full of fire are they, and of enormous size. The chaplet had twelve great carbuncles in the centre, and went off by gradations into smaller garnets by the thousand. They flashed their blood-red flames in the African sun, and the head of Ucatella, grand before, be-

came the head of the Sphinx, encircled with a coronet of fire. She bestowed a look of rapturous gratitude on Staines, and then glided away, like the stately Juno, to admire herself in the nearest glass, like any other coquette, black, brown, yellow, copper, or white.

That very day, toward sunset, she burst upon Staines quite suddenly, with her coronet gleaming on her magnificent head, and her eyes like coals of fire, and under her magnificent arm, hard as a rock, a boy kicking and struggling in vain. She was furiously excited, and, for the first time, showed signs of the savage in the whites of her eyes, which seemed to turn the glorious pupils into semicircles. She clutched Staines by the shoulder with her left hand, and swept along with the pair, like dark Fate, or as potent justice sweeps away a pair of culprits, and carried them to the little window, and cried, "Open! —open!"

Dick Dale was at dinner. Phœbe lying down. Dick got up, rather crossly, and threw open the window. "What is up now?" said he, crossly: he was like two or three more Englishmen—hated to be bothered at dinner-time.

"Dar," screamed Ucatella, setting down Tim, but holding him tight by the shoulder; "now you tell what you see that night, you lilly Kafir trash; if you not tell, I kill you DEAD;" and she showed the whites of her eyes, like a wild beast.

Tim, thoroughly alarmed, quivered out that he had seen lilly master ride up to the gate one bright night, and look in, and Tim thought he was going in; but he changed his mind, and galloped away that way; and the monkey pointed south.

"And why couldn't you tell us this before?" questioned Dick.

"Me mind de sheep," said Tim, apologetically. "Me not mind de lilly master: jackals not eat him."

"You no more sense dan a sheep yourself," said Ucatella, loftily.

"No, no: God bless you both," cried poor Phœbe: "now I know the worst;" and a great burst of tears relieved her suffering heart.

Dick went out softly. When he got outside the door, he drew them all apart, and said, "Yuke, you *are* a good-hearted girl. I'll never forget this while I live; and, Tim, there's a shilling for thee; but don't you go and spend it in Cape smoke; that is poison to whites, and destruction to blacks."

"No, master," said Tim. "I shall buy much bread, and make my tomach tiff;" then, with a glance of reproach at the domestic caterer, Ucatella, "I almost never have my tomach tiff."

Dick left his sister alone an hour or two, to have her cry out.

When he went back to her there was a change: the brave woman no longer lay prostrate. She went about her business; only she was always either crying or drowning her tears.

He brought Doctor Staines in. Phœbe instantly turned her back on him with a shudder there was no mistaking.

"I had better go," said Staines. "Mrs. Falcon will never forgive me."

"She will have to quarrel with me else," said Dick, steadily. "Sit you down, doctor. Honest folk like you and me and Phœbe wasn't made to quarrel for want of looking a thing all round. My sister, she hasn't looked it all round, and I have. Come, Pheeb, 'tis no use your blinding yourself. How was the poor doctor to know your husband is a blackguard?"

"He is not a blackguard. How dare you say that to my face?"

"He is a blackguard, and always was. And now he is a thief to boot. He has stolen those diamonds; you know that very well."

"Gently, Mr. Dale; you forget: they are as much his as mine."

"Well, and if half a sheep is mine, and I take the whole and sell him, and keep the money, what is that but stealing? Why, I wonder at you, Pheeb. You was always honest yourself, and yet you see the doctor robbed by your man, and that does not trouble you. What has he done to deserve it? He has been a good friend to us. He has put us on the road. We did little more than keep the pot boiling before he came—well, yes, we stored grain; but whose advice has turned that grain to gold, I might say? Well, what's his offense? He trusted the diamonds to your man, and sent him to you. Is he the first honest man that has trusted a rogue? How was he to know? Likely he judged the husband by the wife. Answer me one thing, Pheeb. If he makes away with fifteen hundred pounds that is his, or partly yours—for he has eaten your bread ever since I knew him—and fifteen hundred more that is the doctor's, where shall we find fifteen hundred pounds all in a moment to pay the doctor back his own?"

"My honest friend," said Staines, "you are tormenting yourself with shadows. I don't believe Mr. Falcon will wrong me of a shilling; and, if he does, I shall quietly repay myself out of the big diamond. Yes, my dear friends, I did not throw away your horse, nor your rifle, nor your money: I gave them all, and the lion's skin—I gave them all—for this."

And he laid the big diamond on the table.

It was as big as a walnut, and of the purest water.

Dick Dale glanced at it stupidly. Phœbe turned her back on it, with a cry of horror, and then came slowly round by degrees; and her eyes were fascinated by the royal gem.

"Yes," said Staines, sadly, "I had to

strip myself of all to buy it, and when I had got it, how proud I was, and how happy I thought we should all be over it; for it is half yours, half mine. Yes, Mr. Dale, there lies six thousand pounds that belong to Mrs. Falcon."

"Six thousand pounds!" cried Dick.

"I am sure of it. And so, if your suspicions are correct, and poor Falcon should yield to a sudden temptation, and spend all that money, I shall just coolly deduct it from your share of this wonderful stone: so make your mind easy. But no: if Falcon is really so wicked as to desert his happy home, and so mad as to spend thousands in a month or two, let us go and save him."

"That is my business," said Phœbe. "I am going in the mail-cart to-morrow."

"Well, you won't go alone," said Dick.

"Mrs. Falcon," said Staines, imploringly, "let me go with you."

"Thank you, Sir. My brother can take care of me."

"Me! You had better not take me. If I catch hold of him, by —— I'll break his neck, or his back, or his leg, or something: he'll never run away from you again, if I lay hands on him," replied Dick.

"I'll go alone. You are both against me."

"No, Mrs. Falcon. I am not," said Staines. "My heart bleeds for you."

"Don't you demean yourself, praying her," said Dick. "It's a public conveyance: you have no need to ask *her* leave."

"That is true: I can not hinder folk from going to Cape Town the same day," said Phœbe, sullenly.

"If I might presume to advise, I would take little Tommy."

"What! all that road! Do you want me to lose my child as well as my man?"

"Oh! Mrs. Falcon!"

"Don't speak to her, doctor, to get your nose snapped off: give her time. She'll come to her senses before she dies."

Next day Mrs. Falcon and Staines started for Cape Town. Staines paid her every attention, when opportunity offered. But she was sullen and gloomy, and held no converse with him.

He landed her at an inn, and then told her he would go at once to the jeweler's. He asked her piteously would she lend him a pound or two to prosecute his researches. She took out her purse without a word, and lent him two pounds. He began to scour the town. The jewelers he visited could tell him nothing. At last he came to a shop, and there he found Mrs. Falcon making her inquiries independently. She said, coldly, "You had better come with me, and get your money and things."

She took him to the bank—it happened to be the one she did business with—and said, "This is Doctor Christie, come for his money and jewels."

There was some demur at this; but the cashier recognized him, and Phœbe making herself responsible, the money and jewels were handed over.

Staines whispered Phœbe, "Are you sure the jewels are mine?"

"They were found on you, Sir."

Staines took them, looking confused. He did not know what to think. When they got into the street again he told her it was very kind of her to think of his interest at all.

No answer. She was not going to make friends with him over such a trifle as that.

By degrees, however, Christopher's zeal on her behalf broke the ice; and besides, as the search proved unavailing, she needed sympathy; and he gave it her, and did not abuse her husband, as Dick Dale did.

One day, in the street, after a long thought, she said to him, "Didn't you say, Sir, you gave him a letter for me?"

"I gave him two letters; one of them was to you."

"Could you remember what you said in it?"

"Perfectly. I begged you, if you should go to England, to break the truth to my wife. She is very excitable; and sudden joy has killed ere now. I gave you particular instructions."

"And you were very wise. But whatever could make you think I would go to England?"

"He told me you only wanted an excuse."

"Oh!"

"When he told me that, I caught at it, of course. It was all the world to me to get my Rosa told by such a kind, good, sensible friend as you: and, Mrs. Falcon, I had no scruple about troubling you; because I knew the stones would sell for at least a thousand pounds more in England than here, and that would pay your expenses."

"I see, Sir: I see. 'Twas very natural: you love your wife."

"Better than my life."

"And he told you I only wanted an excuse to go to England?"

"He did indeed. It was not true?"

"It was any thing but true. I had suffered so in England: I had been so happy here: too happy to last. Ah! well, it is all over. Let us think of the matter in hand. Sure that was not the only letter you gave my husband? Didn't you write to *her*?"

"Of course I did; but that was inclosed to you, and not to be given to her until you had broken the joyful news to her. Yes, Mrs. Falcon, I wrote and told her every thing: my loss at sea; how I was saved, after, by your kindness. Our journeys—from Cape Town—and then to the diggings, my sudden good fortune—my hopes—my joy—oh, my poor Rosa! and now I suppose she will never get it. It is too cruel of him. I shall go home by the next steamer. I *can't*

stay here any longer, for you or any body. Oh, and I inclosed my ruby ring, that she gave me, for I thought she might not believe you without that."

"Let me think," said Phœbe, turning ashy pale. "For mercy's sake, let me think."

"He has read both those letters, Sir."

"She will never see hers; any more than I shall see mine."

She paused again, thinking harder and harder.

"We must take two places in the next mail steamer. I must look after my husband; AND YOU AFTER YOUR WIFE."

HAWAII-NEI.*

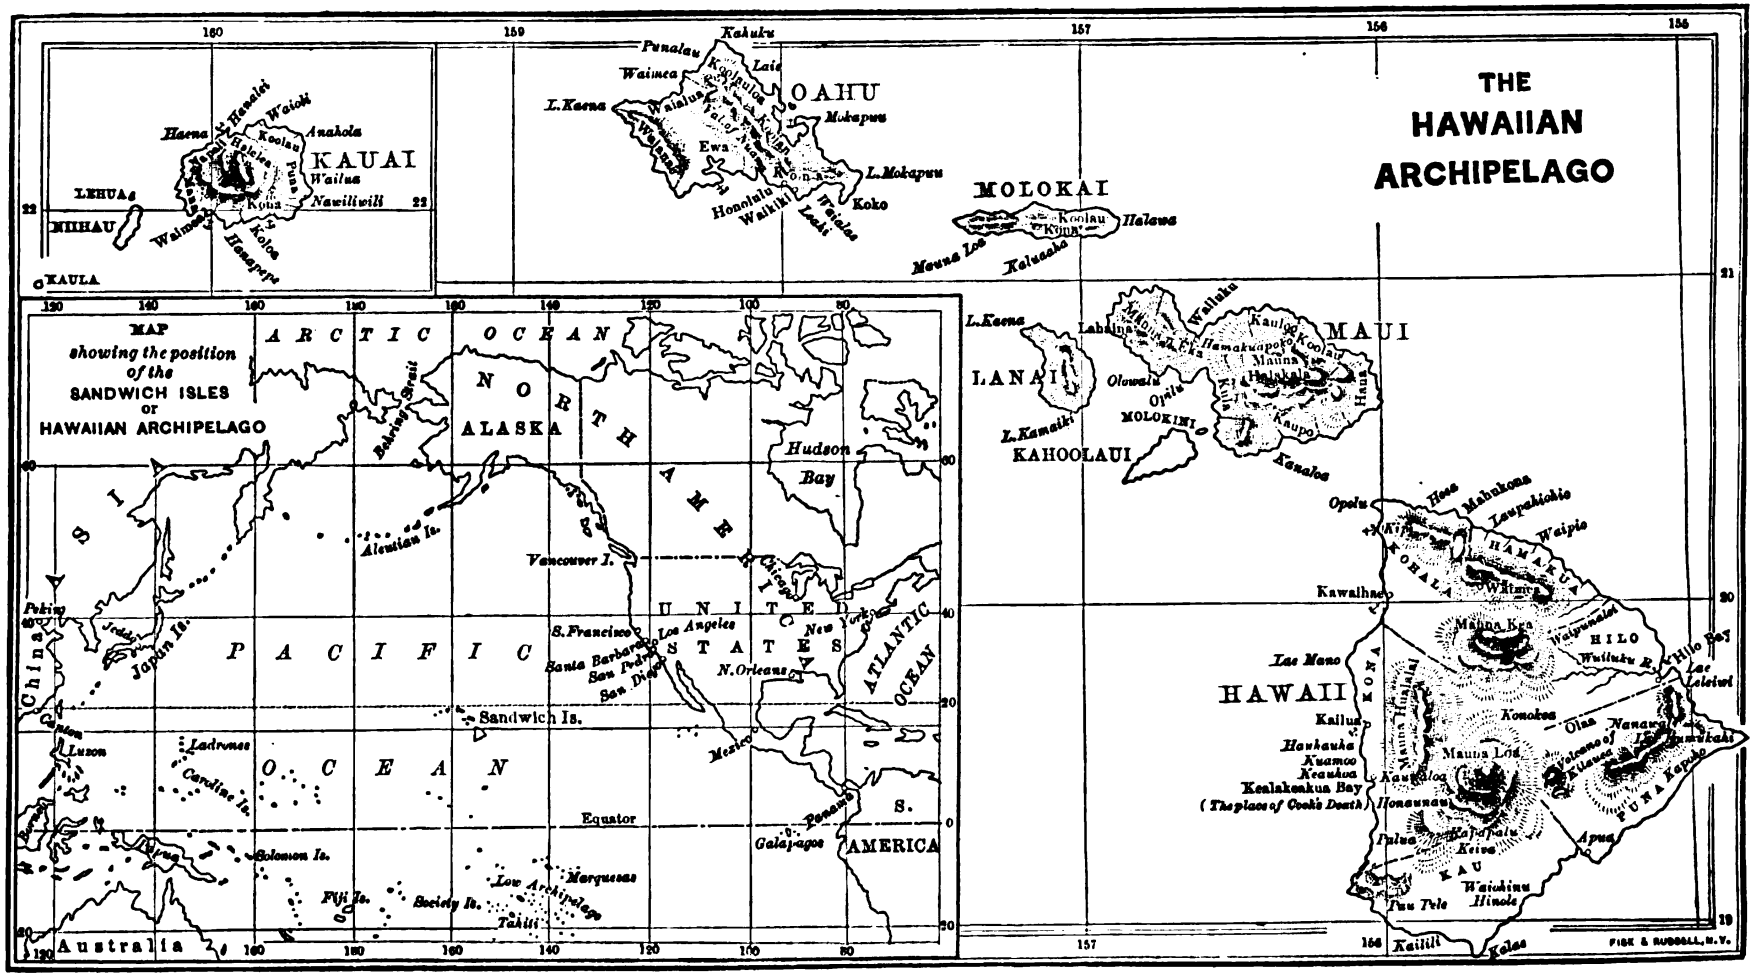
BY CHARLES NORDHOFF.

I.—HONOLULU AND HILO, WITH SOME CRATERS.

THE Hawaiian or Sandwich Islands were discovered—or rediscovered, as some say—by Captain Cook, in January, 1778, a year and a half after our Declaration of Independence. The inhabitants were then what we call savages—that is to say, they wore no more clothing than the climate made necessary, and knew nothing of the Christian religion. In the period between 1861 and 1865 this group had in the Union armies a brigadier-general, a major, several other officers, and more than one hundred private soldiers and seamen, and its people contributed to the treasury of the Sanitary Commission a sum larger than that given by most of our own States.

In 1820 the first missionaries landed on the shores of these islands, and Mrs. Lucy G. Thurston, one of those who came in that year, still lives, a bright, active old lady, with a shrewd wit of her own. Thirty-three years afterward, in 1853, the American Board of Missions determined that "the Sandwich Islands, having been Christianized, shall no longer receive aid from the board;" and in this year, 1873, the natives of these islands are, there is reason to believe, the most generally educated people in the world. There is scarcely a Hawaiian, man, woman, or child of suitable age, but can both read and write. All the towns and many country localities possess substantial stone or, more often, framed churches, of the oddest New England pattern; and a compulsory education law draws every child into the schools, while a special tax of two dollars on every voter, and an additional general tax, provide schools and teachers for all the children and youth.

Nine hundred and three thousand dollars were given by Christian people in the United States during thirty-five years to accomplish this result; and to-day the islands themselves support a missionary society, which sends the Gospel, in the hands of native missionaries, into other islands at its own cost, and not only supports more than a dozen "foreign" missionaries, but translates parts of the Bible into other Polynesian tongues.



The Hawaiian group consists, as you will see on the map, of eleven islands, of which Hawaii is the largest and Molokini the smallest. The islands together contain about 6000 square miles; and of this Hawaii has an area of nearly 4000 square miles, Maui 620, Oahu (which contains Honolulu, the capital) 530, and Kauai 500. Lanai, Kahoolaui, Molokai, Niihau, Kaula, Lehua, and Molokini are small islands. All are of volcanic origin, mountainous, and Hawaii contains the largest active crater in the world, Kilauea, one of the craters of Mauna Loa; while Maui contains the largest known extinct crater, Halakala, the House of the Sun, a pit nine miles in diameter and two thousand feet deep. Mauna Loa and Mauna Kea are nearly 14,000 feet high, as high as Mount Grey, in Colorado; and you can not ride any where in the islands without seeing extinct craters, of which the hill called Diamond Head, near Honolulu, is an example.

The voyage from San Francisco to Honolulu lasts from eight to ten days, and is, even to persons subject to seasickness, very enjoyable, because after the second day the weather is charmingly warm, the breezes usually mild, and the skies sunny and clear. In forty-eight hours after you leave the Golden Gate, shawls, overcoats, and wraps are discarded. You put on thinner clothing. After breakfast you will like to spread rugs on deck and lie in the sun, fanned by deliciously soft winds, and before you see Honolulu you will even like to have an awning spread over you to keep off the sun. When they seek a tropical climate, our brethren on the Pacific coast have no such rough voyage as that across the Atlantic to endure. On the bay you see flying-fish, and if you are lucky, an occasional whale or a school of porpoises. And you sail over the lovely blue of the Pacific Ocean, which has not only softer gales but even a different shade of color than the fierce Atlantic.

We made the land at daylight on the tenth day of the voyage, and by breakfast-time were steaming through the Molokai Channel, with the high, rugged, and bare volcanic cliffs of Oahu close aboard, the

* This is the title of the collective kingdom of Hawaii.

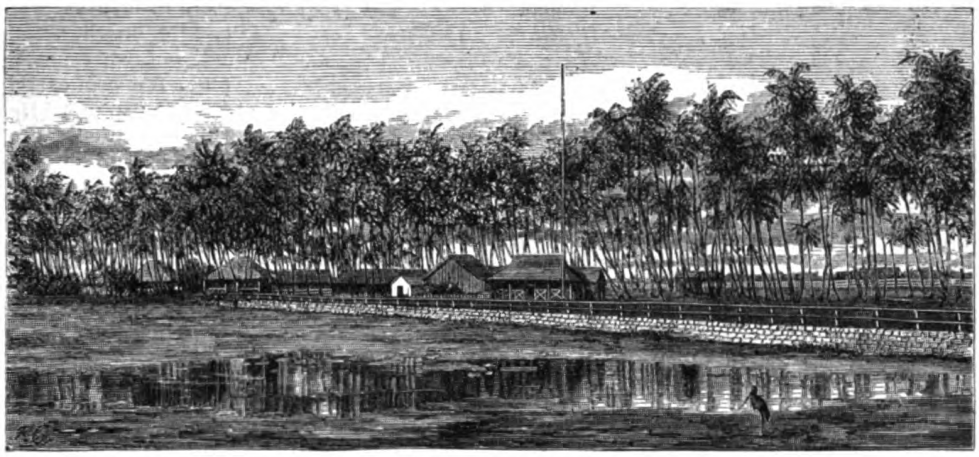
surf beating against the shore vehemently. An hour later we rounded Diamond Head, and sailing past Waikiki, which is the Long Branch of Honolulu, charmingly placed amidst groves of cocoa-nut trees, turned sharp about, and steamed through a narrow channel into the landlocked little harbor of Honolulu, smooth as a mill-pond. It is not until you are almost within the harbor that you get a fair view of the city, which lies embowered in palms and fine tamarind-trees, with the tall fronds of the banana peering above the low-roofed houses; and thus the tropics come, after all, somewhat suddenly upon you, for the land which you have skirted all the morning is by no means tropical in appearance, and the cocoa-nut groves of Waikiki will disappoint you on the first and too distant view, which gives them the insignificant appearance of tall reeds. But your first view of Honolulu, that from the ship's deck, is one of the pleasantest you can get: it is a view of gray house-tops, hidden in luxuriant green, with a background of volcanic mountains three or four thousand feet high, and an immediate foreground of smooth harbor, gay with man-of-war boats, native canoes, and flags, and the wharf, with ladies in carriages, and native fruit-vendors in what will seem to you brightly colored night-gowns, ready to sell you a feast of bananas and oranges.



There are several other fine views of Honolulu, especially that from the lovely Nuanu Valley, looking seaward over the town, and one from the roof of the prison, which edifice, clean, roomy, and, in the daytime, empty, because the convicts are sent out to labor on public works and roads, has one of the finest situations in the town's limits, directly facing the Nuanu Valley.

From the steamer you proceed to a surprisingly excellent hotel, which was built (at a cost of about $120,000), and is owned, by the government. It is, as you will see (page 393), a large building, and affords all the conveniences of a first-class hotel in any part of the world. It is built of a concrete stone made here, and as it has roomy, well-shaded court-yards and deep, cool piazzas, and breezy halls and good rooms, and baths and gas, and a billiard-room, you might imagine yourself in San Francisco, were it not that you drive in under the shade of cocoa-nut, tamarind, guava, and algeroba trees, and find all the doors and windows open. It is told here that the building of this hotel cost two of the late king's cabinet, Mr. Harris and Dr. Smith, their places. The Hawaiian people are economical, and not very enterprising; they dislike debt, and a considerable part of the Hawaiian national debt was contracted to build this hotel. You will feel sorry for Messrs. Harris and Smith, who were for many years two of the ablest members of the Hawaiian cabinet, but you will feel grateful for their enterprise also, when you hear that before this hotel was completed—that is to say, until last year—a stranger landing in Honolulu had either to throw himself on the hospitality of the citizens, take his lodgings in the Sailors' Home, or go back to his ship. It is not often that cabinet ministers fall in so good a cause, or incur the public displeasure for an act which adds so much to the comfort of mankind.

The mercury stands between 68° and 81° in the winter months in Honolulu. The mornings are often a little overcast until about half past nine, when it clears away bright. The hottest part of the day is before noon. The trade-wind usually blows, and when it does it is always cool; with a south wind, it is sometimes a little sultry before noon. The nights are cool enough for sound rest, but not cold. It is not by any means a torrid climate, at least in winter, and it has, perhaps, the fewest daily extremes of any pleasant climate in the world. For instance, the mercury ranged in January between 69° at 7 A.M., 75½° at 2 P.M., and 71½° at 10 P.M. The highest temperature in that month was 78°, and the lowest 68°. December and January are usually the coolest months in the year at Honolulu, but the variation is extremely slight for the whole year, the maximum of the warmest day in July (still at Honolulu) being only 86°, and this at noon, and the lowest mark being 62°, in the early morning in December. A friend of mine resident here during twenty years has never had a blanket in his house.

It follows naturally that the climate is an excellent one for consumptives, and physicians here point to numerous instances of the kindly and healing effect of the mild air. At the same time I suspect it must in the long-run be a little debilitating to Americans. It is a charming climate for children; and as sea-bathing is possible and pleasant at all times, those who derive benefit from this may here enjoy it to the fullest extent during all the winter months. Of course you wear thin, but not the thinnest, clothing. White is appropriate to the climate; but summer flannels are comfortable in winter here. The air is seldom as sultry as in New York in July or August, and the heat is by no means oppressive, there being almost always a fresh breeze. Honolulu has the reputation of being the hottest place on the islands; and in a mountainous country like this you may choose your temperature, of course. The summits of the highest peaks on Hawaii are covered with almost perpetual snow; and there are sugar planters who might sit around a fire every night in the year. Unlike California, there is no special rainy season here; but those points which are most directly exposed to the trade-winds have a great deal of rain,

COCOA-NUT GROVE, AND RESIDENCE OF THE LATE KING KAMEHAMEHA V., AT WAIKIKI, HONOLULU.

and those which lie away from the trades have but little. At Hilo it sometimes rains for a month at a time; at Lahaina it hardly ever rains; and Honolulu is a pleasant place for travelers to stay in, because it also has but little rain. It rains more or less in every month in the year, all over the islands; and you can not therefore count certainly on a fair day, as in the dry season in California, though the residents know how to forecast the weather. It results that the grass remains green, except in the dry districts, all the year round, and the lawn grass here is the creeping Bermuda grass, which has lately been introduced in our Southern States, and which has a fine deep green color, and covers the ground admirably, making most beautiful lawns. Strawberries, too, you may eat in every month of the year; in the month of February we have them at every meal, and as they have an ice factory in Honolulu, we eat strawberries and ice-cream as though it were June or July at home.

One of the pleasant surprises which meet a Northern traveler in these islands is the number of strange dishes which appear on the table and in the bill of fare. Strawberries, oranges—the sweetest and juiciest I have eaten any where, except, perhaps, in Rio de Janeiro—bananas, and cocoa-nuts you have at will; but, besides these, there is at this season the guava, very nice when it is sliced like a tomato, and eaten with sugar and milk; taro, which is the potato of the country, and, in the shape of poi, the main subsistence of the native Hawaiian; bread-fruit; flying-fish, the most tender and succulent of the fish kind; and, in their sea-

THE PALACE, HONOLULU.

son, the mango, the custard-apple, the alligator-pear, the water-lemon, the rose-apple, and other fruits. Taro, when baked, is an excellent and wholesome vegetable, and from its leaves is cooked a fine substitute for spinach, called *luau*. Poi also appears on your hotel table, being the national dish, of which many foreigners have become very fond. It is very fattening, and is sometimes prescribed by physicians to consumptives. As you drive about the suburbs of Honolulu you will see numerous taro patches, and may frequently see the natives engaged in the preparation of poi, which consists in boiling the root, or tuber, and then mashing it very fine, so that if dry it would be a flour. It is then mixed with water, and for native use left to undergo a slight fermentation. Fresh or unfermented poi has a pleasant taste; when fermented it tastes to me like book-binder's paste, and a liking for it must be acquired rather than natural, I should say, with foreigners.

So universal is its use among the natives that the manufacture of poi is carried on now by steam-power and with Yankee machinery for the sugar planters; and the late king, who was avaricious and a trader, incurred the dislike of his native subjects by establishing a poi factory of his own near Honolulu. Poi is sold in the streets in calabashes, but it is also shipped in considerable quantities to other islands, and especially to guano islands which lie southward and westward of this group. On these lonely islets, many of which have not even drinking-water for the laborers who live on them, poi and fish are the chief if not the only articles of food. The fish, of course, are caught on the spot, but poi, water, salt, and a few beef cattle for the use of white superintendents are carried from here.

Taro is a kind of *arum*. It grows, unlike any other vegetable I know of, unless it be rice, entirely under water. A taro patch is surrounded by embankments; its bottom is of puddled clay, and in this the cutting, which is simply the top of the plant with a little of the tuber, is set. The plants are set out in little clumps in long rows, and a man at work in a taro patch stands up to his knees in water. Forty square feet of taro, it is estimated, will support a person for a year, and a square mile of taro will feed over 15,000 Hawaiians.

By-the-way, you will hear the natives say *kalo* when they speak of taro, and by this and other words in common use you will presently learn of a curious obliquity in their hearing. A Hawaiian does not notice any difference in the sounds of *r* and *l*, of *k* and *t*, or of *b*, *p*, and *f*. Thus the Pali, or precipice near Honolulu, is spoken of as the Pari; the island of Kauai becomes to a resident of it Tauwai, though a native of Oahu calls it Kauai; taro is almost universally called *kalo;* and the common salutation, *Aloha*, which means "love to you," and is the national substitute for "How do

you do?" is half the time *Aroha;* Lanai is indifferently called Ranai; and Mauna Loa is in the mouths of most Hawaiians Mauna Roa. Indeed, in the older charts the capital of the kingdom is called Honoruru.

Honolulu, being the capital of this kingdom, contains the government offices; and you will perhaps be surprised, as I was, to find an excellent public hospital, a reform school, and other proper and well-managed charities. When you have visited these and some of the numerous schools and the native churches, and have driven or ridden to Waikiki for a sea-bath, and have seen the Nuanu Valley and the precipice called the Pali, if you are American, and familiar with New England, it will be revealed to you that the reason why all the country looks so familiar to you is that it is really a very accurate reproduction of New England country scenery. The white frame houses with green blinds, the picket-fences whitewashed until they shine, the stone walls, the small barns, the scanty pastures, the little white frame churches scattered about, the narrow "front-yards," the frequent school-houses, usually with but little shade, all are New England, genuine and unadulterated; and you have only to eliminate the palms, the bananas, and other tropical vegetation to have before you a fine bit of Vermont, or the stonier parts of Massachusetts. The whole scene has no more breadth nor freedom about it than a petty New England village, but it is just as neat, trim, orderly, and silent also. There is even the same propensi-

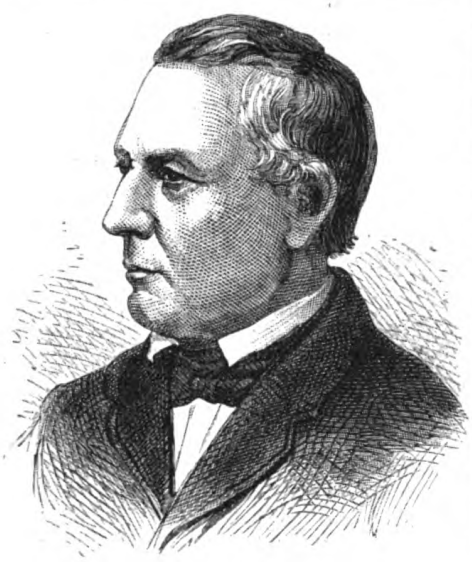
GOVERNMENT BUILDINGS, HONOLULU.

about the suburbs of Honolulu, and later as you travel about the islands, more and more you will be impressed with a feeling of respect and admiration for the missionaries. Whatever of material prosperity has grown up here is built on their work, and could not have existed but for their preceding labors; and you see in the spirit of the people, in their often quaint habits, in their universal education, in all that makes these islands peculiar and what they are, the marks of the Puritans who came here but fifty years ago to civilize a savage nation, and have done their work so thoroughly that even though the Hawaiian people became extinct, it would



ty to put all the household affairs under one roof which was born of a severe climate in Massachusetts, but has been brought over to these milder suns by the incorrigible Puritans who founded this bit of civilization.

In fact, the missionaries have left an indelible mark upon these islands. You do not need to look deep to know that they were men of force, men of the same kind as they who have left an equally deep impress upon so large a part of our Western States; men and women who had formed their own lives according to certain fixed and immutable rules, who knew no better country than New England, nor any better ways than New England ways, and to whom it never occurred to think that what was good and sufficient in Massachusetts was not equally good and fit in any part of the world. Patiently, and somewhat vigorously, no doubt, they sought from the beginning to make New England men and women of these Hawaiians, and what is wonderful is that, to a large extent, they have succeeded. As you ride

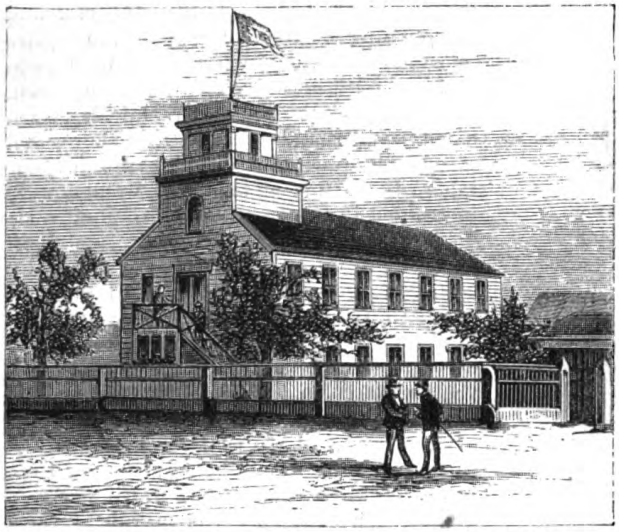
DR. JUDD.

require a century to obliterate the way-marks of that handful of determined New England men and women.

Of those who began this good work but few now remain. Most of them have gone to their reward, having no doubt suffered as well as accomplished much. Of the first band who came out from the United States the only one now living is Mrs. Lucy G. Thurston, whose portrait you will find on the preceding page—a bright, active, and lively old lady of seventy-five years, who drives herself to church on Sundays in a one-horse chaise, and has her own opinions of passing events. How she has lived in the tropics for fifty years without losing even an atom of the New England look puzzles you; but it shows you also the strength which these people brought with them, the tenacity with which they clung to their habits of dress and living and thought, the remorseless determination which they imported, with their other effects, around Cape Horn.



Then there is Dr. Judd, who came out as physician to the mission, and proved himself here, as the world knows, a very able man, with statesmanship for some great emergencies, which made him for years one of the chief advisers of the Hawaiian kings. Dr. Judd has lately suffered a slight stroke of paralysis, from which he is slowly recovering; and it was to me a most touching sight to see, on a Sunday after church, Mrs. Thurston, his senior by many years, but still alert and vigorous, taking hold of his hand, and tenderly helping him out of the church and to his carriage.

And in Hilo, when you go to visit the volcano, you will find Dr. Coan, one of the brightest and loveliest spirits of them all, the story of whose life in the remote island whose apostle he was is as wonderful and as touching as that of any of the earlier apostles, and shows what great works unyielding faith and love can do in redeeming a savage people. When Dr. and Mrs. Coan came to the island of Hawaii its shores and woods were populous, and through their labors thousands of men and women were instructed in the truths of Christianity, inducted into civilized habits of life, and finally brought into the church. As you sail along the green coast of Hawaii from its northern point to Hilo, you will be surprised at the number of quaint little white churches which mark the distances almost with the regularity of mile-stones; if, later, you ride through this district or the one south of Hilo, you will see that for every church there is also a school-house; you will see native children reading and writing as well as our own at home; you may hear them singing tunes familiar in our own Sunday-schools; you will see the native man and woman sitting down to read their newspaper at the close of day; and if you could talk with them you would find they knew almost as much about our late war as you do, for they took an intense interest in the war of the rebellion. And you must remember that when, less than forty years ago, Dr. and Mrs. Coan came to Hilo, the people were naked savages, with no church and but one school-house in the district, without printed books or knowledge of reading. They flocked to hear the Gospel. Thousands removed from a distance to Hilo, where, in their rapid way, they built up a large town, and kept up surely the strangest "protracted meeting" ever held; and going back to their homes after many months, they took with them knowledge and zeal to build up

BETHEL CHURCH.

Christian churches and schools of their own. Over these Dr. Coan has presided these many years, not only preaching regularly on Sundays and during the week in the large native church at Hilo, and in two or three neighboring churches, but visiting the more distant churches at intervals, to examine and instruct the members, and keep them all on the right track. He has seen a region very populous when he first came to it decrease until it has now many more deserted and ruined house places than inhabited dwellings; but also he has seen a great population turned from darkness to light, a great part of it following his own blameless and loving life as an example, and very many living to old age steadfast and zealous Christians.

On your first Sunday at Honolulu you will probably attend one or other of the native churches. They are commodious buildings, well furnished; and a good organ, well played, will surprise you. Sunday is a very quiet day in the islands: they are a church-going people; and the empty seats in the Honolulu native churches give you notice of the great decrease in the population since these were built.

If you go to hear preaching in your own language, it will probably be to the seamen's chapel, where the Rev. Dr. Damon preaches—one of the oldest and one of the best-known residents of Honolulu. This little chapel was brought around Cape Horn in a whale-ship many years ago in pieces, and was, I believe, the first American church set up in these islands. It is a curious old relic, and has seen many changes. Mr. Damon has lived here many years of a most zealous and useful life as seamen's chaplain. He is, in his own field, a true and

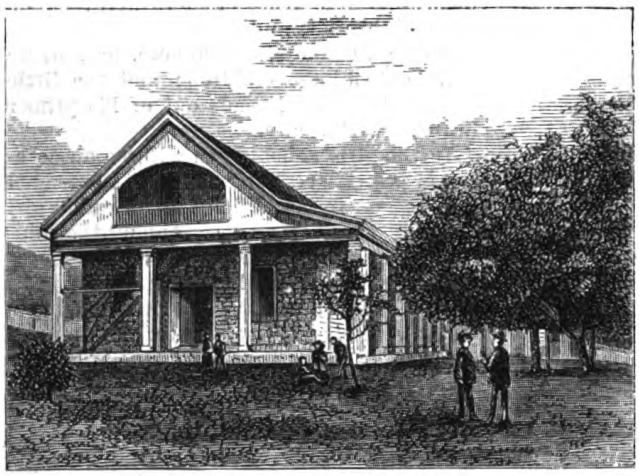
DR. DAMON.

untiring missionary, and to his care the port owes a clean and roomy seamen's home, a valuable little paper, *The Friend*, which was for many years the chief reading of the whalemen who formerly crowded the ports of Hawaii, and help in distress, and fatherly advice, and unceasing kindness at all times to a multitude of seamen during nearly thirty years. The sailors, who quickly recognize a genuine man, have dubbed him "Father Damon;" and he deserves what he has long had, their confidence and affection.

The charitable and penal institutions of Honolulu are quickly seen, and deserve a visit. They show the care with which the government has looked after the welfare of the people. The Queen's Hospital is an admirably kept house. At the reform school you will see a number of boys trained and educated in right ways. The prison not only deserves a visit for itself, but from its roof you obtain, as I said before, one of the best views of Honolulu and the adjacent country and ocean. Then there are native schools, elementary and academic, where you will see the young Hawaiian at his studies, and learn to appreciate the industry and thoroughness with which education is carried on all over these islands. You will see also curious evidence of the mixture of races here; for on the benches sit, and in the classes recite, Hawaiian, Chinese, Portuguese, half white and half Chinese children; and the little pigtailed Celestial reads out of his primer quite as well as any.



In the girls' schools you will see an occasional pretty face, but fewer than I expected to see; and to my notion the Hawaiian girl is rarely very attractive. Among the middle-aged women, however, you often meet with fine heads and large expressive features. The women have not unfrequently a majesty of carriage and a tragic intensity of features and expression which are quite remarkable. Their loose dress gives grace as well as dignity to their movements; and whoever invented it for them deserves more credit than he has received. It is a little startling at first to see women walking about in what, to our perverted tastes, look like calico or black stuff night-gowns; but the dress grows on you as you become accustomed to it; it lends itself readily to bright ornamentation; it is eminently fit for the climate; and a stately Hawaiian dame, marching through the street, in black *holaku*—as the dress is called—with a long necklace, or *le*, of bright scarlet or brilliant yellow flowers, bare and untrammeled feet, and flowing hair, compares very favorably with a high-heeled, wasp-waisted, absurdly bonneted, fashionable white lady.

When you have seen Honolulu and the Nuanu Valley, and bathed and drank cocoanut milk at Waikiki, you will be ready for a charming excursion—the ride around the Island of Oahu. To this you should take several days. It is most pleasantly made by a party of three or four persons, and ladies, if they can sit in the saddle at all, can very well do it. You should provide yourself with a pack-mule, which will carry not only spare clothing, but some provisions; and your guide ought to take care of your

ROYAL SCHOOL, HONOLULU.

horses, and be able, if necessary, to cook you a lunch. The ride is easily done in four days, and you will sleep every night at a plantation or ranch. For such excursions, and for your daily use in Honolulu, you can hire a good horse, well saddled and bridled, for six dollars per week; in which case you have no care of the animal, nor responsibility for it, and have it brought to you every morning at your hotel, in good condition. The proprietor of the hotel is most obliging, and will make all arrangements of this kind for you, and see that you are not swindled. The horses are better than I was led to expect; they are sure-footed and docile.

Every body rides in Honolulu, and it is the pleasantest way of getting about. But you can also hire carriages, and there are many pleasant short drives for those who will not ride. But I advise all who come here to ride, because you can not see the volcano except by a tolerably tiresome horseback journey from Hilo.

Hilo, as you will perceive on the map, is on the island of Hawaii. You get there from Honolulu in the little steamer *Kilauea*, which runs between the different islands. The charge is fifteen dollars from Honolulu to Hilo, or twenty-five dollars for the round

HAWAIIAN HOTEL, HONOLULU.—[SEE PAGE 384.]

trip. The cabin is small, and if you have fine weather you will, even if you are a lady, pass the time more pleasantly on deck, where the steward, a Goa man, and the most assiduous and tactful of his trade, will place a mattress and blankets for you. You must expect to suffer somewhat from sea-sickness if you are subject to that ill, for the passage is not unlikely to be rough. On the way you see Lahaina, and a considerable part of the island of Hawaii; in fact, you are never out of sight of land.

If you start on Monday evening you will reach Hilo on Wednesday—and "about this time expect rain," as the almanac-makers say. They get about seventeen feet of rain

THE VOLCANO HOUSE.

at Hilo during the year; and as they have sometimes several days without any at all, you must look for not only frequent but heavy showers. A Hilo man told me of a curious experiment which was once made there. They knocked the heads out of an oil cask—so he said—and it rained in at the bung-hole faster than it could run out at the heads. You may disbelieve this story if you please; I tell it as it was told me; but in any case you will do well to provide yourself, for Hilo and the volcano journey, with stout water-proof clothing. Indeed, you need this for traveling any where on the islands.

Hilo—on those days when the sun shines—is one of the prettiest places on the islands. If you are so fortunate as to enter the bay on a fine day, you will see a very tropical landscape—a long, pleasant, curved sweep of beach, on which the surf is breaking, and beyond, white houses nestling among cocoa-nut groves, and bread-fruit, pandanus, and other Southern trees, with shops and stores along the beach. Men bathing in the surf, and men and women dashing on horseback over the beach, make up the life of the scene.

Hilo has no hotel; it has not even a carriage; but it has a very agreeable and intelligent population of Americans, and you will find good accommodations at the large house of Mr. Severance, the sheriff of Hawaii. If his house should be full, you need not be alarmed, for some one will take you in.

This is the point of departure for the volcano. Here you hire horses and a guide for the journey. Having gone to Hilo on the

steamer, you will do best to return to Honolulu by a schooner, as this will give you abundant time to make the journey, and will not unnecessarily delay you. Unless you intend a more thorough exploration of Hawaii, your pleasantest plan is to ride from Hilo by the direct road to the crater, and return by way of Puna. You will have ridden a trifle over 100 miles through a very remarkable and in some parts a beautiful country; you will have slept one night in a native house, and will have seen as much as you want of Hawaiian life, and enjoyed a tiring but at the same time a very novel journey.

The charges are sufficiently moderate. At Hilo you pay for board and lodgings eight dollars per week. The charge for horses is ten dollars each for the volcano journey, with a dollar a day for your guide. This guide relieves you of all care of the animals, and is in various ways useful. At the Volcano House the charge for horse and man is five dollars per day, and you pay half price for your guide. There is a charge of one dollar for a special guide into the crater, which is made in your bill, and you will do well to promise this guide, when you go in, a small gratuity—half a dollar, or, if your party is large, a dollar—if he gives you satisfaction. He will get you specimens, carry a shawl for a lady, and make himself in other ways helpful.

When you get on your horse at Hilo for the volcano, leave behind you all hope of good roads. You are to ride for thirty miles over a lava bed, along a narrow trail, as well made as it could be without enormous expense, but so rough, so full of mud-holes filled with broken lava in the first part of the journey, and so entirely composed of naked, jagged, and ragged lava in the remainder, that one wonders how the horses stand it. A canter, except for two or three miles near the Volcano House, is almost out of the question; and though the Hawaiians trot and gallop the whole distance, a stranger will scarcely follow their example. You should insist, by-the-way, upon having all your horses reshod the day before they leave Hilo; and it is prudent even then to take along a pair of shoes and a dozen or two horse-nails. The lava is extremely trying to the horse's shoes, and if your horse casts a shoe he will go lame in fifteen minutes, for the jagged lava cuts almost like glass.

KAMEHAMEHA I.

Moreover, do not wait for a fine day; it will probably rain, at any rate, before you reach the Volcano House, and your wisest way is to set out resolutely, rain or shine, on the appointed morning, for the sun may come out two or three hours after you have started in a heavy rain. Each traveler should take his water-proof clothing upon his own saddle—it may be needed at any time—and the pack-mule should carry not only the spare clothing, well covered with India rubber blankets, but also an abundant lunch, to be eaten at the Half-way House.

India rubber or leather leggings, and a long sleeveless Mackintosh, seem to

EMMA, QUEEN OF KAMEHAMEHA IV.

me the most comfortable and sufficient guards against weather. Ladies should ride astride; they will be most comfortable thus. There are no steep ascents or abrupt descents on the way. Kilauea is nearly 4000 feet higher than the sea, from which you set out; but the rise is so gradual and constant that, if the road were good, one might gallop a horse the whole distance. You should set out not later than half past seven, and make up your mind not to be hurried on the way. There are people who make the distance in six hours, and boast about it; but I accomplished it with a party of ladies and children in ten hours with very little discomfort, and did not envy the six-hour people. There is nothing frightful, or dangerous, or disagreeable about the journey, even to ladies not accustomed to riding; and there is very much that is new, strange, and wonderful to Americans or Europeans. Especially you will be delighted with the great variety and beauty of the ferns, which range from minute and delicate species to the dark and grand fronds of the tree-fern, which rises in the more elevated region to a height of twenty feet, and has sometimes a diameter of three or four feet. From a variety of this tree-fern the natives take a substance called pulu, a fine, soft, brown fuzz, used for stuffing pillows and mattresses.

Your guide will probably understand very little English: let him be instructed in your wishes before you set out. The native Hawaiian is the most kind and obliging creature in the world, and you will find your guide ready to do you every needful service. You can get nothing to eat on the road, except, perhaps, a little sugar-cane; therefore you must provide a sufficient lunch. At the Half-way House, but probably nowhere else, you will get water to drink.

When you reach the Volcano House I advise you to take a sulphur vapor bath, refreshing after a tedious ride, and after supper you will sit about a big open fire, and recount the few incidents and adventures of the day.

The next day you give to the crater. Unless the night is very foggy you will have gone to sleep with the lurid light of Kilauea in your eyes. Madame Pele, the presiding goddess of the volcano, exhibits fine fireworks at night sometimes, and we saw the lava spurting up in the air above the edge of the smaller and active crater, one night, in a quite lively manner. On a moderately clear night the light from the burning lakes makes a very grand sight, and the bedrooms at the little Volcano House are so placed that you have Madame Pele's fire-works before you all night.

The house stands but a few feet from the edge of the great crater, and you have no tedious preliminary walk, but begin your descent into the pit at once. For this you need stout shoes, light clothing, and, if you have ladies in your party, a heavy shawl for each. The guide takes with him a canteen of water. You should start about nine o'clock, and give the whole day to the crater, returning to dinner at five.

The great crater of Kilauea is three miles in circumference, and perhaps a thousand feet deep. It is, in fact, a deep pit, bounded on all sides by precipitous rocks. The entrance is effected by a series of steps, and

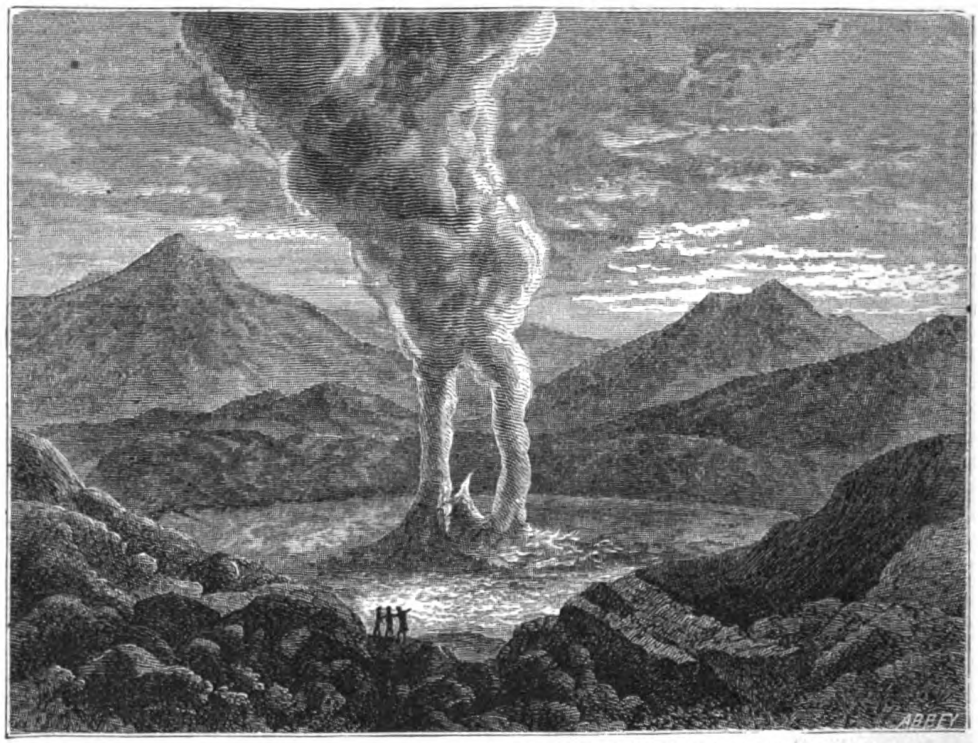
LUNALILO, THE NEW KING.

below these by a scramble over lava and rock débris. It is not difficult, but the ascent is tiresome, and it is a prudent precaution, if you have ladies with you, to take a native man for each lady, to assist her over the rougher places, and up the steep ascent. The greater part of the crater is at present a mass of dead though not cold lava, and over this you walk to the farther extremity of the pit, where you must ascend a tolerably steep hill of lava, which is the bank of the fiery lake. The distance from the Volcano House to the edge of the lake is, by the road you take, three miles.



The goddess Pele is, as some say all her sex are, variable, changeable, mutable. What I shall tell you about the appearance of the crater and lake is true of that time; it may not be true a week later; it was certainly not correct a month before. We climbed into the deep pit, and then stood upon a vast floor of lava, rough, jammed together, broken, jagged, steaming out a hot sulphurous breath at almost every seam, revealing rolls of later lava injections at every deep crack, with caverns, and high ridges where the great mass, after cooling, was jammed together, and with a steep mountain-side of

CRATER OF KILAUEA.

lava at our left, along the foot of which we clambered. This floor of lava, which seems likely to be a more or less permanent feature, was three or four years ago upon a level with the top of the high ridge whose base you skirt. The main part of the crater was then a floor of lava vaster even than it now is. Suddenly, one day, and with a crash

SURF BATHING.

which persuaded one or two persons at the Volcano House that the whole planet was flying to pieces, the greater part of this lava floor sunk down, or fell down, a depth of about five hundred feet, to the level whereon we now walked. The wonderful tale was plain to us, as we examined the details on the spot. It was as though a top-heavy and dried-out pie-crust had fallen in in the middle, leaving a part of the circumference bent down, but clinging at the outside to the dish.

After this great crash the lava seems from time to time to have boiled up from beneath through cracks, and now lies in great rolls upon the surface, or in the deeper cracks. It is related that later the lake or caldron at the farther end of the crater boiled over, and sent down streams of lava, which meandered over the black plain; that, continuing to boil over at intervals, this lake increased the height of its own banks, for the lava cools very rapidly; and thus was built up a high hill, which you ascend after crossing the lava plains, in order to look down, in fear and wonder, upon the awful sight below.

What we saw there on the 3d of March, 1873, was two huge pits, caldrons, or lakes filled with a red, molten, fiery, sulphurous, raging, roaring, restless mass of matter, to watch whose unceasing tumult was one of the most fascinating experiences of my life.

The two lakes are separated by a narrow and low-lying ledge or peninsula of lava, which I was told they frequently overflow, and sometimes entirely melt down. Standing upon the northern bank, we could see both lakes, and we estimated their shortest diameter to be about 500 feet, and the longest about one-eighth of a mile. Within this pit the surface of the molten lava was about eighty feet below us. It has been known to sink down 400 feet, and last December it was overflowing the high banks, and sending streams of lava into the great plain by which we approached it.

What, therefore, Madame Pele will show you hereafter is uncertain. What we saw was this: two large lakes, or caldrons, each nearly circular, with the lower shelf, or bank, red-hot, from which the molten lava was repelled toward the centre without cessation. The surface of these lakes was of a lustrous and beautiful gray, and this, which was a cooling and tolerably solid scum, was broken by jagged circles of fire, which appeared of a vivid rose-color, in contrast with the gray. These circles, starting at the red-hot bank or shore, moved more or less rapidly toward the centre, where, at intervals of perhaps a minute, the whole mass of lava suddenly but slowly bulged up, burst the thin crust, and flung aloft a huge fiery wave, which sometimes shot as high as thirty feet in the air. Then ensued a turmoil, accompanied with hissing and occasionally with a dull roar, as the gases sought to escape, and spray was flung in every direction; and presently the agitation subsided, to begin again

HAWAIIAN WARRIORS.

in the same place, or perhaps in another. Meantime the fiery rings moved forward perpetually toward the centre, a new one reappearing at the shore before the old was ingulfed, and not unfrequently the mass of lava was so fiercely driven by some force from the bank near which we stood that it was ten or fifteen feet higher near the centre than at the circumference. Thus somewhat of the depth was revealed to us, and there seemed something peculiarly awful to me in the fierce glowing red heat of the shores themselves, which never cooled with exposure to the air and light.

Thus acted the first of the two lakes. But when, favored by a strong breeze, we ventured further, to the side of the furthermost one, a still more terrible spectacle greeted us. The mass in this lake was in still more violent agitation; but it spent its fury upon the precipitous southern bank, against which it dashed with a vehemence equal to a heavy surf breaking against cliffs. It had undermined this lava cliff, and for a space of perhaps 150 feet the lava beat and surged into glaring cavernous depths, and was repelled with a dull, heavy roar not exactly like the boom of breakers, because the lava is so much heavier than water, but with a voice of its own, less resonant, and, as we who listened thought, full of even more deadly fury.

It seems a little absurd to couple the word "terrible" with any action of mere dead matter, from which, after all, we stood in no very evident peril. Yet "terrible" is the word for it. Grand it was not, because in all its action and voice it seemed infernal. Though its movement is slow and deliberate, it would scarcely occur to you to call either the constant impulse from one side toward the other, or the vehement and vast bulging of the lava wave as it explodes its thin crust or dashes a fiery mass against the cliff, majestic, for devilish seems a better word.

Meantime, though we were favored with a fresh and strong breeze, bearing the sulphurous stench of the burning lake away from us, the heat of the lava on which we stood, at least eighty feet above the pit, was so great as to be almost unendurable. We stood first upon one foot, and then on another, because the soles of our feet seemed to be scorching through thick shoes. A lady sitting down upon a bundle of shawls had to rise because the wraps began to scorch; our faces seemed on fire from the reflection of the heat below; the guide's tin water canteen, lying near my feet, became presently so hot that it burned my fingers when I took it up; and at intervals there came up from behind us a draught of air so hot and so laden with sulphur that even with the strong wind carrying it rapidly away it was scarcely endurable. It was while we were coughing and spluttering at one of these hot blasts, which came from the numerous fissures in the lava which we had passed over, that a lady of our party remarked that she had read an excellent description of this place in the New Testa-

ment, and so far as I observed, no one disagreed with her.

After the lakes come the cones. When the surface of this lava is so rapidly cooling that the action below is too weak to break it, the gases forcing their way out break small vents, through which lava is then ejected. This, cooling rapidly as it comes to the outer air, forms by its accretions a conical pipe of greater or less circumference, and sometimes growing twenty or thirty feet high, open at the top, and often with openings also blown out at the sides. There are several of these cones on the summit bank of the lake, all ruined, as it seemed to me, by some too violent explosion, which had blown off most of the top, and in one case the whole of it, leaving then only a wide hole. Into these holes we looked, and saw a very wonderful and terrible sight. Far below us was a stream of lava, rolling and surging and beating against huge precipitous red-hot cliffs, and higher up, suspended from other, also red or white hot overhanging cliffs, depended huge stalactites, like masses of fiercely glowing fern leaves waving about in the subterraneous wind; and here we saw how thin was in some such places the crust over which we walked, and how near the melting-point must be its under surface. For, as far as we could judge, these little craters, or cones, rested upon a crust not thicker than twelve or fourteen inches, and one fierce blast from below seemed sufficient to melt away the whole place. Fortunately one can not stay very long near these openings, for they exhale a very poisonous breath; and so we were drawn back to the more fascinating but less terrible spectacle of the lakes, and then back over the rough lava, our minds filled with memories of a spectacle which is certainly one of the most remarkable our planet affords.

When you have seen the fiery lakes you will recognize a crater at sight, and every part of Hawaii and of the other islands will have a new interest for you; for all are full of craters, and from Kilauea to the sea you may trace several lines of craters, all extinct, but all at some time belching forth those interminable lava streams over which you ride by the way of the Puna coast for nearly seventy miles back to Hilo. I advise you to take this way back. Almost the whole of it is a land of desolation. A narrow trail across unceasing beds of lava, a trail which in spots was actually hammered down to make it smooth enough for travel, and outside of whose limits in most places your horse will refuse to go, because he knows it is too rough for beast or man, this is your road. Most of the lava is probably very ancient, though some is quite recent, and ferns and guava bushes and other scanty herbage grow through it. In some of the cavernous holes, which denote probably ancient cones, you will see a cocoa-nut tree or a pandanus trying to subsist; and by-and-by, after a descent to the sea-shore, you are rewarded with the pleasant sight of groves of cocoa-nuts and umbrageous arbors of pandanus, and occasionally with a patch of green. Almost the whole of the Puna coast is waterless. From the Volcano House you take with you not only food for the first day, but water in bottles, and your thirsty animals get none until you reach the end of your first day's journey, at Kaimu, where you can send a more than half naked native into the trees for cocoa-nuts, and drink your fill of their refreshing milk, while your jaded horses swallow bucketfuls of rain-water.

It will surprise you to find people living among the lava, making potato patches in it, planting coffee and some fruit trees in it, fencing in their small holdings, even, with lava blocks. Very little soil is needed to give vegetation a chance in a rainy season, and the decomposed lava makes a rich earth. But, except the cocoa-nut, which grows on the beach, and seems to draw its sustenance from the waves, and the sweet-potato, which does very well among the lava, nothing seems really to thrive. This is true all over the islands. If you ask about oranges, you hear that, except in a very few favored localities, the orange-tree suffers from a blight. The coffee culture has almost perished, because of "the blight." The cacao is blighted. The mulberry makes a rank growth, but the black or white blight covers it. And so with almost all useful trees and plants. A lady said to me, "In truth, every thing which has been tried on our islands seems to have failed from this blight, or scale insect, except sugar-cane, and there is scarcely a plantation of sugar, even, which has not ruined the first, and in some cases the second, owners." Wheat and other cereals are not raised, but all imported. Even the forests are now perishing, partly because cattle eat the young shoots, and partly because an insect attacks the older trees. This is a serious inconvenience, because fuel is scarce, and as the woods disappear, the water-courses dry up, and the sugar-cane has of late, I am told, begun to suffer from a worm which eats out the pith, near the ground, and thus destroys the whole cane. For general agriculture the islands are worthless. A small or general farmer would not starve here, because he could always raise enough sweet-potatoes to live on; but he would never get on. Of specialties, the sugar culture is the only one which has not entirely failed; and yet when you hear of plantations which cost $50,000 sold by the sheriff for $15,000, or of plantations which cost $150,000 bought in for $40,000, and hardly paying a profit even on this minor sum, you will scarcely regard this industry as a thriv-

ing one. There are natural as well as artificial causes for this want of success; but I must reserve the discussion of these for another time. What is certain is that these islands, aside from their fine climate, have absolutely nothing to tempt our own people to live on them, or to invest money in them. The native, who lives on poi, bananas, cocoa-nuts, and fish, can always do well here; but the extent of agricultural land is so small, and what there is lies at such serious natural disadvantages for transportation, that the man who means to raise something to sell has no chance. More than one-half the surface of the islands is lava, which may, I suppose, in about three millions of years be worth perhaps a dollar and a quarter an acre. And even for grazing they are not suited, for there is no market for beef or mutton. They are beginning of late to boil down their cattle, and sell their hides and tallow; and a sheep farmer must depend entirely on his wool.

At Kaimu, twenty-five miles from the Volcano House, you sleep in a native house very comfortably, and under cover of the tappa, or native cloth. You must bring with you tea or coffee, sugar, and bread. Sweet-potatoes and bananas, and chickens caught after you arrive, with abundant cocoa-nuts, are the supplies of the place. The water is not good, and you will probably drink only cocoa-nut milk, until, fifteen miles further on, at Captain Eldart's, you find a pleasant and comfortable resting-place for the second night, with a famous natural warm bath, very slightly mineral. Thence a ride of twenty-three miles brings you back to Hilo, all of it over lava, most of it through a sterile country, but with one small burst of a real paradise of tropical luxuriance, a mile of tall forest and jungle, which looks more like Brazil than Hawaii.

Near Hilo are some pretty water-falls and several sugar plantations, to which you can profitably give a couple of days, and on another you should visit Cocoa-nut Island, and —as interesting a spot as almost any on the islands—a little lagoon on the main-land near by, in which you may see the coral growing, and pick it up in lovely specimens, with the stones upon which it has built in these shallows and protected waters. Moreover, the surf-beaten rocks near by yield cowries and other shells in some abundance; and I do not know any where of a pleasanter picnic day than that you can spend there.

Finally, Hilo is one of the very few places on these islands where you can see a truly royal sport—the surf-board. It requires a rough day and a heavy surf, but with a good day, it is one of the finest sights in the world.

The surf-board is a tough plank about two feet wide and from six to twenty feet long, usually made of the bread-fruit-tree. Armed with these, a party of tall, muscular natives swim out to the first line of breakers, and, watching their chance to duck under this, make their way finally, by the help of the under-tow, into the smooth water far off beyond all the surf. Here they bob up and down on the swell like so many ducks, watching their opportunity. What they seek is a very high swell, before which they place themselves, lying or kneeling on the surf-board. The great wave dashes onward, but as its bottom strikes the ground, the top, unretarded in its speed and force, breaks into a huge comber, and directly before this the surf-board swimmer is propelled with a speed which we timed and found to exceed forty miles per hour. In fact, he goes like lightning, always just ahead of the breaker, and apparently down hill, propelled by the vehement impulse of the roaring wave behind him, yet seeming to have a speed and motion of his own.

It is a very surprising sight to see three or four men thus dashed for nearly a mile toward the shore at the speed of an express train, every moment about to be overwhelmed by a roaring breaker, whose white crest was reared high above and just behind them, but always escaping this ingulfment, and propelled before it. They look, kneeling or lying on their long surf-boards, more like some curious and swift-swimming fish—like dolphins racing, as it seemed to me—than like men. Once in a while, by some mischance the cause of which I could not understand, the swimmer *was* overwhelmed; the great comber overtook him; he was flung over and over like a piece of wreck, but instantly dived, and reappeared beyond and outside of the wave, ready to take advantage of the next. A successful shot launched them quite high and dry on the beach far beyond where we stood to watch. Occasionally a man would stand erect upon his surf-board, balancing himself in the boiling water without apparent difficulty.

The surf-board play is one of the ancient sports of Hawaii. I am told that few of the younger generation are capable of it, and that it is thought to require great nerve and coolness even among these admirable swimmers, and to be not without danger. For the sketch of it which accompanies this article, as well as one of Kilauea, I am indebted to the skillful pencil of Lieutenant-Commander William Bainbridge Hoff, of the flag-ship *California*. In going about the Hawaiian group the traveler must take with him every where saddle and bridle and horse furniture complete. A horse you can always hire or buy; but you are expected to have your own saddle. Thus you see the little steamer's hold, when she leaves Honolulu, contains few trunks or large bags, but a considerable collection of saddles and saddle-bags.

JOHN BLYTHE'S NAMESAKE.

JOHN BLYTHE and the minister were walking down town together. John always walked, having nothing to ride except his hobbies, which his friends declared he rode to death. But there was such an ever-increasing stud of those unpopular and costly racers that he was never without half a dozen reasonably fresh ones. And one of them, however hard-ridden, came up, unbreathed and active, for service every day. John could not remember when he had not been absorbed in the hope and the work of reforming prisoners, and of saving from crime the street Arabs who become prisoners. When he was six years old he had been permitted a birthday party, with the precious liberty of inviting the guests "himself." But when the afternoon arrived, his unsuspecting mother found her pretty parlors invaded by twelve little gutter-snipes, not much cleaner as to vocabulary than as to person. John grew more and more radiant with delight at each grimy and slinking arrival, so that his mother had hardly the heart to call him to account. And when she took him apart to say, "Johnny, how could you bring those dreadful boys into mamma's nice clean house?" he looked up with such pained amazement that she was silenced. "Why, mamma," he said, "you told me I might invite which twelve little boys I choosed, and I choosed these, 'cause I knew they didn't ever go to a birthday before." Mrs. Blythe felt an uneasy apprehension that practical Christianity might be a little uncomfortable in general use. But remembering a certain Divine prescription of the etiquette pertaining to a feast, which insisted on the bidding of them who could not bid again, she only said, "Well, Johnny, tell mamma beforehand next time. And now we must take all your little friends up to the bath-room and give them a scrub, before they play with the toys."

Which very remarkable attention the young vagabonds received, by means whereof they would have remembered the day forever as set apart from all others in their limited experience, had it not also been set apart as a bewilderment of games, cakes, beautiful surroundings, and double handfuls of candy as a sort of stirrup-cup.

The John of six-and-thirty was hardly more conventional and no whit more selfish than the John of six. And now he was urging the minister to take up a scheme of his for deporting certain bad characters to a new field, where he believed they would reform. "You are too hard on them, Egerton," he was saying, in his vehement way. "I tell you, we make 'em thieves and keep 'em thieves, and then shut 'em up, because they are thieves, in places where they shed their thieves' skin and come out something worse. It's the logic of events. I've got some friends in Rag-pickers' Row: carriage people: drive a dog in a soap-box, these aristocrats. Sometimes I drop in there when I think the world is too careless of my high mightiness. It's a nasty cure for peevishness, but thorough. The Row has its water view—a mud-puddle that is never dry, inhabited by an ague that's never at home, but always out calling in the neighborhood. The rooms are ten by twelve, a family in every room, and at least ten souls, or cases for souls, in every family. The lower the breed, the larger the litter always. What do these creatures breathe? Air? No: stinks! What do they eat? Food? No: garbage! What do they wear? Clothes? No: rags and infection! What fluid is in their veins? Blood? No: poison! What do they do? Live? No: putrefy, body and bones, heart and brain! The brats are turned into the street as soon as they can toddle, to beg or steal. They get into the Tombs, of course, and on the Island, and so to Sing Sing, and so to a bad death. In short, they're born in hell, and live in hell. And I declare to you again that I don't believe a just and tender Father will give them hell hereafter till they've had at least a chance."

"My dear John," said his friend, "you can't wash convicts clean in baths of sentiment. You yourself wouldn't trust a convict's repentance without long probation. There's a great deal to be said on the other side; but this is my corner, and I have work to do. I'll consider the question, and help you if I see my way."

Blythe turned down a quiet cross-street, and was startled out of his meditation by a woman's scream. At the same instant a man, stumbling up the steps of a deep area, ran violently against him. "Not so fast, friend," said Blythe. "It's not polite to run away when people want your company. We'll just turn in here and see for which of our virtues we are thus desired." There was no shaking himself free from the strong grip of his captor, and the man obeyed.

"What's the row, my girl?" said Blythe to the servant at the window.

"Oh, the black thafe!" she cried. "Sure I set me spoons on the winder-sill, and it open a minute wid the dust, and me sweepin', and the blatherin' thafe he rached in an' tuk 'em, and me ketchin' him in the act."

"Search me," said the man, quietly.

It was early. Nobody was in the street. Blythe took the man into the area, and turned his pockets inside out. Not so much as a pawn-ticket appeared. "Friend," said he, "I must trouble you to take off your boots."

The man laughed uneasily. "Game's up," he said. "Take your spoons, watchful Bridget. I'm to go to the jug, I suppose. Who cares?"

"Are the spoons all right, my girl?" asked the amateur detective.

"An' why not, thanks to yer honor, and bad cess to the murdtherin' rogue, to be takin' yer honor's time. And I'll take me book oath agen him whenever yer honor says."

"All right," said Blythe. "Good-morning. Come with me, my Turpin bold."

The man went quietly for a few paces and then stopped. "What are you going to do with me?" he said.

"Well," said Blythe, "either put you in nomination for civic honors, as alderman, for instance, where your talents wouldn't remain hid in a napkin, or give you in charge, I think."

"Couldn't you kick me, Sir, and let me go?" asked the man, eagerly.

Blythe laughed aloud. "Corporal punishment, as opposed to moral suasion, eh? Well, perhaps. Where do you live?"

His captive studied his face. It was so open and kindly, the laugh had been so hearty, that he said, suddenly, "I wouldn't like to lie to you, Sir. I don't live any where. I come out of jail for the third time last Tuesday. I'm a regular jail-bird, I am, and I don't expect to be nothing else. I'm too old. And I don't suppose it matters how soon I go back." The man's voice was steady enough, but his lip twitched a little.

"Then you didn't breakfast at Delmonico's this morning?" said Blythe.

"I didn't breakfast nowheres these two days, Sir," replied the prisoner.

"My young friend," said his queer keeper, "I have ever observed throughout my virtuous life that when there is a chronic emptiness of the stomach, there is a corresponding shakiness of the moral nature. Here is my card. Will you do me the honor and pleasure of breakfasting with me?"

The amazed convict replying not, was forthwith haled to a cellar-restaurant, where, having ordered half the bill of fare, Blythe sat back in his chair complacently observing the famished eagerness of his human wolf. When even the chronic emptiness was temporarily filled, the wolf said, sheepishly, "I don't mind telling you, Sir, since you've acted so handsome, that I wouldn't have took them spoons if I hadn't ha' been just starved. That ain't no excuse in the courts, I know, and I expect to go up for it; but I thought you'd kind o' feel as if you hadn't wasted your money so bad if you knew how holler I was. I'm ready now, Sir, if your time's up."

"Not quite up," said John. "Suppose you tell me how it began. Perhaps I could speak a word for you. I'm a lawyer."

The other stared with surprise. "A lawyer," he said, "and give away a breakfast like that! That beats cracky! But there's nothing to tell, Sir. I'm a wheelwright. I got sent up the first time for being drunk and disorderly. I lost my place, and then come a strike, and no work; and I took a nip sometimes, and got sent up for petty larceny. And I sort o' slipped into the thieves' ring; and byme-by I got a three years' term. But I was sick of the business, and I worked hard and kept the rules, and got a good name. So when I come out, I goes to my old shop to get work; and, thinks I, 'tain't fair to the boss not to own up, 'cause he might have hard words heaved at him by the rest of the hands if they found it out. And so he wouldn't take me; and none of the other bosses wouldn't, 'cause I told 'em—for, thinks I, 'taint no use to pretend you want to be honest with a lie on to your tongue. So then I tried to get porter's work, and other things, but nobody wouldn't take a man without a character. I don't blame 'em. I s'pose I shouldn't myself, if I was them. Well, I hadn't no money nor credit, but I used to want my victuals just as regular as though I had good wages; and so I took a watch, and got sent up again. I'm a pretty decent chap in jail, you see. I don't get no liquor, and after a little I don't want it. And I'm a proper good workman. And the warden he used to let me have the picture papers on Sundays—*Harper's Weekly*, you know, and the rest. And I made up my mind again that I'd just be a new man when I got out. So I did get out last Tuesday, with these clothes and two dollars, and a nice new knife that the warden give me. So then I tried right off for work. And when the boss says, 'Where did you work last?' I says, 'Come, now, I won't tell you no lies. I worked at the prison; I'm a convict.' And then 'twas the same old story. So I sold the knife and a handkerchief, and the last of them and my two dollars was eat up and slep' up night before last. So yesterday I didn't have no victuals; and I thought maybe I'd go to some minister and tell him. But ministers ain't much in my way; and, besides, I didn't want to beg—I wanted to work. So I walked round all night last night, 'cause I couldn't go into them holes to the station-houses to sleep—I know 'em too well. And when I see them spoons waiting in the winder this morning purpose to be took, I couldn't hold out no longer. I didn't expect to get nabbed; but I guess I didn't care much. And that's all," said the man, pulling up suddenly. "I guess having to hold your tongue so much up to the prison kind o' makes it run at both ends when you get out. And I beg your pardon, Sir, for doing of it. But, if it's the same to you, I'd ruther push along to the station; for talkin' with you sort o' makes me hate to go back again." And he looked—this hardened convict—quite capable of human tears.

"I've concluded," said Blythe, quietly, "to transport you instead."

The man jumped up. "Why, that ain't American law, is it?" he cried. "Why should I care, though? Just as you say, Sir. You've treated me fair, and I don't doubt you know the law."

"It's Gospel, if it isn't law," said Blythe, heartily. "What is your name, my friend?"

"John Brand, Sir; but the name's a brand to me now, and if I'm to be shipped, I'll take another, if it ain't against the law."

"All right," said his sponsor: "take mine, 'John Blythe.' It's a good, honest name, and I'll trust you to keep it so. You're going to Philadelphia to a friend I have there in the carriage business; big house; good wages; chance to rise. I write to him and tell him all about you in a letter you take. He is not to report to me. If you do well, you'll be glad to let me know it yourself. If you don't, I'd rather not know it at all. I'll have no spies upon you, and I'll trust you to keep faith with me. You'll want another suit and ten dollars in your pocket to make you feel respectable. So now we'll go and get fitted, and buy our ticket, and take our rather damaged wares to a new market."

When John Blythe went home that night he laughed a little to himself to think how many of his investments in wild-cat humanity had brought back no dividends. But he always had faith in the last one. "The truth is," his mother had told the minister that morning, when she begged him to withhold her son a little from his prodigal benevolences—"the truth is that John regularly strips himself once a month or so for some plausible scamp. Three times this season has he come home without a waistcoat. And I fully expect to see the day when he will have to lie in bed to have his only shirt washed, his opulent beggars having pawned all the rest."

Blythe still lived with his mother, because he felt that no other woman would be happy with the perplexities which his constant experiments in sociology entailed on his household, and because he had never found a woman whom he could ask to share that poverty which might so easily have been wealth had he chosen to conduct his moral book-keeping according to received usage. In this new rogue he had taken much stock, as he said. The man was not only certain to reform, but to save hundreds of men like himself, whom he would know how to reach. But after one brief, ill-spelled, and dirty note to say that he had found work, and a friend in his employer, he made no sign. And when a year or two of silence had convinced even Blythe that the taint of ten years could not be cured by an hour's kindness, he only said, "Well, poor fellow, I ought to have kept him under my own eye. There was good in him. But I suppose life was too hard."

So eight years went by, Blythe going his daily round of unostentatious duty, never dreaming that he was a saint in shabby vestments, and only seeing that each day he let slip some chance of helpfulness which he might have seized. His business had not thriven as he had hoped. Men were a little shy of such a Quixote, genius though he was; and he was so certain to refuse cases where the right was not clearly on his side that his fees grew fewer year by year. It was hard, because he saw such good that might be done with money. But he only pinched himself the more.

There came in time a cholera summer. People fled the city in herds. Almost nobody was left, save the wretches who could not fly, and whose poverty, ignorance, and dirt predetermined them victims. By day and by night, in the stews and slums of the town, horrible in the August heat and stenches, John Blythe watched and worked. His perfect health, which seemed to place him beyond peril of infection, his skill in nursing, his tenderness, and the quiet courage which roused an answering courage in the affrighted victims, made him invaluable to the doctors. He often met one other volunteer nurse, not less invaluable than himself, the physicians said. But beyond civil greetings they had neither time nor thought to bestow on each other.

But one morning as Blythe left the hospital, after a hard and weary night's work, he overtook his silent fellow-worker. The latter lifted his hat, and as the clear early light fell on his face it looked so familiar and so friendly that Blythe stopped, saying, "Surely I must know you, my good Sir?"

"Yes," said the stranger, heartily, "you are perhaps the only person who ever did know me. Our acquaintance began in a breach of good manners on my part, for I asked an important personal favor before being introduced. You may remember being solicited to kick me and let me go on a morning much like this!"

John Blythe, the first of the name, dragged his namesake into a friendly doorway, within whose shelter he first fell on his neck and kissed him, and then sat down on the very dirty stairs and cried. John Blythe, the second of the name, leaning on the balustrade, also cried.

The sponsor was the first to recover his speech. "History repeats itself," he said. "Twice found in the street, and a second time to be invested in my clothes—for we can't take breakfast in these—and again to break the bread that precedes a new career together—for I never will let you out of my sight again, you rascal—and once more to set you up in other business—for now you are to be your own biographer, and tell me tales of yourself for a thousand and one nights. But be pleased to hold your tongue till we have both bathed and eaten, or we

shall both be down with the cholera, and the two best nurses too engaged to attend to us."

But when they had refreshed themselves with water and fresh linen, and had eaten their breakfast together in the cellar-restaurant where they had first adopted each other, the elder entreated the younger to speak. "My boy," he said, "we shall have observed the dramatic unities in a way to satisfy Dr. Johnson himself, when in that very chair you tell me your story. Come, now—*Enter John Blythe, second, solus, loquitur.*"

"I'm almost deaf and dumb with joy, Sir," answered his namesake, "and I'm afraid that I'm not a much better fist at talking about myself than I was when you first invited me to do it, and made a man of me. I have often thought of late that I had done wrong not to write. But the truth was that after I had written you that I'd gotten a hold on life again, it seemed a little contemptible to be hanging on to you, even with letters, when I could stand alone. And I was afraid you might think I wanted money, or notice, or the help of your name, if I kept reminding you of me. I think now it was pride, but then I thought it was humility. And I set up a certain stint to myself to do before I would write again. I told you I was an extra good workman. 'Well,' I said, 'I'll get extra good pay, and then I'll write and say that deeds are a better coin than words to pay one's debts in, and that I've got some of this good tender to show how grateful I am.' Of course I had to begin low, and work up. And I felt my ignorance, and got books, and studied every night and Sundays. That was much the toughest job of the two, the book-learning. But Mr. Bradbury watched me for your sake, and when Mr. John was at home in vacations he used to come down and talk to me, and when he found that I was trying to improve myself, he offered to help me, and after that I got on famously. Presently I saw that it all depended on me how soon I should be made foreman, and I worked like all possessed, meaning to write to you as soon as I got the place. Having no expenses to speak of, I began to lay up money from the first, and a perfect greed of getting and saving took hold of me, for I wanted to astonish my astonishing godfather with the amount of it. But Mr. Bradbury was buying land here and there in the suburbs where he knew the horse-railroads were going to put it up, and he said to me, 'John, if you choose to risk your money in land, I'll buy for you as I buy for myself, and I think we shall make a good thing.'

"Well, of course I did choose. And, what isn't of course, we did make money hand over hand. And it seemed as if I was foreman in no time. And then I thought, 'No, I won't write just yet, for the signs are that I shall be manager. Sure enough, that wasn't far off either. For the young gentlemen didn't like the business, and the old gentleman was wrapped up in it, and couldn't bear to think that it would go all to pieces when he should die. So he pushed me, and I pushed myself, and every wind that blew seemed to fill my sails. My money just rolled over like a great snow-ball. And the harder I studied, the clearer my head grew and the easier it seemed, though I found out, like Mr. Boffin, that there were lots of 'scarers' in print.

"Well, I hadn't more than turned round, it seemed to me, after I was manager, before Mr. Bradbury sent for me again, and told me that I was so well up in the business, financial and mechanical, that he was prepared to offer me a junior partnership if I liked. I don't suppose the Emperor of Roosha thinks half so well of himself as I did then, Mr. Blythe. But, after all, it wasn't the success itself that I cared about, but just the bringing of it back to you, and saying, 'It's all yours, Sir; the credit of it, and the money, and the man that you made out of a vagabond with your heavenly kindness.'

"So then I sat down and wrote you a letter, and told you all of this long story. But when it was done, a great light fell on me, as it did on Paul. And I saw that, after all, I was going to make you a miserable return. For I had just settled right down, and grubbed for money and grubbed for learning, just to make myself a little worthier to be your friend, and a little more important in your eyes, and to be able to spend it for you. And I had not made the world really any better off for my being in it. I thought how different my narrow notion of virtue was from yours, that helps every body, for Mr. Bradbury had told me all about you, Sir. And I felt that I wasn't worth shucks. So I tore up the letter, and began to live a different life. I knew well enough that my work lay among the prisoners, and for a year I've done what I could for them. But that's not the point now. Still I didn't feel fit to come back and beg you to live with me, and that was the dream of my life. I was possessed to do some tremendous thing, like saving a family from a burning house, or from a wreck, maybe, at the risk of my life. And I was in that mood when the news of this awful cholera came over, and I saw my chance. I knew that you would be in the worst of it, and in my thoughts I saw you meeting me, and being so pleased and astonished. Well, I came; and I saw you the first day, and you didn't know me. I had never thought of that chance. And it was a kind of blow to me, for it seemed as if you had never been out of my thoughts, sleeping or waking, and I felt clean forgotten. So I made up my mind not to speak till you knew me, unless you should get the sickness, or I should. But just to see you every day has been new life to me. And

that's all," he said, laughing like a boy at his own tears.

John Blythe never knew what he said in answer. He talked almost as long as his namesake had done. He planned a little holiday that they should have together when their nursing was over. And when they rose from the table he said, with quaint reverence, "John, henceforth there is a new sacrament for me. It is the Lord's breakfast, for I shall always believe that the risen Lord has twice sat with us at meat."

"Most folks would think He'd lost His way," said the other, "to sit down in a cellar and eat with a convict, where there was no table-cloths nor silver forks; but I guess, Mr. Blythe, He'd go most any wheres you go, because you're just one of His kind. I'm on duty at eleven o'clock, and I must put out. But a few hours of parting don't matter to a man who's had so many years of it. And we can have dinner together, can't we?"

"All dinners and all breakfasts, dear son of my love," cried Blythe. "We shall live together now, and help one another. I shall come down to you as soon as I have had my sleep."

But when he ran up the hospital stairs that afternoon, thrilled with his new joy and strong with its strength, he found the house surgeon waiting for him. "Mr. Blythe," said he, "we've had our worst stroke of luck this morning. That capital nurse—by-the-bye, queerly enough, his name is Blythe too, I find—is down with the disease, and it will go hard with him. He has had some great excitement to-day. I saw it the instant he came in—eyes all aflame, face perfectly transfigured, hands trembling. He is not strong. Early dissipation, I reckon, and overwork in business. And lately this awful hospital duty, and the devil's own heat besides. When a strong excitement was added to those strains he broke right down. I stopped you to tell you that you must take care of him, and that if you can get him to tell you what is burning him up, it may save his life, though I doubt. And talking's a bad remedy too, for he ought to be quiet."

"But I know what it was that used him up, and he trusts me. Then what?"

"My dear fellow, then we may save him. We won't give him up."

But the poor soul that had never known a childhood, nor an unstained youth, nor the love of woman, nor the kiss of little children, was to begin the new life where all these, or their recompense, might await him. He did not talk. He was content to lie still and look at John Blythe's face. But at the last the chaplain stood beside him too. And when he asked, "Do you trust in the mercy of God, dear brother?" the fading eyes looked with unutterable love in Blythe's, and the spent voice said, clearly, "He gave His angel charge concerning me to keep me up, lest I should dash my foot against a stone." Then they left the bedside, for the living needed them.

He had given his papers to his friend, and among them was a copy of his will. In token of his love he had left all his property to "John Blythe, for whom I was named, and to whom I owe all that I have and am." It was a legacy that grew in bulk day by day, and made many an abject creature happier. And it is still, in other hands, doing its good work, though the last earthly record of the two obscure lives whose gift it was is written on a little slab in Greenwood, thus:

SACRED TO THE MEMORY
of
JOHN C. BLYTHE:
and of
JOHN BLYTHE,
HIS BELOVED NAMESAKE.

TEN YEARS AMONG THE ROWING MEN.

BY WILLIAM BLAIKIE.

NEAR the heart of Massachusetts, and not far from the Worcester hills, two or three little brooks come together and form a stream, which, soon widening into a river, commences somewhere to be called the Charles; and quietly wending its way along, here taking a turn through the Waltham of Banks (N. P. Banks, of course) and watches, and there passing by Watertown's arsenal, Lowell's Elmwood, and Longfellow's stately mansion, runs almost up to the door of the first university of America, and then turns away toward the good old city which has done so much to bring to all New England—and more than New England—honor and renown. But, singularly enough, instead of entering, it avoids it altogether, just stopping a moment for a look at Bunker Hill, and then, uniting with the gentle Mystic, goes away down to the sea. The broad basin into which it opens directly back of Boston has long been the training course of Harvard University, and that city also, quicker than any of her sisters to see the attractions of a well-ordered boat-race, has almost regularly, during over twenty years, made this same stretch of water contribute to the festivities of the anniversary of the nation's birthday. Local crews, and often distinguished strangers, took part in these contests, and undoubtedly thus did much by their rivalry toward keeping the

students vigilant and ever trying their best. Steadily improving boats, and oars too, noting the mistakes of their antagonists, comparing their various styles of rowing and methods of training, and yearly accumulating traditions and experience, have all combined to make Harvard a most generous contributor to the amateur rowing of America; and when the unequaled proportions of the inter-collegiate regatta of this year are considered, most deservedly does she come in for a liberal share of public notice and good-will.

Yet, notwithstanding these advantages, the fondness of her oarsmen, in common with a great majority of those all over the country, until very recently at least, for the old and most objectionable methods of training is surprising. Men would be required to turn out and run, walk, or row long distances before breakfast, when for twelve hours or more they had eaten nothing, and would come back faint and half famished, and with that all-gone feeling that work under such conditions brings, and which would frequently stay by them all day. Then their bill of fare would contain little else than underdone beef and mutton, stale bread, a very stingy allowance of potatoes, and none at all of any other vegetable; sometimes tea, never any other drink but water, and one tumbler of that for breakfast, two for dinner, and one for supper, and not even this much if they could possibly do without it, and with nothing at all between meals; and this no matter how fierce the heat and how severe their work.

No wonder that, with such lack of variety of nutrition, sore boils broke out on them, until we heard of one man who had seventy-three! No wonder that men could not sleep, and getting up at midnight, and faithful to their orders, not slaking their burning thirst, would bathe their heads and necks for the relief it brought! No wonder that men rebelled, and wet their lips occasionally when the law said no! We had the pleasure of rowing once in the same crew with a man who told us that during the whole six weeks of training he had not drank one drop of *any thing!* Is it strange that a great abscess burst out on his thigh, and that he rowed his race while in such a fever that his physician had the day before ordered him home to bed? To be sure, he did more than was required of him; but could the system that encouraged such madness be right?

And, not contented yet, men have been known to think it necessary to bundle up unusually, and work until in a reeking perspiration, purposely to reduce their flesh; and, from personal experience, we can say that a more weakening process for the ordinary man can hardly be devised. This barbarous custom came from such wisdom as one found in *Boxiana* and works on training in by-gone days, and perhaps for the men it was meant for—prize-fighters, sporting-men, and their associates—it was well enough; for a hearty fellow, long used to loafing about bar-rooms, and by his unrestrained appetites adding daily to his weight a puffy, beer-soaked sort of flesh, might find his body none the worse for, and his sensual nature cooled by, heavy sweating between feather-beds, and by long walks and runs with top-coats wrapped about him.

But to nearly every man who trains today for a boat-race, and particularly here in America, where most young people at least find it easier to get thin than stout, much of this overheating is of no benefit, nor else than a positive hinderance to the effecting of their purpose. Take the clerk, the student, the mechanic, or the young professional man as you find him, and put him through the course of training as now followed, and the chances are more than even that he will gain weight or, technically speaking, "train up." This will be especially so if he has for a while back been using his muscles but little and his brain too much, or has been irregular or dissolute in his habits. But if he has been careful all along to take a good, generous piece of exercise daily, it hardly matters of what sort if it be out-of-doors, and sleeps plentifully, he will find his weight almost unchanged, particularly in the cooler times of the year. Had Dickens, for instance, with his six or eight or ten miles of daily walking, at a gait that it needed a practiced foot to long keep him company, taken a notion to extend his trip until he had walked all he could for a week together, it is doubtful, unless the weather was extremely warm, if he would have lost weight very perceptibly by the operation. In a tramp we once took from Boston to New York, covering the distance in five days, with three hours to spare, doing fifty-seven miles the first day and averaging forty-five throughout, only four pounds were lost, and reasonably good fare, such as would be found on any well-ordered training-table, would probably have saved us a couple of these.

The amount of work, too, that should be done by a man in training seemed all along a matter of conjecture, and one which no rule could govern. You would hear of one crew thinking it a hardship to have to row five miles a day, while another was scarcely satisfied with twenty. We understood that when Hamill was fitting for an important race he would not only often be on the water before breakfast, and always take a six or eight mile pull between that meal and dinner, and a similar allowance before supper, but quite frequently a deal of hard work at the rowing weights after supper. Not only is this manifestly too much even for a man of his great strength, but any where nearly as much is almost sure to bring on a loath-

ing for his work, which will quickly combine with such overwork to defeat the very purpose in view—the winning of the race.

Thoroughly hard, faithful work over an oar or rowing weight reduces one's flesh astonishingly. We have seen a man with little superfluous flesh on him, in a gymnasium just comfortably warmed, after stripping for his work to thin trowsers, slippers, and gauze shirt, and first weighing himself on the scales hard by, sit down to a fifty-five pound rowing weight, and, rowing a clean full-length stroke of about forty-five to the minute, rise at the end of twenty minutes—probably a fair approach to three miles of work at an oar at racing pace—and weigh on the same scales over a pound lighter. And after three miles of sharp work over the course "on time," under a blazing, mid-day sun, when the thermometer stood in the shade among the nineties—a time, by-the-way, when it would have been far wiser not to have rowed—we have seen six men weigh before going to dinner, and afterward turn the scale at an average of three pounds more per man. But they trained on sensible principles, and a goodly share of this increase was doubtless liquid, as men tired and exhausted can hardly help drinking, rules or no rules.

We hold that even to-day men in training are prone to do too much work. When the Harvard crew was in Europe, preparing for the struggle that by its result created such profound surprise, at least among all Englishmen—for the latter had expected them to be beaten from the start, instead of leading probably the best crew Oxford ever had for two whole miles—they would, besides a little walking, paddle about over two or three miles in the morning, and generally go over the track from Putney to Mortlake (four miles and three furlongs) at a racing pace in the afternoon; then, after lying on their oars a little while till they recovered their breath, would start back easily, and often swing into a stroke that gave the horsemen on the tow-path something to do to keep up. And for this they were pronounced by the English press perfect "gluttons" at work.

Their rivals, plumper, rounder, less wiry-looking men, and averaging sixteen pounds apiece heavier, would paddle but a mile or so in the morning, making frequent stops at that to listen to the comments of their "coach," and pull over the course "on time" in the afternoon, but instead of rowing back, give their boat in charge of watermen, and go home by the beautiful little steamer owned by one of them, and from which, as she steamed alongside them on their row up, their coach had given his orders in a voice you could hear almost a mile away. And although thus in the morning doing practically nothing worth calling work, and hardly more than half as much in the afternoon as their rivals, yet seeming better fit for it, their mentor feared that they were doing too much, and not long before the race let them up for a day, and had them down at Brighton for a tumble in the surf.

Here, then, in a country where the interest in rowing is so universal that, as its *Rowing Almanac* shows, the number of races often exceeds in a year even the number of days, where almost every aquatic problem new to us was solved long ago, with all the best light of the experience and traditions of more than forty years, and the pick of all the skillful coaches in England—here some of the very best men her justly famous and oftenest victorious university ever owned, men who looked fit for any thing, confine themselves, when preparing for the most important rowing race the world ever saw, to not more than twenty-five minutes of actual downright hard work each day! Is not the allowance they thus give themselves at least worth making a note of?

Moreover, the English students usually, if we are rightly informed, do nearly if not quite all their severe rowing at a season of the year when their studies exact comparatively little of their time, and thus the achievement of even the highest rank and honors are not, as has been more than once proved, incompatible with prominence on the river. But the American who wants to row a race, if he is yet a student, is very apt to find numerous examinations coming on at just about the time most convenient for the racing; while, if in business, he will attempt to prepare himself for his task after business hours, when he is of necessity more or less worn down by the labor and annoyances of the day.

Take a hot, hard pull of an hour or more, at a fast stroke, with scarcely any let up, and a keen, wonderfully plain spoken fellow up in the bow, or on the cockswain's seat, or riding close alongside, and ever paying his addresses, as you think, almost entirely to you and the defects in your work, and this in the presence of others who can see the fitness of his comments, or do fifty or sixty miles over country roads between daylight and dark, and it is a rare possibility that you will be ready that evening or next day to grasp swiftly some important and complicated question of business or study, and find your memory as ready and retentive as it would otherwise be.

With the explosion of the notion so long prevalent that a man who had an arduous physical task before him must get himself down almost as thin as he knew how, and with the discovery that a little extra beef helped rather than hindered him, and seemed a capital left him to draw on, particularly toward the end of a long race, has come the natural result that gives him such capital—namely, the keeping up the supply of

food and sleep that build him up, and the lessening of the work, and consequent wear and tear of body and nerve, that take him down. It has been found that he may eat about any thing he likes; for the trying work he has will so sharpen his appetite that he will like the most solid food, and as he is sure to eat plenty of it if it is set before him, any fondness he may have for less nourishing dishes may be safely indulged.

We have seen put together four midshipmen, averaging scarce twenty-one, and who had never had much rowing; and though required to turn out at half past four in the morning—for from six to six their duties demanded all their time—and forever nagged at, till their backs at last got straight, and they fell into some approach to form, they uttered no breath of complaint. Nor would many evenings go by without their having to pull at their best over three measured miles, and sometimes they did it in nineteen minutes. By-and-by Coulter brought down from Philadelphia the picked crew of the Schuylkill navy, and threatened to make short work with the poor rash middies, dropping occasional remarks in a patronizing way about this or that defect in their work, and referring to their tender years. But the latter kept their own counsel, and when the day of trial came dashed away from the enemy at the very start, and taking a commanding lead, kept it all the way over the course, coming in easy winners, four or five hundred feet ahead, and this though their bow-oarsman had cracked his oar while turning the half-way stake, and so was forced to do lame work all the way home. Well, they dined the vanquished soon after the race, and on the well-laden table their hospitality had provided were high glass dishes, broad, deep, and roomy, and filled with luscious strawberries. The Philadelphians were so attentive to these as to cause remark, when the fact came out that they had been for weeks fed on the old plan, and besides meat and bread, had eaten little else. But all this time the winners had had all the strawberries they wanted, besides tomatoes and whatever other vegetables were to be had, and so now cared nothing especially for them. The former had gaunt, hollow cheeks, and the generally overworked look that such narrow diet begets; while any one of their rivals had plenty of flesh on his face, and a comfortable, hearty look.

We found on the table of the English crew above mentioned plenty of fresh oranges, and large juicy grapes, while each man seemed to have about all the beer he wanted.

Almost invariably, too, crews trained on the spare plan are afflicted with boils, while after a careful observation of nearly all the best rowers, professional or amateur, this country has yet produced, and of many of the foremost oarsmen of recent years of the former, and not a few of the latter class, in England, and an experience of some four thousand miles of rowing and much racing during our four years at college, we feel confident that men fed on a liberal and varied diet, and not unreasonably restrained in the matter of unstimulating drink, are free from these annoying and often very weakening visitors. We say unstimulating drink, for it is pretty well understood that any thing else is a hinderance rather than a help to a man cultivating endurance. We record our belief that no other drink yet found will do the man in training, or at any physical labor, so much good and so little harm as cold water.

How should a man distribute his work and rest, if required to train for four or six weeks together for a boat-race of any length, starting on the supposition that he is in fair health and has no organic defect?

On rising, let him take a sponge-bath in tepid water, and be as quick about it as he can; then rub himself as vigorously as his hide will stand with coarse towels or strap until, if he can bear it, he is ruddy all over.

If he feels equal to a little exercise before eating, let him take it with such clubs or dumb-bells of moderate size as he can handle easily. But let it be only a very little, for a man who has eaten nothing for twelve hours is unfit for severe physical effort; and it had better be taken in-doors, especially if there is the slightest malaria in the air, or if it is at all cold without.

Then very quickly afterward he should have a hearty breakfast, and provided he will eat a good allowance of well and invitingly cooked beef, or mutton, or pork, or fowl, it matters little what favorite dish he may add, if none of them contain any stimulant. Particularly should he have whatever vegetables are then seasonable, and for which he cares, and have them served to his liking, while he can scarcely eat too many eggs.

From now till dinner-time, if that comes in the middle of the day, he had better not, save three or four miles of smart walking, do much hard work, unless his race is to be rowed during this portion of the day; for it is a capital plan to so distribute the day's work as it is likely to come on the important day itself. But two or three hours after eating, taking care to avoid exposure to extreme heat, let him go out for a paddle, and such instruction as suggests itself to a careful and experienced "coach;" for few men row so well that they need no teaching, and the best rowers will generally receive it most willingly. We say a paddle, for a man learning to row must never go fast. He wants first to get the point to be learned thoroughly into his head, and then it is easy work for his hands. But drive him, and row him hard, and he soon finds, as in any other severe muscular work, that it is very

difficult to think quickly, and it may take him months or even years to acquire knowledge that judicious management and restraint would have brought him in a few weeks. On his return to the boat-house he should have a good rub, and then at least half an hour's rest before dinner.

This should, of course, be the most substantial as well as the most attractive meal of the day, and the man should be allowed, as is often not the case, to eat all he wants; for surely he who takes much out of himself ought to be allowed ample material with which to rebuild. Together with the variety of meats already named, and adding game and fish, we repeat that he ought to have at least a sparing allowance of any vegetables in the market for which he has a liking. This will remove the craving that every one knows well who has trained, for instance, in strawberry-time, when he was not allowed to touch the delicious fruit. And we are ready even to go so far as, if he has a marked weakness for some favorite pie or pudding, to let him try that too, on condition that there is nothing stimulant in its composition.

If supper comes within three hours of bed-time—and tired men are not fond of sitting up late—meat had better be omitted, unless trial has shown the man that he finds himself better with it. But in the long list of simple dishes that can be prepared from wheat, hominy, oats, corn, rye, buckwheat, and a variety of inviting fruits, it will not be difficult without meat to make this meal quite palatable, while if the man is at all inclined to be thin, he need not be shy of the milk.

Then, too, it should be remembered that a person doing each day all the physical work of which he is capable soon finds his digestive powers wonderfully active, that he enjoys his food with a keen relish, and that, eat almost what he will, he will be conscious of no unpleasant feeling from it; and if he ever knew any thing of dyspepsia, he will wonder why he had not thought of this remedy sooner, so complete and effective is it generally.

Between meals nothing had better be eaten, the stomach thus getting adequate rest for the large amount of work it is called on to do.

Of course, if dinner comes late in the afternoon, a person doing much athletic work needs a stout lunch at noon. The Oxford crew, for instance, on the occasion already mentioned, dined after their afternoon row, and when, save rather a brisk walk for a short distance in the evening, their day's work was done; cold beef, bread, and beer, we suppose, being their noonday fare.

Although the sluggish feeling which is apt to follow a hearty meal and hard work may tend to drive one off early to bed, he will nevertheless find that he can sleep; while if he were not tiring his muscles so much, he could not. And in the matter of sleeping, we believe in falling back on one's common-sense just as well as in eating. Let the feelings dictate the time of retiring and rising; for if he gets all the sleep he wants, and feels thoroughly rested, even though it gets on to be nearly midnight before he turns in, he will, we take it, soon discover the fallacy of the old saw about one hour's sleep before midnight being as good as two after it.
